Meanwhile, estimating of diameters and heights, checked by instruments, formed a daily practice. Then in order to secure an idea of estimating density of stand, countings were made on small circular sample areas, laid out by pacing, and the results of countings by different men compared. When only one-quarter-acre areas were taken (58 feet radius) the counts tallied pretty close to each other, but when extended to one-half and whole acres, the difference became considerable. Then countings were made on measured sample plots, laid out in various ways, and finally a careful count and diameter measurement with caliper on a sample acre carefully laid out were made, giving the following results:

Red pine, d.b.h., inches..	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	
Red pine, No. trees	3	15	16	30	21	32	30	35	30	12	11	5	3	2	1	1	1	
																		247 trees
White pine, d.b.h., inches. .		6	7	8	9	10	11	12	..	..	15	16	17	18	..	..	..	
White pine, No. trees..... .		6	..	3	..	..	1	4	..	..	1	1	1	1	..	..	..	
																		18 trees

Total basal area red pine, 164.4 square feet, average basal area, 0.685, whence from table of areas of circles, the diameter of average tree=11.2 inches.

There were, then, on the whole acre 265 trees, a remarkably fine stand, about half of which was of merchantable saw timber size. By a careful calculation of the cross section area corresponding to the diameters it was found that the diameter of the average tree was 11.2 inches. Such a tree was then felled and sectioned into 8-foot lengths, to determine more precisely its volume and to get other data of interest as regards rate of growth applicable to the stand as a whole.

The sample tree of 11.3-inch diameter was found to be 135 years old, its total length 85 feet, 64 feet of which were merchantable, i.e., over 6 inches in diameter; 48 feet was clear of limbs; the per cent. of bark was 4.5. Its volume inside bark was 29.9 cubic feet; its merchantable contents 63 feet B.M. by Doyle rule, and 126 feet B.M. by Scribner rule. The total cubic contents of the sample acre with 265 trees was therefore $265 \times 29.9 = 8{,}022$ cubic feet.

Some other trees (windfalls), of larger diameter, were also sectioned and measured. A 13-inch tree, 89 feet high and 145 years of age, being found to have a total volume of 43.79 cubic feet, 42.11 cubic feet of which was merchantable (64-foot logs) figuring according to Doyle rule, 119 board feet; according to Scribner rule, 265 board feet, the former rule making hardly 3, the latter more than 6 board feet to the cubic feet of forest grown material.

On this tree the rate of height growth was also determined, being 20 years for the first 18 feet, 22 years for the next 16 feet, and continuing at a rate of about 1 foot per year for another 32 feet, then declining to 2.5 to 3 years per foot of height growth.

Finally, a rainy day was used to tabulate all the data and calculate the contents of the sample acre for which the data had been collected as representing the best condition. This gave the following interesting results which exhibit the difference in the different log rules, the International rule being undoubtedly the one nearest the actual truth.

It should, however, be understood that the International rule is based upon ⅛-inch kerf, while the other rules are probably figured with ¼-inch kerf, and in order to make the International rule comparable to the others about 10 per cent. needs to be deducted from its readings.

Contents of a Sample Acre

Diameter	Logs.	Cu ft.	Feet Board Measure per log. Intern'l.	Doyle.	Scribner.
6 inches	121	3.1	20	4	18
7 inches	114	4.3	30	9	28
8 inches	109	5.6	45	16	32
9 inches	108	7.0	55	25	40
10 inches	83	8.7	70	36	50
11 inches	62	10.6	90	49	65
12 inches	33	12.6	105	64	79
13 inches	16	14.7	130	81	97
14 inches	4	17.1	150	100	114
15 inches	4	19.6	175	121	142
16 inches	3	22.3	200	144	159
17 inches	1	25.2	225	169	185
Total contents red pine	658	450.3	35,745	16,873	26,963
Contents white pine			3,275	1,821	2,440
Total contents of acre			39,020	18,494	29,403

These contents make no allowance for defects. This showing exhibits as nearly a perfect stand as may be found.

It appears from these calculations that in the average it takes a cubic foot to make 8 board feet, or 125 cubic feet of wood to make 1,000 feet B.M. by the International rule with ⅛-inch saw kerf, i.e., 66 per cent. of the wood is recovered in useful shape, the rest being slab and saw waste. But, according to Doyle rule, the cubic foot makes only 4, according to Scribner, 6 feet B.M.

Now a systematic cruising of forties was begun, by the sample plot method, in which, by pacing, 16 equally distant stations in the forty, each 5 chains from the other, are taken and one-quarter acre carefully counted and estimated. The total count of the 16 quarter-acres on one of the poorest forties gave the following results:

Contents of 16 Quarter-Acres

Diameter.	No. of Logs.	Volume cubic ft. per log.	Total	Feet B.M. Doyle. per log.	Total.
6 inches	200	3.1	620	4	800
7 inches	219	4.3	942	9	1,971
8 inches	147	5.6	823	16	2,352
9 inches	113	7.0	791	25	2,825
10 inches	70	8.7	609	36	2,520
11 inches	41	10.6	435	49	2,009
12 inches	28	12.6	353	64	1,792
13 inches	16	14.7	235	81	1,296
14 inches	11	17.1	188	120	1,320
15 inches	6	19.6	118	121	726
16 inches	6	22.3	134	144	864
17 inches	3	25.2	76	169	507
18 inches	2	28.3	57	196	392
19 inches	1	31.5	31	225	225
20 inches	1	34.9	35	...	...
21 inches	1	38.5	38	289	289
22 inches	1	42.2	42	324	324
23 inches	1	46.2	46	361	361
	856		5,573		20,573

This forty, one of the poorest, therefore ran only 1,230 cubic feet, or only 5,090 feet B.M. to the acre. Another forty was found to run 8,800 feet.

Then, on another forty, both the sample area and the strip method were employed, which latter consists in a party travelling in a given direction and calipering and estimating logs of all the trees within a belt of ½-chain width, when, upon having travelled ¼-mile, one acre will have been measured. The results of the plot and strip method compared were (Doyle rule), 16,070 feet B.M. by the strip method, and 15,457 feet B.M. by sample plots, or 3.8 per cent. lower. This shows that the sample area method is a tolerably reliable one, and as one or two men can operate it, much cheaper than the strip method, which is worked with four men.

On May 26th the record states that the day was occupied in fighting fire, three to four miles south of Frank's Bay, giving an unscheduled opportunity to learn something of the methods of fire fighting.

Most interesting to the forester, and not yet appreciated by the lumberman, is the question of reproduction, and to this phase of the subject several days were devoted. It has already been stated that under the red pine a fine white pine reproduction had started. To ascertain its character, small sample plots of four square rods were carefully examined, with the following results:

Age, years	3	4	5	6	7	8	9	10	11	12	13	14	16	17	18	19	20	
No. of plants..	90	240	230	230	190	150	170	120	80	170	110	80	50	30	10	10	30	

There were then over 2,000 seedling trees per acre, from 3 to 20 years of age—a number which a German forester would perhaps have chosen to plant. In addition to these "seedlings" there were some young trees, 2 to 20 feet in height, and 20 to 40 years of age, scattered over the area.

On another set of 20 sample plots of one square rod in area, on a neighboring piece of ground which had been lumbered and very nearly cut clean some 25 years before and then burned over, conditions were very different, the count being per acre:

	Dominant.	Suppressed.	Total.
White pine	105	80	185
Red pine	50	29	79
Poplar	54	..	54
Birch	18	..	18
Maple	6	..	6
	233	109	342

Some of the young red and white pine specimens were cut and sectioned. They were found to be 18 to 22 years old, from 8 to 20 feet in height, with diameters of from two to less than five inches, and mostly less than half a cubic foot per tree.

The forties having all been worked up in detail, a topographic map made, the logging roads laid out, an estimate of the stand and descriptions made, the last task was to run a regular rapid reconnaissance survey of about 3,000 acres of adjoining territory, which was made by hand compass and pacing, several parties paralleling each other within one-quarter mile and then comparing and mapping notes.

By that time the black flies had taken full possession of the woods and drove the party out, or rather into other portions of the forest regions for their summer jobs.

That the students of the Forestry Department of the University of Toronto are well trained is proven by the fact that the Pennsylvania Railway Company has written to Dr. B. E. Fernow, asking him to send two graduates and a number of student assistants to assist in the work of reforestry and aforestation being carried on by the railway. About three years ago the Pennsylvania Railway decided to institute a forestry department for the purpose of making the small farms secure on the right-of-way along the line, and for the purpose of planting tie timber along the line of the railway. Mr. E. A. Sterling, of Toronto University, was made head of the department, and he has written to Dr. Fernow asking for more men. A number of the men from the University have ac-

Lumbermen's Views on Current Affairs

The Interest of the Community in the Prevention of Forest Fires—Export of Canadian Pulpwood—A Proposed Wholesaler's Association — Overweight Freight Charges

Prevention of Forest Fires

As forest fire protection is an interesting subject to all wholesale and retail dealers, as well as the lumbermen, and as at the present time the Governments of the different provinces are considering amendments to the present laws relating to the conservation of the forests, we would suggest that it might expedite and help to get better laws enacted and more public interest aroused if you would publish a series of articles on the subject. We take the liberty of enclosing an article combined from several addresses given at different places, that we feel explains one of the ways in which the public should look at the subject. If you see fit to publish it, it should help to arouse an interest in the subject and get the people thinking about it; especially if you were to add to it something calling on the people to ask their local and federal representatives to help enact better laws and ask for their being better enforced.

Yours truly,
John Fenderson & Co., Inc., Sayabec, Que.

The above letter was accompanied by the following interesting article:

Timber makes pay checks. Timber burned up pays no wages; moral: Do your best to prevent fires.

Would you set fire to any man's house in your town? If you saw his house afire would you pass by without doing anything? Do you realize that timber is quite as valuable to the owners, and much more so to the community and to you? He can build a new house but not a new forest.

The owner of the timber destroyed may suffer a loss of $3 a thousand feet if his timber is readily accessible. If that timber was marketed there would be paid for the logging and driving an average of about $5 a thousand feet. Four-fifths of this would be for lumber and supplies, which would be disbursed on the ground and a large part returned to the towns and hamlets in the immediate vicinity, from which the individual would benefit directly or indirectly.

In the further manufacture of logs into lumber an additional $2 to $3 would be spent at some point not far distant. This likewise would be spent for labor and supplies that would go toward the upbuilding of towns and cities and furnish markets for the homesteaders or farmers at some distance therefrom. Furthermore, the profits of logging and saw milling largely would be returned to the community.

In the transportation of the lumber to the markets of the world from $2 to $5 would be expended. If by water, this would operate towards the creation of a merchant marine that would render more valuable the agricultural lands tributary to our seaport towns; would create markets for farm products and aid in their wider distribution. If by rail, it would, outside of the local expenditures of the railroads for labor and supplies, invite more capital and more railroads to our province. Every increase in the transportation or manufacturing industries of the province renders more valuable every foot of land within its borders, regardless of location.

The interest of the community in every foot of standing timber in this province is fivefold greater than that of the individual owner, and it is this interest which, when once crystallized into public opinion and enacted into laws, will demand the thorough and adequate protection of our forests.

Pulpwood Exports to the U. S.

I have read your article on "The Pulpwood Situation and the United States Tariff" in the "Canada Lumberman" of February 15th, and was very much interested. I can sympathize with those Canadians who do not believe in the exportation of pulpwood to the United States. In a certain part of this State (New York) there is a large rossing mill running six or seven months in the year. The wood is shipped to a paper mill, 100 miles away. When the river is closed by ice, in the month of November, operations cease, and the men are thrown out of work. These men are then compelled to remain idle during the winter, or go to the woods. The paper mill continues running the entire year.

The approximate aggregate daily capacity of the pulp mills in the Lake Champlain and Hudson river valleys is 1,269 tons of mechanical and chemical fibres. The estimated amount of wood to supply this capacity is 1,952 cords daily.

An idea of the business done by the large paper companies in the United States can be formed from the following: The American Writing Paper Company operates 29 mills and the United Box Board & Paper Company, 23 mills. The last named concern control the American Straw Board Company, who have 15 mills, located principally in Indiana and Illinois. The International Paper Company operates 29 mills. These are located in the States of Maine, New Hampshire, Massachusetts, Vermont and New York. The daily production of the above named company is 1,700 tons of news, manillas and miscellaneous papers. The reader naturally asks, "Where does all this paper go to?"

Some time ago, a writer in one of our leading magazines estimated the amount of paper required for the daily papers of the city of New York as 135,000 tons per year. When we add to this the amount required by the book and magazine publishers, we can readily see that New York City alone uses the combined output of a great many paper mills.

The present winter's output of pulpwood in this district (within a radius of 20 miles of St. Regis Falls) will approximate 45,000 cords. The greater part of this will be rossed at the latter place by the St. Regis Paper Company, and then shipped to their mill at Deferit. During the past winter $6.50 per cord was paid for peeled poplar by the Excelsior Mills at Malone. The Malone Paper Company paid from $5 to $6 per cord for unpeeled wood. This was not received by car, but delivered by farmers in small amounts, the price varying, according to kind and quality of wood. A certain lumber firm here, had an offer of $7 per cord for unpeeled wood f.o.b. cars, or $9 per cord for rossed wood. To decide which was the better price, a cord of 4-foot wood was cut into 2-foot lengths and rossed. It was repiled and measured, and showed a shrinkage of one-third. Of course they decided to ship it with the bark on. Nearly all soft timber here is measured by the cord, whether it be for pulpwood or lumber. Wages in the pulpwood camps have been as follows: Teamsters, $35 and $40 per month; road men, $30. From $2 to $3 was paid for man and team. This included board for man and team. shortstops, otherwise known as camp-jumpers, received $13 to $26.

George B. Oberton,
North Bangor, N.Y.

The above interesting letter, bearing indirectly upon the tariff situation, gives an idea of the great extent of the paper making industry of the Eastern States. During the past year there was exported to the United States through the ports of Rouse's Point, Alburg, Fort Covington, and Malone, 277,234 cords of pulpwood from the Province of Quebec. The mills of the Lake Champlain and Hudson river valley districts, according to the figures given by our correspondent, produce annually about 400,000 tons. It is readily seen therefore, that the supplies derived from Quebec Province form a very important portion of their necessary raw material. The 400,000 tons produced by these mills would include about 320,000 tons of mechanical and 80,000 tons of sulphite pulp. The latter would need approximately 150,000 cords of pulpwood. Altogether therefore, about 480,000 tons of pulpwood would be consumed in the manufacture of the 400,000 tons of pulp. Estimating a cord roughly as equivalent to a ton, the 277,234 cords imported from Quebec would constitute about 58 per cent. of the total consumption of the district under consideration.

Should Wholesaler's Organize?

Editor "Canada Lumberman":—For some time past we have felt that the wholesalers of the province have not had sufficient opportunity for getting together to discuss trade matters generally. We would like to see something done along this line, and would suggest that you get an expression of opinion from the wholesale trade generally, as to the advisability of such meetings.

Our idea is, that an informal luncheon should be held, say once a month at some central point, such as Toronto, when matters of interest to all of us could be discussed. We know of two or three cases where money might have been saved, had there been an opportunity to compare notes.

Then there is the social side Competition is keen. "John Jones" takes two or three orders away from us and we get sore; don't like him a little bit, whereas the fact is "John" is a decent fellow, and a social mix once a month would make us bosom friends.

What do you think of the idea?

Yours very truly,
The Long Lumber Company.

The above letter should be read with interest by the wholesale lumber dealers of Ontario. The views of other wholesalers would be gladly received and published in the "Canada Lumberman."—Editor.

How Did the Overweight Charge Originate?

The J. D. Shier Lumber Company, Bracebridge, Ont., in a letter to the "Canada Lumberman" upon the matter of the weighing of cars of lumber, say:

"We notice, however, that customers are now asking for shipment to be made in box cars much more frequently than in past years, claiming that heavy rains in the summer season and snowstorms in winter very much increase the weight of the load. On a recent shipment of two cars of lumber which was apparently in the same condition, loaded on a flat and in a box car respectively, there was a difference of 500 pounds per M. feet in the weight, in favor of the latter. This, on a ten cent rate, meant a loss of 50 cents per M. feet to our customer, and could only be accounted for by the weather conditions, and not making a proper allowance when weighing."

Stumpage Dues Will Be Increased

Ontario Government Decides to Advance Dues on Old Licences to Take Effect at once

The Ontario Government has definitely decided to increase the stumpage dues upon timber limits which were issued prior to 1903. What the increase will be, had not been decided at the time of going to press, but it was learned on a reasonably certain ground that it would probably bring the dues on the old licenses up to $1.50. Licenses secured before 1892 were subject to stumpage dues of $1 per thousand feet, and licenses secured between 1892 and 1903 were subject to stumpage dues of $1.25 per thousand feet. In addition to this there are the bonus and the ground rent charges. The licenses secured since 1903 are subject to stumpage dues of $2. These will probably be left as they are, the object of the Government being to bring the payments on the old licenses closer to the new ones. The licenses all expire on April 30 of each year, and whatever changes are to be made will be decided upon before that date, so as to apply to the renewals of the licenses for the coming year.

This move has been anticipated by the lumbermen of the province for some time, but they have not been able to dissuade the Government from its proposed course A deputation of several prominent license owners recently interviewed the Minister of Lands, Forests and Mines to present their arguments against the proposed increase, but though the Minister recognized the importance of the subject to them, he was unable to agree with them that the stumpage dues should be left alone. Possibly the increases will be in the nature of a compromise, by means of which the Government will obtain a greater revenue from the timber, but which will still leave the dues on the old licenses lower than those on the licenses secured since 1903.

Whatever is done, it is certain that the owners of old licenses will be severely hit, more especially those who have recently purchased them from former owners, on the expectation that the stumpage dues would not be altered. Whatever the Government does now, it should at least give some definite assurance that the charges to be made are to be considered as definitely settled. The cost of timber in Ontario is already exceptionally high, and with any element of uncertainty the manufacturers are greatly handicapped in their operations. Those who are manufacturing lumber from limits held under the old licenses will, by the new regulations, be subjected to a greatly increased tax on their operations, amounting to from 25 cents to 50 cents a thousand feet, according to the reported intention of the Government. It will cost them exactly that much more to produce their lumber and they will be that much less able to compete against other manufacturers and especially against the cheap lumber from the United States, which comes into Canada free of duty.

Rondeau Park Policy Modified

The Ontario Government's policy of reforestation on Rondeau Park will not be abandoned, but will be proceeded with on a different basis. It will be remembered that some time ago the Government announced its intention of cutting out a lot of trees in the park, and commissioned Prof. E. J. Zavitz, dean of the Department of Forestry at the Ontario Agricultural College, to mark the trees which in his opinion ought to be removed. Tenders were then called for for the purchase of this timber.

A storm of protest at once arose from the people of the district. They maintained that far too many trees were to be cut, and that the park would be spoiled. So strong was the opposition that the Government thought it wise to drop the subject for the time being. It is now announced that some trees in the park are to be cut, but only those approved by Hon. Frank Cochrane, Minister of Lands, Forests and Mines. Only trees which have grown old and timber which is deteriorating will be cut. Mr. Cochrane has been over the ground in person, and will supervise the work.

There was considerable difficulty with the tenderers for the timber, who protested warmly against the Government's change of policy. Messrs. McKillop Bros., of Bismarck, tendered again after the change was made, and finally agreed to accept the Government's conditions. The work will not be commenced until next season, as the park will have to be gone over and the trees re-marked.

Quebec Prohibits Export of Pulpwood

Premier Gouin announced in the Quebec Legislature on April 12 the new policy of the Government as regards pulpwood. The Premier said it had been decided to prohibit the exportation of all pulpwood cut on Crown lands, before it was manufactured in Canada; secondly, to increase the stumpage dues by 60 per cent., and, thirdly, to increase the ground rent per square mile from $3 to $5. The order-in-council dealing with the matter will be issued during the present session of the House. "It is the intention of the Government," he said, "to prohibit the exportation of pulpwood cut from Crown lands before it is manufactured in the Province of Quebec, in the same way as the prohibition applies in Ontario.

Lumber News from the Maritime Provinces

The export of lumber from St. John, N.B., to transatlantic ports for the first quarter this year was twenty million feet, or about two millions less than for the like quarter last year. The British lumber market is reported in good condition.

Hon. W. C. H. Grimmer, Surveyor-General for New Brunswick, announces that the lumber cut on the Crown lands of that province will be at least 265,000,000 superficial feet, and may run as high as 280,000,000 feet, and that the reports show that the former figures were the net amount on which stumpage would be paid to the province this year. These figures are in excess of anything ever before heard of in the Crown Lands Department of this province.

Hon. F. MacLeod, Solicitor-General of New Brunswick, who recently attended the Interprovincial Conference at Ottawa, stated in an interview that he was personally opposed to the exportation of any pulp or pulpwood from the Crown lands of the province. Under a proper policy paper mills would soon spring up in the province, which would be large enough to consume all the natural product. They had many valuable water powers in New Brunswick, the value of which was only just beginning to be realized.

The annual meeting of the St. John River Log Driving Company which has formerly always taken place in Fredericton, was held this year at St. John, on April 6th. The estimates of cuts during the past winter showed that from both Canadian and American lands there will be more lumber coming down the river this year for the St. John River Log Driving Company to handle at the booms and on the drives than last year. The news from Aroostook County, in the State of Maine, is that the operations on the St. John and Allegash rivers this year are, like all the others in Aroostook, larger. The St. John Lumber Company is the largest operator and has cut 45,000,000 for use in its mill at Van Buren. The cut this year that is going down the St. John to be manufactured in St. John, follows: W. H. Cunliffe's Sons, Fort Kent, 16,000,000 feet; Albert M. Currier, Seven Islands, 7,000,000; Neal McLean, St. Francis, 2,500,000; Nazarre Pelletier, St. Francis, 2,000,000—all for Stetson, Cutler Company, of St. John; Andre Cushing Company, St. John, 20,000,000 for their own mill at St. John.

The St. John, N.B., market claims quite a number of logs cut in Maine. They are driven down the river under the provisions of the Pike law, and manufactured in St. John by American citizens and shipped back into the State free of duty. Next year, under the provisions of the new law which is to replace the Pike law, American logs cut in Maine and manufactured at St. John, will be subjected to the same duty as any Canadian lumber, and will have to pay $1.25 a thousand when shipped back into Maine. The new law will work a great hardship, it is claimed, to the American lumber manufacturing concerns of St. John, of which the Stetson, Cutler Company is the largest and best known. It is understood in Aroostook county that notwithstanding the duty the concerns are planning on continuing the cutting in Maine and manufacturing in St. John at least for one year. Under the Pike law there was for a great many years an average of over 100,000,000 feet, board measure, going from Maine to New Brunswick to be manufactured. After the Bangor & Aroostook Railroad was built the amount was decreased more than one-half, and now it will not average much more than 30,000,000 feet a season.

Fraser River Mills and Limits Sold

The Fraser River Lumber Company, whose mills at New Westminster, B.C., are the second largest in the world, have sold all their holdings to the Canadian Western Lumber Company, which recently secured incorporation papers at Ottawa. The personnel of the purchasing company will be Canadian. It is understood that at least one Toronto man, Mr. D. D. Mann, will be interested in the buying company. It is also probable that the bonds will be floated in England. Mr. McRae, who is well known in Toronto, left for the west immediately upon the completion of the transfer. It is said that the transfer involves between $17,000,000 and $20,000,000. A detailed announcement is expected in about a week, and will be published in the next issue of the "Canada Lumberman."

In connection with the reported intention of the Quebec Government to establish a Chair of Forestry, the Hon. Jules Allard, Minister of Lands and Forests, in a recent interview said that the plan of the Government was to found a Chair of Forestry in Laval University in Quebec City. The plan is not completed as yet, but it is reported that Mr. Piche will be appointed professor of forestry. Mr. Piche studied for two years at Yale and is an experienced forestry engineer. The course is to cover two years and to be free of charge. It is hoped that at least a dozen students will be secured for the first year.

Plans are being discussed for the amalgamation of all the American organizations of lumber manufacturers on the Pacific coast. The associations at present existing have a combined membership of from 350 to 400, and they represent mills with a yearly output of 1,000,000,000 feet.

THE WOODWORKER

Warping of Wood—Its Prevention

Of the several changes that take place in wood during seasoning, none is more worthy of study than the phenomenon of the warping of boards, planks, etc.

Of course, warping can be induced by agencies outside of the wood itself, such as the exposure of one side of a board to heat or moisture, irrespective of the structure or grain of the piece affected, but such warping is obviously easy of prevention.

It is otherwise with the natural warping due to the arrangement of the cells, fibres and rings of wood in the trunk of a timber tree, a brief description of which may be interesting.

If the cross-section of a log of unseasoned timber be placed in a warm, dry room for a few weeks, one of two things is pretty certain to

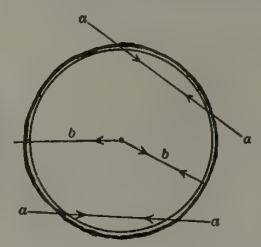

Fig. 6. Variation in Shrinkage

occur to it. Either it will be filled with a number of small shakes or checks. radiating from the heart toward the bark, as in fig. 1, or one large cleft will appear, as in fig. 2.

If the cross-section of the fresh log be sawn through the heart and the two halves left to dry, no shakes will appear, but instead, the sawn face of each piece will assume the shape shown in fig. 3.

If the log had been quartered instead of halved, as in the plan described above, each piece when dried would appear as in fig. 4. Here it will been seen that the original right angles have become acute ones.

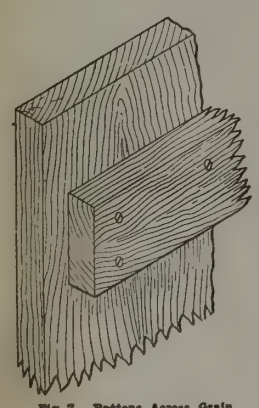

Fig. 7. Battens Across Grain

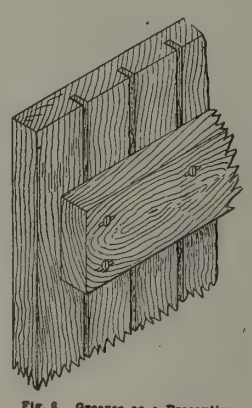

Fig. 8. Grooves as a Precaution

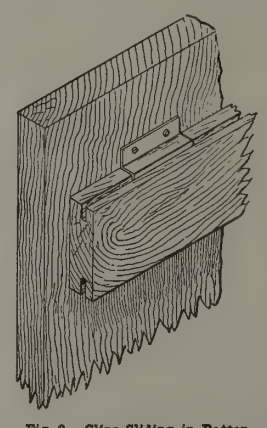

Fig. 9. Clips Sliding in Batten

Still another method might have been adopted and the section sawn into planks and dried. Then it would present the appearance of fig. 5. The centre plank containing the heart has not appreciably changed its form, but the pieces of each side of it have warped their edges away from the centre plank.

What is the reason or law for the changes of form in these various examples? They are all due to the simple fact that the shrinkage across the grain is much greater in the direction of the lines aa in fig. 6, than from the heart to the bark b. Or, to put it in scientific phraseology, the tangential shrinkage aa is from three to five times greater than the radial shrinkage b. If this fact be understood, the behavior of the various pieces already illustrated can be readily explained.

It will also be recognized that the only piece in fig. 5 which has not warped is a true radial piece, or, as a woodworker would say, is a "quartered" board. Quartering is, of course, chiefly practiced to display the silver grain or medullary rays of certain woods. But a quar-

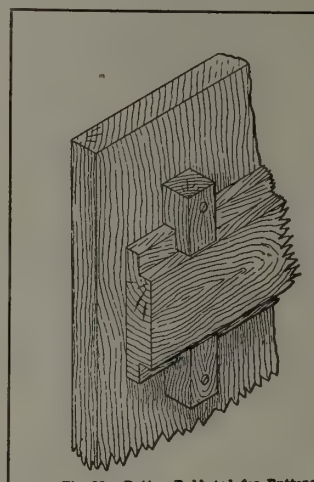

Fig. 10. Batten Rabbeted for Buttons

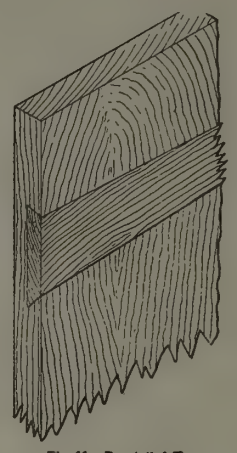

Fig. 11. Dovetailed Key

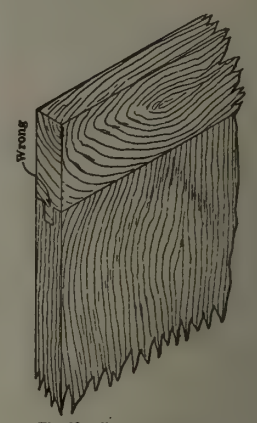

Fig. 12. Error in Tonguing

tered board is better than a "slash-cut" one, because it does not warp —at all events, not so naturally and readily as the other.

Various mechanical methods for preventing the warping of thin

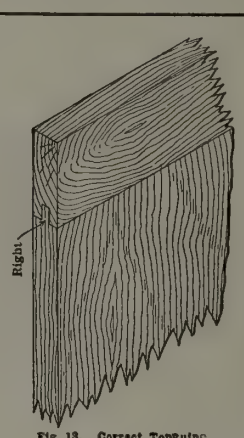

Fig. 13. Correct Tonguing

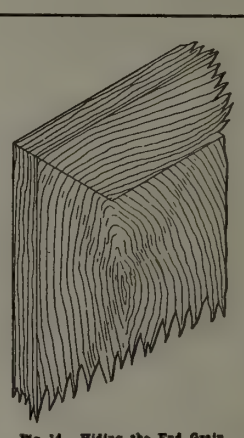

Fig. 14. Hiding the End Grain

Fig. 15. Strengthening with Iron Strip

boards are in use by woodworkers. The commonest is that shown in fig. 7, where a plain ledge or batten is nailed or screwed across the grain of the piece which is to be kept true. For broad pieces, such as draft-

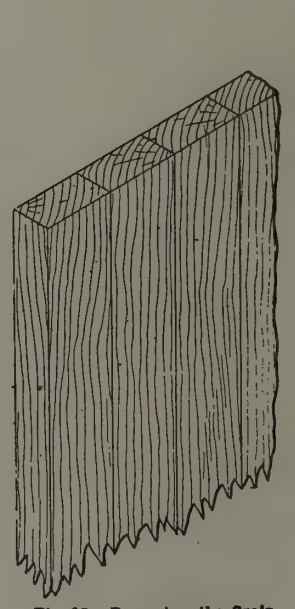

Fig. 16. Reversing the Grain

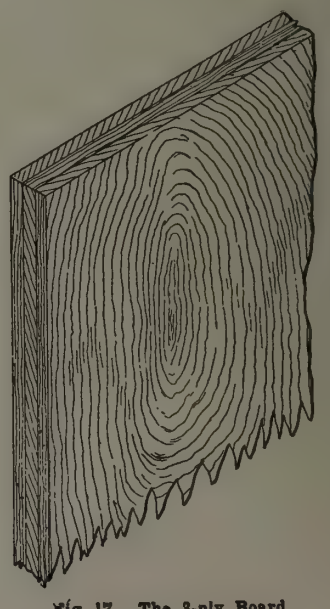

Fig. 17 The 3-ply Board

ing boards, the screw holes in such battens should be slotted to allow of the expansion or contraction of the board as it is influenced by the changes of moisture in the atmosphere.

As an additional precaution another device is often used in conjunc-

tion with the battens or drafting boards, and is shown in fig. 8, where grooves have been made in the under side every two inches or so.

Fig. 9 shows another useful method for drafting-board: Small metal clips being inserted in grooves in the batten and screwed to the back of the board in lieu of screws through the battens. A variation of this is sometimes seen on large drafting-table tops, the batten being rabbeted for wooden buttons as in fig. 10.

A dovetailed key, fig. 11, finds favor with many, and if well fitted is an effective method.

Flush clamps across the end grain are used in a variety of situations and are attached by a groove and tongue joint. A common mistake is to form the tongue on the clamp, as in fig. 12, instead of on the end grain of the board, as in fig. 13.

In first class work flush clamps are often mitered, fig. 14, so as to show no end grain. This is necessary when the edge has to be rounded or modelled, as in tables and desk tops.

For common work, a rough but effective method is to plow a groove across the end grain and insert a strip if iron as in fig. 15.

Where neither battens on the back nor flush clamps are desirable a very good plan is to glue up narrow strips, fig. 16, the grain being reversed in alternate strips as indicated in the illustration.

Any consideration of the methods of preventing warping would not be complete without a reference to the now familiar three-ply boards, which are used for such a variety of purposes to-day. Usually of three thicknesses of stout knife-cut (peeled) veneer, glued together with the inside piece across the grains of the outer ones, fig. 17, it forms perhaps the most effective method at our command to-day for holding wide boards true and straight.—T. B. Kidner, in "Wood Craft."

When to Install New Machinery

Suggestions for Those Who Contemplate Replacing Old Equipment by Modern Devices

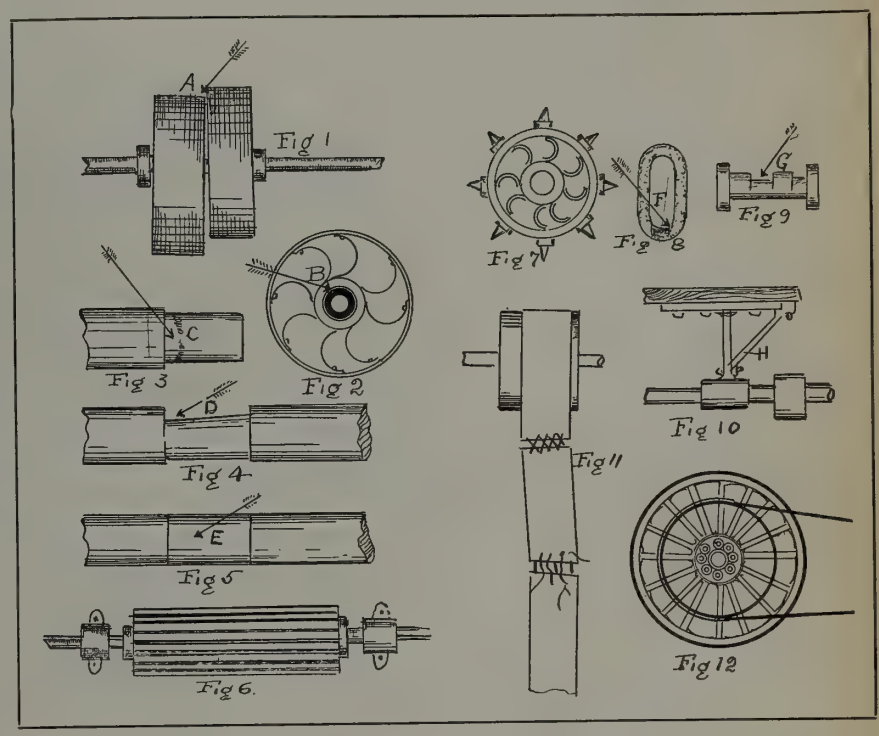
This is an age of new and improved machinery. The railroads are constantly abandoning locomotives and cars which are only partly worn, for the purpose of installing more up-to-date rolling stock. The publishers of the big newspapers are forever remodelling their plants with the latest patterns of speedy printing presses to replace presses which are still in excellent running order, but are not up to the times. And so it is in the metal working shops and the woodworking establishments. The flour mill and the stone works are all in line for modern machinery at the sacrifice, so to speak, of old and only partly worn machinery.

The writer has given this matter of new machinery for woodworking establishments some attention of late. He found that practically all of the enterprising woodworking mills were being refitted with various new types of machinery as a regular thing. At nearly all plants, one will observe a number of new machines in crates or in process of being set up to take the place of some machine which seemed to be in good running condition, but which was not of the latest pattern.

The era of new machinery for old is not restricted to boilers, engines, waterwheels, planers, band saws and other machinery of the mill, but includes the small tools. The new tool era is also in vogue. Second-hand dealers in woodworking machinery and tools are doing a flourishing business in buying up partly worn machines and tools for sale in the country mills. The latest and most approved designs of saws are constantly in request in the modern shops, whereas you will find specimens of discarded saws of an off-pattern thrown aside, though still in fair working condition.

Some would say that money is lost because of the throwing aside of some partly used gimlets to make room for the better patterns. The perfected mitre scales are required to replace scales which are still serviceable, but which are not quite up to the times. Bit braces on which some minor fixture has been improved are demanded because of a little time gained or a little better work done by the new brace. Chisels of all kinds must be quite accurate to meet the needs of the modern woodworker. Unless the plane possesses several economical features and is capable of doing fine work, it is abandoned to make space for a better grade. It is simply the woodworker's fad. Special taper files and other modern tools are the only kind supposed to be serviceable in the improved city shop. The older kinds of tools may still be in use in the small towns and remote plants.

We find the same ideas prevailing also with respect to the machinery of the modern plant. You can speak with any of the interested parties on the subject with the same results. All argue the advantage of having new machinery and tools and the disadvantage of old machinery and tools. A superintendent has a good excuse for making little profit on the work when he is handicapped with old apparatus. And he uses that excuse every time the owner has anything to remark concerning the profits and losses of the shop.



Sometimes new machinery is put in and still the results are poor, due to defective driving gearing. I saw a good, up-to-date mortiser running badly in a shop because the driving wheels of the overhead shaft were in the shape shown at fig. 1. As soon as the driving wheels were fixed level, the mortiser ran steadily and with good speed.

The worn wheel had to be turned out in the hub and a bushing put in as at B, fig. 2.

A party let a gasoline engine shafting get too hot and run dry in a mill. It was an up-to-date engine, but was running badly, due to the worn places, C, on the shafting, fig. 3. It was not an old engine. The outfit was not ready for the junk heap. We have to distinguish between worn out devices and devices in which some particular part may be worn, as in this instance. In this case, the remedy consisted in replacing the worn shaft with a new one.

In another case the shaft was worn, as at D, fig. 4. This was fixed by shrinking on a sleeve, E, fig. 5. In a self-feed rip saw, the feed roll was giving trouble and one man claimed that the machine was out of date. Not so. The feed roll which made the trouble was in bearings adjusted as in fig. 6. The bearings were slightly worn. The caps were a little too loose. The oil holes were plugged with gummy matter. All that wa necessary in this case was to have the bearings washed out, the caps reset, the parts cleaned and then the machine ran satisfactorily so far as the feed rolls were concerned.

In another rip saw a spur wheel of the pattern in fig. 7 gave trouble, due to the wearing of the points of the spurs. But this did not condemn the machine. New spurs were put in, and then the chain driving gear-

ing bothered and the party in charge wanted to give it up. The chain links were found to be worn at the bearing ends, as at F, fig. 8. The pins were worn, as at G, fig. 9. A new driving chain brought the mechanism up to date and no further trouble ensued at this point.

Sometimes a glance at the belting of the sawmill or carpenter shop will reveal the condition of things. I saw some woodworking plants in which the belting was in the order shown in fig. 11. This illustrated the average order of the driving machinery and the apparatus in general. In this plan there was a hanger in use, like that in fig. 10, with a single centre support. In order to brace this hanger, the bar, H, was bolted at each end. When you see braces bolted on like this you can determine the nature of the driving mechanism of the shop. I was greatly astonished to see a common wagon wheel used as a balance wheel on a certain woodworking machine in a plant, as in fig. 12. It seems that the machine lacked a steady motion, due to defective driving of the main power mechanism. But the boss thought differently. Therefore he happened to get his hands on an old wagon wheel, and this he had bolted to the belt wheel of the machine. This fly-wheel did not help steady the machine at all. But the boss said it did, and that had to go.

All such devices are money losers to the owners of the plant. New and improved machinery, tools, and devices for the woodworking plant are suggested. These are the remedies for all patchwork of bosses, mechanics, carpenters, and tinkerers.—George Melrose, in the "Woodworkers' Review."

Arrangements have been completed for the annual meeting of the National Lumber Manufacturers' Association, at New Orleans, Louisiana, from April 19 to 21. An interesting programme of reports and addresses has been arranged, and a number of attractive entertainment features have been designed. A large attendance is assured.

General Improvement in Lumber Trade

Reports from many Sources Tell of Splendid Prospects for 1910 Trade—Retailers in the West will Need Large Supplies—Canadian Spruce in England

W. A. Anstie, secretary of the Mountain Lumbermen's Association, who returned recently from a business trip to Winnipeg, Calgary and other points east of the Rockies, in an interview said:

"The outlook for business is excellent. The retail men throughout the prairie province have had a winter better than usual for business, on account of the comparatively open season this year, and I anticipate a good spring demand as there is every indication of a large immigration. The railway extensions under way will open up a large territory tributary to the mills of British Columbia. At the present time stocks are very low and the season will open with a large amount of business ordered ahead. From present reports business will be very satisfactory. Present indications are that the cut this year will be from 50 to 75 per cent larger than last year. We are well on the way now to satisfactory conditions. If seeding conditions are good on the prairie, the whole of the lumber mills will be running full blast. This, in turn, will have an immense effect on commercial conditions generally in this part of the country. The feeling on the prairies is good everywhere. Prosperity is in the air. Winnipeg, Calgary and Lethbridge, in particular, are looking for a great deal of building. In Calgary a competent authority told me the building this year would be equal to that of the two previous years."

A United States View of Canadian Trade

A United States view of the outlook for the Canadian lumber trade is given in a recent article in the Seattle "Post-Intelligencer," which deals with the subject as follows: "The general forward movement which marked Canadian trade last year was not missed by the lumber exporters, for they also profited by the trade improvement in the United States and England. For the current year the general outlook for the Canadian lumbermen promises great activity and expansion in the lumbering industry of the whole Dominion.

"From all accounts, stocks of lumber throughout the country have diminished very considerably, and the fear is expressed in some quarters that the supply of dry lumber for use during the building season of 1910 will be inadequate. In view of such a condition, reports from British Columbia say that lumber companies generally are placing as many men in the woods as they can possibly handle. A feature stimulating the industry is the demand for ties. For a supply of these the larger Canadian railways are directing their attention to the timber resources of the western provinces. In northern Manitoba and Saskatchewan more than 3,000 men are employed in getting out ties and logs. One company alone has 1,500 men at this work.

"In the Ottawa valley the independent attitude of the lumber manufacturers in respect to prices for the cut of 1910 is giving concern to middlemen who are looking around for supplies for the coming season. It does not appear that many large contracts have yet been closed for the output of the Ottawa river mills for the approaching summer. Mill owners are holding on to stock more firmly than at any other time since 1906. Buyers from the United States at this time last season were able to get slight reductions on upper grades, as compared with the season previous, but now the reverse is the case. There is an all-round advance of $5 per thousand on nearly everything better than shipping culls."

Good Demand for Canadian Spruce in England

The "Timber Trades Journal," London, Eng., dealing with market conditions, says: "There is every indication that the market for spruce deal goods is stronger both as regards c.i.f. and spot values. Parcels recently to hand have been sold at 2s. 6d. to 5s. per standard more, and we hear that shippers will not accept any reduction for the few parcels now on the way. We notice particularly that what parcels are arriving at West Coast ports are only of very moderate proportions, very few reach the 200 standards mark, and, from what we can gather, are being keenly competed for by the importers. We should not be at all surprised to hear that these shipments by liners tail off considerably during the remainder of what is termed the liner season. If this should be the case, and as stocks are by no means heavy, we venture to suggest that prices will be likely to advance still further. We have not heard of any contracts having been made for cargoes for early shipment, although we have heard that shippers' ideas are above those values which are ruling to-day.

"Judging from the demand which still exists for maple flooring, we are still some way from the end of the skating rink boom. It would, perhaps, be hardly correct to say that of the making of new rinks there is no end; but even at the tail end of the winter season bold speculators are to be found preparing for a return of the craze next winter. Just now some of the large producers are so full up with orders that they are unwilling to take further business. Shippers have taken advantage of the situation to again put their prices up, and for the favorite roller rink widths (1x2½ and 2¾ inches) shippers are now asking round about £20 5s. per standard c.i.f. Liverpool or Manchester, with the usual extras for London, Hull, Glasgow, and similarly placed ports. For 1x3¾-inch a reduction can usually be obtained of about 25s., or 30s. per standard.

New York Taking Plenty of Spruce

J. L. Christy and J. Douglas Moir, wholesale dealers in Canadian spruce on the New York market, recently made a two weeks' trip through the Province of Quebec, where they obtained over 50,000,000 feet of spruce for their 1910 trade. In discussing the matter, Mr. Moir was most enthusiastic, and stated that in all his experience in the lumber business he could not remember having made so successful a trip. In addition to acquiring the stocks and entire output of those mills from which they have been able to ship during the past two years, they made arrangements by which they are to act as sole sales agents for the Iberville Lumber Company, of New York, whose large new mill at Sault-au-Mouton, on the Lower St. Lawrence, has a capacity of from 10,000,000 to 12,000,000, and for Messrs. G. A. Grier & Sons, Limited, of Montreal. In addition to having made these purchases and contracts, Christy, Moir Company sold for export to the European trade at satisfactory prices, a block of six and a half million feet of the spruce output of the Iberville Lumber Company's mill. They reported the lumber trade in Montreal to be very active for this time of the year. In nearly every case mill owners and dealers were preparing for and confidently expecting a prosperous period of business.

Brisk English Market for Waney Pine

Messrs. Denny, Mott & Dickson, Limited, London, Eng., report under recent date as follows: Canadian timber—The chief feature in this market has been the brisk demand for waney pine, and as the stocks on this side have been practically cleared out, forward contracts for next season's supply have been sufficiently important to already dispose of the bulk of the looked-for supply for shipment all this year. Unprecedented prices have been paid, and it seems that consumers who have not already covered forward will have to fall back on any second-class timber that may be available in Quebec, now that the first-class timber is exhausted. Elm has been selling at hardening prices, and the shippers have been obtaining an appreciable advance on contract rates for next season's supplies of this wood, as compared with those of last season. Oak has remained stagnant, both for demand from stock and in respect to forward supplies. Spruce—This market has been quiet and without any fresh feature. F.o.b. prices are perhaps not quite so firm as they were at the opening of the year.

Poles and Posts Moving Actively

There is a good demand for telegraph poles in Ontario, because of the recent destruction of a number of poles by storms, and because of increased railway building. Wholesale prices of ties and poles at Ottawa are as follows:

Ties—Standard railway ties, 6-inch	$0.45 to $0.50
Mill run cedar ties	0.38 to 0.45
No. 2 railway ties	0.25 to 0.30
Telegraph poles, 25 feet long, 6-inch to 8-inch top	$1.25 to $1.75
" 30 feet long, 6-inch to 8-inch top	1.75 to 3.00
" 35 feet long, 6-inch to 8-inch top	2.50 to 4.00
" 40 feet long, 7-inch top	4.25 to 4.75
" 45 feet long, 7-inch top	5.25 to 6.25
" 50 feet long, 7-inch top	8.50 to 10.50
" 55 feet long, 7-inch top	11.00 to 13.50
" 60 feet long, 7-inch top	16.50 to

Wholesale prices at Parry Sound are as follows:

Telegraph poles, 25 feet long, 6-inch top	90c. to $1.00
" 30 feet long, 6-inch top	1.25
" 35 feet long, 7-inch top	1.75
" 40 feet long, 7-inch top	2.50
" 45 feet long, 7-inch top	3.00
" 50 feet long, 7-inch top	3.50

Prices for telegraph and telephone poles are quoted as follows, f.o.b. shipping points, in Quebec.

Telegraph poles, 30 feet poles, 6-inch top	$2.25 to $2.50
" 35 feet poles, 7-inch top	2.40 to 2.70
" 40 feet poles, 7-inch top	3.25 to 3.50
" 45 feet poles, 7-inch top	4.50 to 4.75
" 50 feet poles, 7-inch top	5.75 to 6.00

Since the removal of the surtax on goods between Canada and Germany, Montreal pulp and paper men are receiving inquiries for wood pulp and box boards. Under the new tariff arrangements these can go into Germany at very favorable terms, and there is no doubt that a considerable amount of business will be worked up along these lines.

Machinery and Equipment

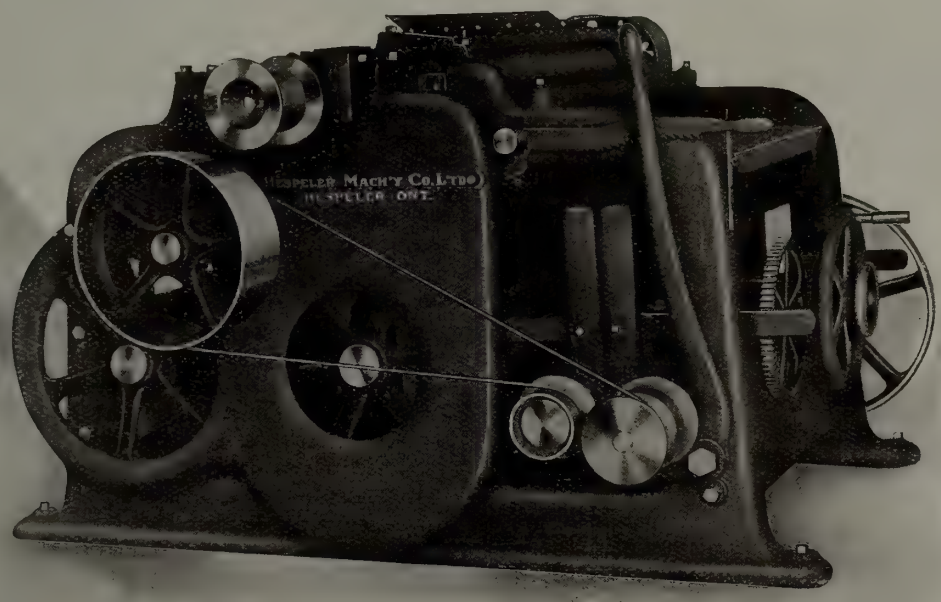
What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Lidgerwood Skidders for Fraser River Company

The Fraser River Lumber Company, of New Westminster, B.C., have just placed an order for two Lidgerwood "skidders," popularly known as "Flying Machines." This is the machine that is attracting so much attention among the Washington loggers, a number of them having been recently installed in that State.

From the success they are having, the indication is that the "skidder" will shortly replace the "donkeys" now so generally in use on the coast. This "skidder" clears 40 acres at a setting, yarding and loading the logs through the air, so that no sniping or swamping is necessary, and the logs are delivered free of grit. While the regular crew is only 14 men, as with a yarding donkey, the daily capacity is from 60,000 to 100,000 feet.

The Fraser River Lumber Company's machines will be the largest ever built, in order to suitably handle their timber, and some idea of the great size of these machines may be gained from their weight, which is approximately 90,000 pounds each. The new logging camp to be opened by the Fraser River Lumber Company will be the largest in British Columbia, with a daily capacity of 400,000 feet. Mr. A. D. McRae is general manager of this operation, which also has the largest sawmill in British Columbia.



An Improved Cabinet Planer

The Hespeler Machinery Company, Limited, of Hespeler, Ont., produce an excellent improved cabinet planer, of which an illustration is given herewith. It will be noticed that the general design of the machine is symmetrical and finished in appearance. The feed consists of four rolls 5-inch in diameter, driven with gears cut from the solid. The cylinder is made from the best grade of steel and runs in bearings 2 15/16 of an inch in diameter by 10 inches long. These bearings can be adjusted in a few seconds, so that the wear will be taken up evenly for the entire length. The table is of unusual length, 56 inches long, is made in three pieces and is raised or lowered on long wedges on each side. It is adjustable by means of a hand wheel, which is clearly shown in the illustration, geared up in such a manner that a child could raise or lower it. It is locked in position by a small hand wheel, which is shown on the outside of the larger one.

This machine will take any material from ⅛-inch to 7 inches in thickness, and deliver it clear of the machine. The chip breaker and pressure bar are of the latest type, working on a circle and admitting of the finest and easiest adjustment

It will be noticed that the weights are on the inside of the machine, so situated as to be easily removed and entirely out of the operator's way. The gears are of ample proportion, and are all cut from the solid. The machine is built in three sizes, viz.: 48-inch, 36-inch and 30-inch, the approximate weights of which are respectively: 7,500 pounds, 6,300 pounds, and 5,400 pounds. The 36-inch machines are kept in stock at all times, or are under construction, and intending purchasers can examine them thoroughly before buying.

The 48-inch machine occupies a floor space of 7 feet 6 inches square; the 36-inch a space of 6 feet 6 inches by 7 feet 6 inches, and the 30-inch machine a space of 6 feet by 7 feet 6 inches. These machines have all tight and loose pulleys, 12-inch x 8½-inch face, and should run 750 r.p.m. The company guarantee every machine to do its work in a satisfactory manner. Those who desire further information will do well to communicate with the company, mentioning at the same time the "Canada Lumberman."

Hespeler Machinery Coy's Improved Heavy Cabinet Planer

Saw Complaints—An Instructive Discussion

Speaking of complaints—a man called at the Disston Saw Works some time ago, carrying a Disston handsaw. He seemed very much aggrieved and complained bitterly about their sending out such a saw as the one he had.

"Why," he said, "it will not cut wood; in fact, it will not cut anything."

This struck the Disston folks as being rather curious, for in their 70 years of saw making, some millions of saws have been made and sold by them. Upon examining the saw, however, the cause of the difficluty was readily apparent. The Disston representative casually asked the visitor if he thought the saw would cut iron. "No. of course it won't," said the visitor emphatically.

Asked if he could wait a few minutes, he said he could. Disston's man took the saw out in the shop, had it specially filed to cut iron—(notice the specially filed part)—brought the same saw back, took the visitor to the machine shop, got a piece of iron bar about two inches in diameter, placed it in a vise, tightened it up, put the saw to work, and in short order neatly sawed the bar in two without any trouble whatever, and the teeth were still in fair condition.

The visitor was utterly amazed. "Well," said he, "I wouldn't have believed it."

After an explanation of the trouble—simply a matter of the condition of the teeth in the saw—he asked: "Can you put it in proper condition for sawing wood?"

"Yes."

"Well, do it, and I will never complain about a Disston saw again."

The majority of users do not know or give little thought to the fact

that to obtain the best results in any particular class of work the saw must be specially toothed and filed for the sawing to be done.

Years of experimentng have determined just what shape or space, angle and bevel should be given to the teeth, as well as the amount of set best suited for this or that class of sawing; that the tooth best adapted for sawing soft woods is not at all suitable for cutting hard woods. Of course, the work could be done after a fashion, but the result would not be as good as that obtained by the use of a saw properly toothed for its particular purpose. You can take a rip saw and crosscut with it, but note the difficulty.

In line with this, it may be noted that even a saw blade made for cutting soft metals is not at all adapted for sawing the harder metals, nor will a saw made for sawing wood stand the work of cutting a combination of wood and metal without injury to the points of the teeth thereby spoiling it for further use in making a clean, sweet cut in wood. A saw that it "fitted-up" for sawing wood has the teeth filed with a bevel back and front, given a proper set, enabling it to do fast cutting. A handsaw for sawing metal has no set on the teeth, but is ground for clearance and filed straight across the front of the tooth, while to a limited extent it would cut wood, but not in a manner that a mechanic desires In other words, it is not adapted for wood cutting and its temper also is different from that of a wood cutting saw.

It is for these very reasons that various patterns of saws are made and specially toothed for the different kinds of work. Experience in this line is the best teacher. Take a saw fitted up for sawing wood, try it on a piece of metal. No matter what kind of a saw it may be, or whose make, it positively will not do as good work afterwards in sawing wood without being re-fitted.

The Michigan Sprocket Chain Company, Detroit, have furnished the "Canada Lumberman" with a copy of their general catalogue No. 6. The The catalogue is substantially bound and attractively published on calendared paper, which shows up the numerous illustrations with great distinctness. The company manufacture a wide range of detachable sprocket chains, riveted drive, pintle and carrier chains, log-haul-ups, sprocket wheels, clutches, take-ups, etc. Lumber manufacturers will be interested particularly in the company's log haul-up, which is clearly illustrated and described.

Lumber Matters in Law Courts

Interesting Descision Regarding Meaning of "Mill Run"—Shanty Men Lose Wages after Leaving Camp

Interpretation of "Mill Run"—The Divisional Court of Ontario has upheld the judgment of Latchford, J., in the case of Wood v. Gall Lumber Company. The defendants had purchased from the plaintiff certain logs to be cut into lumber and paid for at stated price per M. feet. Defendants put forward many grounds as absolving them from performance of contract. Latchford, J., held that defendants had failed to give shipping orders simply because they could not make sales and that the plaintiffs were thereore justified in selling the lumber at a loss and that the defendants were liable for said loss, $2,577.59, with interest and costs. Judge Riddell in delivering judgment, said: "The case is wholly one of fact, and depends on the interpretation to be given to the expression "mill run." Had it not been for the letter that has been frequently referred to we should, perhaps, have found that the parties had not agreed in the use of the expression; and it might them have become a question as to how far a contract had been actually entered into. It seems plain, from the evidence, that the expression "mill run" is used sometimes, at least, as including the whole run of the mill in merchantable lumber, including 'mill culls.' It seems plain that the plaintiffs used the expression; in this sense, and the letter referred to, taken in connection with other circumstances, makes it plain that defendants also had the same view of its meaning. A contract was therefore made whereby defendants undertook to purchase the lumber by 'mill run,' including therein 'mill culls.' They refused to accept this lumber; and it cannot be successfully contended that plaintiffs acted in an unreasonable way in disposing of the lumber as and when they did. The conclusions arrived at by the learned trial judge are right; and the judgment should be affirmed with costs."

Responsibility for Payment—Judgment was rendered in the Quebec Superior Court recently in the case of Oscar Villandre, of Danville, against Joseph Villeneuve, of St. Roumauld, by Mr. Justice Hutchinson. This was an action for the sum of $1,524.32, being the balance of an account amounting to $8,493.04 for pulpwood sold to defendant in the year 1907. The defendant contended that the wood he purchased was not for his own benefit, but for the benefit of the Joseph Villeneuve Company, of which he was the manager. The court held that when the transaction took place the Joseph Villeneuve Company had not been formed, and that the contention of the plaintiff that the defendant did not inform him that he was only purchasing the wood on behalf of any company was established. The declaration of the plaintiff that he had made out drafts as payment for a portion of the wood, in the personal name of Joseph Villeneuve, was also proven, and no objection had been made to this by the defendant. The court found for the plaintiff and ordered the defendant to pay to him the sum sued for, with interest and costs of suit.

Loss of Logs During Towing—In the case of the Barnett-McDonald Lumber Company v. the Union Steamship Company, recently heard in a trial court in British Columbia, the action of the plaintiff was for negligence in towing a boom of logs, whereby the defendant lost 342 cedar logs belonging to the plaintiff. Judge Gregory found the defendant guilty of negligence and gave judgment for the plaintiff with costs for the 342 logs, and stated that the defendant's captain, Daniel Donald, had started with an improper fastening boom and without calling attention to the defects.

Payment for Sawing—Mr. Thomas Hodgson, of Orillia, Ont., was awarded $2,144.49 against the Wood Products Company, of Toronto, by Mr. J. A. C. Cameron, official referee, recently. Mr. Hodgson's claim was for wood cut for the company. The sum of $2,100 had already been paid by the latter, but Mr. Cameron found that plaintiff was entitled to $4,244.49 altogether.

Shantymen Lose Case—At Maniwaki, recently, Judge Goyette dismissed the case in which a number of employees entered an action against the East Templeton Lumber Company. The men left the company, it is alleged, on account of the poor board, and were suing for wages. The defendants entered a plea that the men had deserted.

Injury to an Employee—Rhine Fakkema has been awarded $4,500 damages in addition to all doctor bills, costs, etc., from the Brooks, Scanlon & O'Brien Lumber Company, Victoria, B.C. The plaintiff received injuries while working in one of the defendant company's logging camps.

Improvement Expected in Cooperage Trade

The Sutherland-Innes Company, Chatham, Ont., report as follows under recent date:

"The reports which we have received from our own mills and outside mills, give the stock as very light, partly on account of timber getting more scarce all the time, and partly on account of the unsatisfactory prices for cooperage stock. Quite a number of the mills formerly manufacturing cooperage stock are putting their elm into lumber and veneer this season, as elm lumber is a better proposition than cooperage stock.

"The same applies to birch lumber and birch veneer bringing higher prices proportionately than if the logs were put into staves. Very little hardwood has been taken out for staves this season, and a fairly careful compilation of the anticipated outputs in the north would show a very serious diminution in the output as compared with last year.

"The weather in the south for lumbering has been very unfavorable, and there has not been much done in the way of manufacturing up to the present time. From present indications, the output in the south, however, will be almost on a par with 1909, as while some of the mills have gone out of commission, others have started up, and while the spring cut will be light, if the market warrants it, the summer and fall cut can be increased considerably.

"A great many of the large consumers have now placed their contracts for the year at about the same prices as a year ago, in some lines a little higher, but the average will be about the same as last year. Most concerns have contracted for more stock than a year ago, as they look for very much better business this year.

"The carload trade for the past two months has been very good, and dry staves are bringing from 25 to 50 cents per 1,000 higher than during the latter part of 1909.

"Apple barrel stock is being offered at very low prices for promot shipment, but the manufacturers are asking a considerable advance for later shipment.

"Hoops are stiffening somewhat, but there is very little change in the price of heading.

"Both the manufacturers and coopers are of the opinion that the consumption of stock this year will be very much in excess of last year, and if this is correct, we may look for better prices, as these have been very unsatisfactory to the manufacturers for some time, curtailing the output, turning logs into lumber or veneer as against cooperage stock.

"The wet weather in the south has had quite an effect on the production of tight cooperage, and prices have advanced considerably all along the line. The demand for white oak staves, especially, has been very brisk during the last two months, some lines being entirely cleaned out, with quite a strong demand, which the manufacturers are unable to fill. The bad roads have prevented the stave makers from getting their goods to the railroad, and until there is better weather very few staves will be taken out; we, therefore, look for very much better prices in white oak staves than we have had for some time."

The British America Mills & Timber Company, Limited, have moved their head office at Winnipeg, Man., into new offices on the sixth floor of the Somerset Building.

Lumbermen

Who are critical in their demands always find in our method of selling direct to the regular trade, the close attention to the minutest details so absolutely impossible to secure when buying haphazardly.

To provide for filling all our orders promptly and satisfactorily, we have large and well assorted stocks on hand constantly—a feature that can hardly help pleasing you.

We want to prove to you that we are different from the others in many ways.

A Trial Will Convince You

So-Called French Walnut

The finest and most costly of the veneer woods is French walnut —a wood that does not come from France, but from Persia and Asia Minor. The tree is crooked and dwarfed, and is solely valuable for the burls that can be obtained from it. These are large, tough excrescences growing upon the trunk. In these the grain is twisted into the most singular and complicated figures. The intricacy of these figures, combined with their symmetry, is one of the elements that determine the values of the burl. Color and soundness are other elements of value, which varies very widely. Burls worth from $500 to $1,000 each are not rare, and in Paris some time ago one burl weighing 2,200 pounds was sold for $5,000, or upwards of $2 a pound. In buying burls much care is necessary to guard against fraud. Often decay or malformation results in leaving hollows in the very centre, which, of course, greatly lessens the value. These hollow places are sometimes filled by fraudulent dealers with substances resembling the wood, and the whole is sold at a very much higher price than it is worth. Compressed manure is one of the materials used for this purpose. An even worse fraud than this is that of placing stones in the hollows to increase the weight and thereby enhance the value of the burl. This not only cheats the buyer, but is liable to ruin the valuable knives used in cutting the veneers. There are rosewood, circassian, and mahogany burls, but unlike those of the French walnut, they are but of little or no value. In those woods it is the trunk of the tree that is prized; the knots are discarded.

Pencil Wood Wanted

With a view to replenishing the supply of woods adaptable to the manufacture of lead pencils, the Forest Service of the United States has perfected plans for testing a number of the national forest woods in co-operation with several leading representatives of the pencil industry.

It is stated that the supply of red cedar, which furnishes practically all the wood for the annual output of 325,000,000 pencils, will be exhausted within five years. In view of this situation, a substitute must be found which has all the necessary qualities of pencil wood, and which grows in sufficient quantities to meet the manufacturers' demand.

Among the woods in the national forests to be experimented with are Rocky Mountain red cedar, alligator juniper, western juniper, redwood, incense cedar, western cedar, Port Oxford cedar and Alaska cypress. The specimens collected will be sent to four different manufacturers who have agreed to test them.

The Forest Service is assisting in this experiment, because there are in the national forest large quantities of juniper and cedars which may be suitable for pencil manufacture.

What Timber Did for the Railroads

Before the State of Washington had direct rail conections with the East, one could give cedar logs away. They used to let them run out into the sea to get rid of them. Because low rates gave value to them, the price has gone up to the present figure. These rates added later billions of dollars to the north Pacific States. Resources were developing the people of the interior, as it had a more abundant supply of better lumber at low price than ever before, and there was an unprecedented growth of popularity and prosperity upon the Pacific.

When the railroads undertook the task of building up a trade between the United States and the east coast of Asia it was absolutely necessary for them to have a favorable transportation rate. How this was made possible by the Pacific coast lumber industry is told by James J. Hill in an article in the January number of the "World's Work."

The lumber business of the Pacific coast made possible the naming of a rate that should open to us the closed doors of the Trans-Pacific East. There were 400,000,000,000 feet of standing timber on the Pacific coast. It could not pay the 90-cent freight rate to the East at that time, when lumber prices were but a fraction of what they are now. The railroads could not afford to haul empty cars west to carry that lumber east. It costs, roughly, $160 to haul a car $2,000 miles across the continent. But they could afford to carry lumber temporarily at a low rate rather than bring cars back empty. And if in this way the lumber business could be developed, it, in turn, would make possible later a low west bound rate, on which trade with the Orient could be built up.

An Opening For Canadian Goods

English Market For Small Wood Goods Might Be Developed—Some Details of the Trade

W. A. MacKinnon, Canadian Trade Commissioner at Birmingham, Eng., in a recent report to the Department of Trade and Commerce, says: "It is often said that the day of small things is over. But it is certainly not true if the small things are handled in a large way. Attention has recently been directed to the important trade now carried on, and the still greater possibilities awaiting development, in connection with sundry small items of wood goods. A firm of selling agents, who have a large business in the Midlands and other parts of Enlgand, supply the following examples of their individual sales of certain articles, as giving some idea of the vast total trade in these lines:

Wooden Box....2½ inches high by 1⅛ inches diameter.....	20,000 gross
Wooden Box....1 inch high by 1½ inches diameter	20 to 75,000 gross
Wooden Box....1¼ inches high by 1¾ inches diameter	5,000 gross.
Wooden Box....2 11/16 inches high by 9/16 inches diameter..	15,000 gross.
Wooden Box....2⅛ inches high by ⅞ inch diameter.....	5,000 gross.
Curt'n pole ring.2¼ inches inside diameter.....	20 to 30,000 gross.
*Spindle.....2 9/16 inches long by 13/16-inch over all.....	1,000 gross.
Wooden Spool...11/16-in. long by 11/16-in. dia. (bored through)	10,000 gross.
Wood Turning..1 inch diameter with projection.....	50,000 gross.

*Also used in similar quantities 2 inches long between shoulders with same tenons.

"Canadian exporters must be prepared to meet the competition of the United States and Sweden. The former produce the right class of goods, but have caused great dissatisfaction by delayed and insufficient deliveries. Herein, it is confidently asserted, lies Canada's opportunity; if she will make a serious bid for this trade, taking 'prompt deliveries' as her cardinal principle, there is the certainty of a tremendous and satisfactory business. Sweden, on the other hand, gives less cause for complaint as regards deliveries, but Swedish goods are stated to be inferior in finish and in careful selection to those from the United States In this matter also Canadian firms should be able to learn from the failure of others, and turn out first class goods from the start.

"It must be understood, however, that no such profit can be charged on these small goods as might be appropriate in the case of elaborate manufactured articles. It is assured that 10 per cent. net profit should be the highest aimed at, and that while it would be unsafe to attempt more, the turnover should, if the articles are manufactured economically, be sufficient to make that rate highly remunerative to the manufacturers.

"According to the best information obtainable, the chief difficulty lies in the fact that each of these small articles may require an expensive machine, and that no mill is likely to install the requisite plant for turning out so many articles. As mentioned above, it has been found that United States deliveries are irregular, even in the case of one important firm which has nine separate factories to draw upon.

"The inference is that no single mill has a chance of successfully securing and maintaining a place in this market. The natural solution suggested is that there should be a combination of factories for the purpose of this export trade, each to install one special machine only, and make one line of goods on a large scale. It is pointed out and emphasized in this connection, casual sales, even of very large quantities, are of no use, and lead to nothing. Success is promised only if a serious and permanent business is established, and the trade here assured of an adequate capacity at the source of supply. If these conditions are created, and supported by prompt deliveries, there appears to be every prospect of success.

A gentleman, who is prepared to interest himself in the enterprise, outlines the following plan:

A combination of Canadian manufacturers, having:

An office and showroom in the centre of the cabinet-making trade, somewhere near Great Eastern street, London, in charge of

A treasurer, to be a Canadian, and have entire supervision of finances, but work in co-operation with

An English sales manager and staff, including one or more travellers. It is pointed out (and I fully endorse the opinion) that the sales manager and others who are to come in direct contact with the trade here, must be men who by long experience and association are familiar with the ways, customs, and manners of those with whom they will have to deal. Individual orders being very large, it is likely that one traveller could book all that his factories could supply, during at least the first years of the enterprise.

In case the storage accommodation of the warehouse above mentioned were limited, a temporary stock can always be kept on hand at the docks at a nominal charge of one cent per case per week—the average case being about the size of an ordinary roll-top desk.

Sales are effected on the basis of cash against documents, and prices should be quoted c.i.f. docks, London, Bristol, Liverpool, or as the case may be.

"Such confidence has the gentleman referred to in the trade to be done in Birmingham, London and particularly in High Wycombe—the seat of the chair industry—that he is willing on samples and quotations being submitted, and approved, to undertake the work of sales manager for Great Britain, and to make it a condition of his engagement that he shall guarantee minimum orders of an amount to be agreed upon during negotiations. As an illustration he offers to find a trade in chair dowels alone of £3,000 ($15,000) per annum, or more.

"Samples of the goods referred to are being sent to the Department of Trade and Commerce at Ottawa."

Mr. Fielding on the Pulpwood Question

Hon. W. S. Fielding, Canadian Minister of Finance, when reporting the result of his negotiations with President Taft, regarding the tariff, referred to the pulpwood question as follows: "There was one question of importance which engaged our attention to a limited extent. I refer to the pulpwood question. The United States would have been pleased if we could make some friendly arrangement with the Provincial Governments whereby the restrictions now made or likely to be made respecting the shipments of pulpwood to the United States might be modified. We had only to point out that this is a matter of provincial concern; that we have no right, and would not claim any right, of interference with the provinces in this matter, and so, after a little discussion, it was recognized that this was not a matter with which we could deal, and no demand was made on the part of the United States Government."

A question was asked by Mr. W. F. Maclean, if the Government was requested to do anything in connection with an export duty on pulpwood. Mr. Fielding in reply said: "The United States would have been exceedingly pleased if the Government of Canada could help them in any way to greater freedom of shipment of pulpwood, but we have made no arrangement of any kind on this point. The right of the Parliament of Canada to levy such export duty or to prohibit export remains untouched."

English Imports of Wood Goods

Imports of timber into Great Britain from Canada during February and the two months ending February were as follows:

	Quantities					
	Month-ended February			Two months ended Feb.		
	1908.	1909.	1910.	1908.	1909.	1910.
Hewn fir, oak, etc.	529	813	255	1,144	1,180	410
Sawn or split, planed or dressed	20,712	18,302	11,793	51,112	41,294	35,900
	Values—In Pounds.					
Hewn, fir, oak, etc.	2,239	3,811	1,702	4,496	4,976	2,865
Sawn or split, planed or dressed	56,662	52,662	34,570	145,698	115,301	102,001

An Excellent Annual Issue

The 37th annual special issue of the "Timber Trades Journal" forms a bulky volume of over 300 pages. The retrospect of the course of the timber trade during the preceding year is, as usual, one of the leading features. The report of a special commissioner sent last autumn to Scandinavia gives in a light chatty style an account of the development of the wood industry in Finland, and his articles are illustrated with interesting reproductions of photographs of forest scenery, sawmills, etc. Other articles are "Methods of Drying Timber" and some curious particulars concerning the construction of the wooden sashes which formed the framework of the Crystal Palace Building—formerly used for the Great Exhibition of 1851. Improvements are constantly being made in woodworking machinery and wood cutting tools, and electricity also begins to play an important part in the driving of sawmill machinery, so that the finely drawn illustrations of the latest construction of machinery and tools, accompanied by descriptions, which appear in this special issue, will doubtless be much appreciated by all engaged in the woodworking trades. The price of this special number is one shilling, and it is published at 164 Aldersgate street, London, E.C.

Montreal Personal News

Mr. George W. Goodfellow has returned from a short trip through the Southern States.

J. J. Murphy & Company have opened an office in the Board of Trade Building and will carry on a general lumber business.

Mr. C. L. Smith, for many years treasurer of the Robinson-Edwards Lumber Company of Burlington. Vermont, has been elected president and general manager of the company.

Mr. E. M. Nicholson has returned from his annual business trip to the Old Country. Mr. Nicholson states that the English lumber market shows much improvement and dealers generally hold optimistic views of the coming season's trading.

The interests of the Lumber Association of the Montreal Board of Trade before the Railway Commissioners, when the lumber freight rate case again comes up on April 19th, will be looked after by Mr. W. S. Tilston, manager of the Transportation Bureau of the Board of Trade.

Mr. Dwight J. Turner, of the Turner Lumber Company, Toronto, has been appointed a member of the forestry committee of the National Wholesale Lumber Dealers' Association.

For Sale to Close an Account

Crown Granted Timber Limits and Lands

in the

Province of British Columbia, Canada

The undersigned has received instructions from the owners who desire to close the account, to sell by private treaty

Forty Timber Limits and Lands

situate in the Salmon River Valley, West Kootenay, British Columbia, from thirty to forty-five miles north of the United States border, and upon, or contiguous to the Nelson and Fort Sheppard Railway which runs between Spokane, Washington, and Nelson, British Columbia, connecting with the Great Northern and Canadian Pacific Railways, and affording access to the United States and Canadian markets.

The limits contain in the aggregate thirty-eight thousand acres, and are comprised of bottom lands and benches of hills, constituting one of the best bodies of timber in the Central Southern part of British Columbia. Subdivision of the tract has hitherto been consistently refused. Individual limits contain from two hundred and fifty to twenty-one hundred acres, with from three million to forty-five million feet of Cedar, Pine, Hemlock and other woods of excellent quality upon them, in addition to large quantities of Cedar Poles—prices run from $5,000 up according to Stumpage and Location.

Some of the limits are essentially Cedar Pole Propositions, and contain large quantities of the very best quality of Cedar Poles from twenty-five to seventy-five feet in length, free of limbs.

The properties are Crown Granted, and the timber upon them may be exported. The Timber is subject to a Royalty of fifty cents per thousand feet, when cut.

A considerable quantity of the land is available for fruit land when cleared, and the owners are prepared to give a deed of land and timber, or a license to cut timber only for a term of years, at the option of the Purchaser.

TERMS OF SALE:

In order to close the account, very easy terms of purchase will be given, namely, twenty-five per cent. cash, and the balance in four equal annual instalments, and twenty per cent. cash with balance in six equal annual instalments—interest at six per cent.—with operating privileges which will assist purchasers to pay for limits out of stumpage.

The character of the properties together with the easy terms of payment present a unique opportunity to persons of moderate means to acquire valuable limits for either operation or investment.

Prices and further information may be had upon application.

YMIR, B. C.

Review of Current Trade Conditions

Ontario

During the past fortnight there has been just a normal market for lumber throughout Ontario. In fact, with the exception of the disturbance caused by the tariff uncertainties there have been no influences at work either to stimulate or to depress the markets. Previous to the tariff settlement there was a temporary activity on account of the desire of United States importers to secure stocks before a maximum tariff could be imposed. Now that there is no danger of a maximum tariff the trade has reverted to a noral basis. The city trade at Toronto is good but the country trade is a trifle quiet. The early starting of the mills will probably put a lot of lumber on the market sooner than is usual. Until the arrival of the new lumber it is expected that there will be just a healthy normal activity such as prevails at present, and under which dealers have to exert themselves extensively to secure the orders that ar turning up. The shingle situation shows no signs of improvement. Pacific coast manufacturers at a recent meeting decided to continue quoting $3.10 for XXX, but it is clear that this price is not being secured to any great extent, as some manufacturers are offering their stock for $3.

The tariff settlement has in a small way caused an improvement in business, because many of the retailers, expecting that a tariff war would cause a slump in prices, remained out of the market. They are now coming forward with their demands.

At Ottawa, prices for all grades are well maintained and the upper grades are holding their advances firmly since the trade in the United States picked up. The scarcity of good sidings, strips and shorts is becoming greater. An excellent sign of the improvement at Ottawa is the fact that manufacturers being unable to fill all orders for the upper grades, are permitted to substitute lower grades. There is still a large stock of mill culls at Ottawa and prices are shaky. Orders for large lots to middlemen are filled at $15 and $16 for 12 feet and up, assorted widths. There is a good demand for wide spruce stocks. Telegraph poles have advanced for the short pieces, $1.75 being paid for 25-foot poles.

The Dominion Board of Railway Commissioners have issued a notice that the freight rate case between the lumber shippers of Canada and the railway companies will be heard again on April 19th. It is hoped that the matter will then be finally disposed of.

Eastern Canada

The extensive parcel shipments of "English" spruce deals by liners during the winter have greatly reduced the stocks at St. John. Present indications are that the sawing season which has just opened will be a good one for "English" deals. It will take some time, however, for the mills to increase the stocks to any important extent, as none of them were well under way until the middle of the present month. It will be the middle of May therefore, before any considerable quantity is available for shipments. Prices for "English" spruce deals continue steady with a firm tone. In the St. John markets prices are somewhat high. An ordinary specification would be quoted at about $15.50 per M. f.o.b. St. John. It is estimated that stocks at present amount to 3,500,000 feet at the outside.

There is nothing new to report in the trade conditions of cedar shingles, except possibly that business locally at St. John was a shade more active during March. Very little of the higher grades have been exported of late to Boston, and probably business in that direction will be late in opening up. Higher prices, however, are expected. St. John dealers are asking $2.60 to $2.70 for dutiable "extras" and $2.05 to $2.15 for dutiable "clears" f.o.b. schooners, St. John. Uneasiness still continues regarding the volume of water at the head waters of the rivers in New Brunswick, as the snows have melted away very rapidly and it is feared that there may not be enough water for good stream driving.

There has been quite an improvement in the market for eastern spruce at Boston and higher prices are expected. Several mills have contracted for their entire supply of logs and are out of the market until last winter's supply reaches them. Frames 9-inch and under are selling at $24. The demand for random is slow. Large lots of Canadian random were imported before the tariff settlement was reached and offerings therefore are large. Spruce covering boards are firmer at $19. At New York the purchases of Nova Scotia spruce are not heavy but inquiries for cargo lots are coming in very frequently. The outlook is satisfactory. Cedar extra shingles are selling at Boston at $3.40 to $3.50, and clears at $2.90 to $3. The lath market is quiet, with sales of 1⅝-inch at $3.90. Very few buyers, however, will offer more than $3.80. Some business has been transacted at $3.85. The price for 1½-inch varies from $3.45 to $3.50.

Great Britain

At London, the lumber trade has been showing some activity of late. The Easter holidays interfered with the trade to some extent, but the dry weather helped to make things look more cheerful and the demand for stock was slightly improved. Prices for regular sizes in good condition remain quite steady, but it is difficult to dispose of stocks that are at all off grade. At Churchill & Sim's recent auction sale a lot of 3x7 and 8-inch first spruce sold at £14 10s. Unsorted bright Quebec 3x11 brought £10 and £9 15s., and the 9-inch sold at £9 10s. 3x8 Quebec brought £9 5s., and the 4th St. John, 3x11 and 9-inch, sold at £7 5s. 8 and 7-inch brought £6 15s. Dry Quebec birch planks were in poor demand and brought only 10½ and 10d. Prime unsorted Oregon sold at 1s. 5d.

Arrivals at Bristol by liners have been quite light and the trade generally has been quiet. Some of the inland buyers have been making enquiries, but have apparently decided not to buy at present. The almost certain prospect of another general election is acting as a disturbing element.

The Easter holidays interfered considerably with the trade at Liverpool, but the market is fairly active. Here also the political situation is interfering seriously and it is not expected that any material improvement will occur until the next elections are over. The wholesale business at Liverpool has been very dull. Stocks of spruce deal at Liverpool on the docks and in the yards are lighter than they have ever been and no important transactions are occurring. The larger importers are holding aloof from the market. There is nothing new to report regarding the position of Canadian pine as all the large transactions for 1910 were closed some time ago. Sales from stock, however, are very small, which is usual at this time of year. There is a scarcity of Quebec birch logs and new imports will probably meet with a good demand. There has been a fairly active demand for Quebec pine of good quality, particularly in the siding sizes. Stocks of 1-inch and 1¼-inch better grade siding have almost disappeared.

At Manchester, prices are steady, especially for spruce deals. The week preceding Easter was, as usual, a quiet one. However, the stocks are moving very nicely and empty spaces are showing up in several of the storage grounds.

There is little or no change to report in lumber trade conditions at

Glasgow. Stocks are moving at an apparently steady pace. The position of the market on the whole is healthy.

United States

Lumber trade conditions at Chicago during the past fortnight have been marked by considerable improvement, as a result largely of the continued pleasant weather. The retail trade is very active and the indications are that the building season will be a splendid one. Prices of northern pine at Chicago show a tendency towards advance and the volume of business is greater than it was a year ago. March, in fact, was a splendid month. Prices for northern pine are very firm for everything from No. 2 and better up. The trade in hardwoods at Chicago is very active and there is a scarcity of brown ash, rock elm, soft elm and birch. Oak continues scarce, especially plain sawed, both red and white. Common quartered white oak is plentiful, but first and seconds are selling well. White ash is in good demand and scarce. Hemlock at Chicago is also enjoying a good demand as a result of the fine weather and the consequent increase in building. Prices are better than they have been for some time, and it is confidently believed that the weakness of last year has been entirely overcome. The upper grades of southern pine are moving well at Chicago, especially the heavy construction material, and prices are strong. There is encouraging activity in shingle and lath at Chicago. Red cedar shingles are stiffening, especially for the clears, which are 5 cents a thousand higher.

Market Correspondence

Tariff Settlement Assists Ottawa Markets

Ottawa, April 12.—"A very good thing for the lumber industry that the tariff trouble with the United States was settled. Good for the lumber industry, because it is good for business of all kinds in this country. That is my view as a lumberman of the agreement just made which saves Canada from the penalty of the United States maximum clause."

So spoke Senator Edwards, large lumber manufacturer of the Ottawa valley and a very prominent Government supporter. Senator Edwards does not take the view that the Ottawa valley is dependent on the United States for a market for lumber, but appreciates keenly the disturbance in trade conditions that would follow a tariff war.

Mr. Peter Whelen, manager of Shepard & Morse Lumber Company, and president of the Ottawa Board of Trade, affirmed that the termination of the long period of uncertain tariff conditions would give an impetus to the lumber trade. The lumbermen had no complaint o make of prices, for many lines were very firm, but naturally American buyers were unable to place orders while the maximum tariff was hanging over their heads.

A prominent Ottawa dealer asserted that the greatest effect on the lumber trade caused by tariff conditions was noticed in the business with Montreal. Dealers there depended on a tariff war to produce a slump in Ottawa valley prices and held back. They are in the field now, and buoyant trade is the reward of manufacturers who resisted the attempt to force down rates when the lumber outlook was vague.

Leading Ottawa manufacturers are looking forward to the international conference on the tariff to secure a reduction in the tariff on lumber entering the United States. That the tax of $1.25 a thousand is far from trifing was a point one of them strongly urged. In order to place the lumber business on a paying footing he claimed that the American tariff would have to be wiped out. According to this authority, the bulk of the lumber is sent across the border on a margin of profit far less than the $1.25 duty charged by the American Customs officer. This appears to be especially the case with low grade lumber. It is claimed that since wages took the marked ascent a few years ago and shanty supply advanced, low grade lumber has been manufactured at a loss and the mills are only run on a paying basis through the better market for fine stock. Any arrangement that would stiffen the prices for middle and low classes of pine would confer a boon on the trade and enable lumbermen to make the profits realized a few years ago.

In other quarters it is argued that unnecessary cutting of prices has placed cheaper lumber in the position of making loss for the producer. Nevertheless, a request for freer access to the American market is general among the lumbermen.

With the American market secured, even on the former basis, all current rates are well maintained. Upper grades, though they have advanced more than medium classes, are very firm. The scarcity of good sidings, strips and shorts is all the more accentuated since the trade across the border has assumed normal conditions. Manufacturers are not able to fill all orders for the higher qualities, but the demand is keen enough to permit of stock being substituted when it comes near to filling requirements. There is no better sign of buoyant trade.

Mill culls are still plentiful. The prices are uncertain and big lots can be obtained from middlemen around $15 and $16 for assorted widths, 12 feet and up. The stocks are heavy as a result of the over-optimistic views of dealers in 1907, who have held on to lumber ever since.

A strong demand prevails for wide spruce stocks. There is a large movement of this lumber since the spring shipping began and local consumption is heavy.

The active buying of telegraph poles for repair work and prospective railway building has advanced the prices in short pieces. 25-foot poles have sold as high as $1.75 each and dealers find it difficult to fill all the orders. It is probable that many lumbermen will sort out more cedar than last year for poles. At $1.25 and lower, cedar had produced more profit when manufactured into shingles or standard ties. Since the destruction of many hundreds of poles last year by a blizzard on the C.P.R. west of Peterboro, the Ottawa valley stocks of poles have run low. The present session of Parliament gave incorporation to the Rideau Valley & Brockville Railway Company, which proposes to run from an iron mine ten miles north of Ottawa to Brockville, and commence construction at once. There are enough railway projects in the vicinity to warrant a very good market for both ties and telegraph poles.

J. R. Booth has just received word from the foreman of camps which broke up a couple of weeks ago and he finds that a much larger proportion of logs than he expected will be delivered to the streams. If the season had been an ordinary one most of the manufacturers would have put in another month in the woods. The demand for river drivers is strong and employment agents report that the log movement will be more rapid in the early part of the spring than usual. The season is a full month ahead of 1910. March last year gave a snowfall of 24 inches in the Ottawa valley, compared with 5 inches this year. The mean temperature was ten degrees warmer this year. This had a remarkable effect on towing logs. On April 2nd the tug Cliffside, owned by the Ottawa Forwarding Company, left the foot of the Rideau locks to tow a big boom of logs up from the mouth of the Salmon river. The steamer Victoria, of the Ottawa River Navigation Company, made its initial trip of the season from Ottawa to Thurso on the same day. The Hawkesbury Lumber Company also brought a tow of logs down the river a month earlier than any spring of recent years. The Ottawa river has been rising since the middle of March, but there is no sign yet of the north waters, which will make the most pronounced rise of the year. If there is no interference with the operation of the mills through flooding, the approaching summer promises to witness a large output of lumber. McLaughlin Bros., of Arnprior, have arranged to begin sawing next week, which will give them a month's start on last year. The Ottawa mills will also get an earlier start, a circumstance that greatly helps shipping when the dry lumber in certain lines is scarce.

W. J. Mohr, of Killaloe, is building a new mill at Barry's Bay. It will be nearer the source of supply than the present plant at Wilno. W. H. McAuliffe, who recently leased the yards of the Ottawa Lumber Company, has purchased the retail business of the Stewarton Lumber Company. The latter was put on the market when its manager, George A. Little, was appointed street superintendent of the city of Ottawa.

Rates quoted for dry pine from Ottawa to New York are $2.50 per thousand. Last season the rates ranged from $2.50 to $3. The prospects are that there will also be advances on the present schedule of the Inland Seaman's Union. Frequently vessel owners have declined to send a boat unless an advance of 25 or 35 cents is made on the schedule rate. The Ottawa Transportation Company are making no change in their tariff. The company have no published schedule, but the contracts with individual shippers are being made on the same terms as last year. One new barge, the "W. Rutherford," is being completed for the summer's work. The early spring has no effect on the beginning of river transportation, as the company has to wait for the opening of the canal at Grenville on May 1st, as usual.

Manufacturing Started at St. John

St. John, N.B., April 8.—The past fortnight has marked the opening of the manufacturing season, Messrs. Stetson, Cutler & Company having begun operations at their Indiantown mill and at their Pleasant Point mill a few days ago. The month just ended has been the quietest month in sawing circles for many years, there having been absolutely nothing doing in this line all through the month, a very unusual circumstance.

The winter liners will have soon resumed their trips to the St. Lawrence and shipments of "English" deals through the channel will have ceased for the season. Shipments of this nature, usually consisting of parcels from $25,000 feet to 300,000 feet, have been very frequent all through the winter. The largest of these shipments consisted of a few thousands over one million feet—an exceptionally large parcel to go forward in this manner.

Owing to the frequency of the parcels shipments by the winter liners, local stocks of "English' spruce deals have been greatly reduced, the quantities which have gone forward having been greatly in excess of those received from outside provincial points.

The prospects for manufacture of "English" deals in this section indicate that the season will be a good one in this respect providing, of course, there should be no failure of the drives or any like contingency, although, with local stocks greatly depleted, it will be some weeks before they are augmented to any important extent, as none of the mills which

FLEMING BROS., Chemists

TORONTO, CANADA

saw "English" stock will be well under way until the middle of the present month. Under these circumstances it will probably be the middle of May before any important quantity of "English" will be available from local sources.

Local values of English spruce deals continue unchanged, although quite firm and with a tone that indicates confidence in the situation on the part of those most interested. Prices in local market circles are high—higher perhaps than might be compatible with prices in other parts of the province.

The present local value of "English" deals, in a specification containing say 50 per cent. sevens and eights, 35 per cent. nines, balance elevens and wides, would be in the vicinity of $15.50 per thousand superficial feet, f.o.b. St. John.

The present quantity of local stocks in this line would not aggregate more than three and one half millions of feet.

The trade in cedar shingles has been marked by no developments of an important nature, although local business was brisker during the month of March than for some time previous. In the higher grades there has been little business for export to Boston and vicinity. Business in that direction, it is expected, will be somewhat late in opening up, but it is thought will bring higher values. It is generally felt that, nominally, the value of shingles has been higher, but so little has been doing that there has been no improvement in price that could be called general. Local dealers are quoting dutiable "Extras" at $2.60 to $2.70, and dutiable "Clears" at $2.05 to $2.15, f.o.b. schooner St. John.

The conditions at the head of the rivers in New Brunswick are such as to cause considerable uneasiness. The snow has dwindled to such an extent that it is feared there may not be enough to make a good run of water for stream-driving. As the time approaches when operations should begin the anxiety of those most interested becomes more acute. It is stated that it will be a "rain freshet" this year, this term meaning that the freshet will be caused more by the rains than by the melting of the snow, as is ordinarily the case.

Continued Improvement at Montreal

Montreal Office of the "Canada Lumberman."
April 11th, 1910.

A steady improvement continues to be noted in lumber circles in Montreal and vicinity. Retail yards report a splendid business for the month of March, and in some cases dealers state that their sales are 50 per cent. in advance of the same period last year. 222 building permits were issued in March, reaching a value of $676,804, compared with March, 1909, these figures show a growth of 103 per cent. For the first three months of the year the value of the permits issued totalled $1,093,244, while for a similar period in 1909 the permits aggregated $731,725.

The retail yards are not buying very extensively from the wholesalers, but in many cases this is because they have carried surplus stocks from last year. Manufacturers state that lumber is moving a little more freely to the American side. The satisfactory adjustment of the maximum tariff difficulties has resulted in a brisker movement in lumber. Enquiries are now more numerous and the Boston market is buying spruce boards fairly freely. The shingle market is still quiet, but prospects are brightening considerably.

Lath are still scarce and commanding high figures. The present season's cut will not do much to relieve the pressure, as was expected, most of this stock having been sold in advance. Several of the large Ottawa dealers are not in the market this year with lath.

All hardwoods are fairly quiet with prices steady. Quartered white oak is in good demand and continues to bring stiff prices.

Considerable speculation is being indulged in as to the ultimate pulpwood policy that will be adopted by the Quebec Government. It is reported that the exporting of pulpwood to the United States will be prohibited and that as there will also be substantial increases to the rental asked at the present time for Crown timber limits, stumpage dues, it is further stated, will be increased. Government timber limits are released year by year, the lessee having the right to renew, provided all stumpage dues have been paid.

In 1900, at the request of limit-holders, an order-in-council was passed by which the Government agreed not to increase the rental over a period of ten years. This agreement expires in September, and it is expected that higher figures will be asked. The present stumpage on pulpwood cut on Government lands is 65 cents per cord, with a rebate of 25 cents for that manufactured in the province. It is anticipated that a prohibitive duty on pulpwood would lead eventually to the establishment of mills at Canadian points by several of the large American concerns.

Lumber manufacturers state that log driving conditions throughout the Province of Quebec, with the exception of the south shore district, are not particularly favorable at the present time. Low water conditions exist, and practically all the snow has disappeared, so that the salvation of the spring logging operations is dependent altogether upon the amount of rainfall within the next month. In the Gaspe district several of the manufacturers are still engaged in hauling logs.

Burns Saws

A Lumberman from Ottawa Valley writes us as follows:

DEAR SIRS:

The Solid Tooth Saws I purchased from you last spring have been doing first class work ever since. I have never had any trouble with them. The Burns Saws are the best, as they are evenly tempered and will keep an edge longer than any other make of saw used here. Yours truly.

THE ER BURNS SAW CO. LIMITED

EDGINGS

Ontario

The Keewatin Lumber Company's mill at Kenora started for the season's run on Monday, April 4. A good supply of logs is one hand and a splendid season's run is anticipated.

The Western Lumber Company, Limited, Toronto, Ont., has been incorporated. The incorporators are: Gerard Godfrey Ruel and Geo. Frederick Macdonnell, barristers-at-law, Toronto, Ont.

The Owen Sound Lumber Company, Limited, Owen Sound, Ont., has been incorporated with capital of $50,000. The incorporators are Harry Edgar Rowland and John Morris Rowland, lumber merchants, Owen Sound, Ont.

The Lepage Lumber Company, of Wabigoon, Ont., of which J. S. Lepage is president, have purchased the lumber business of Alphonse Lemay, at St. Boniface. The company have retained the services of Gedeon Lemay as manager.

The Crossen Car Company, Cobourg, Ont., have been incorporated with capital of $1,000,000, to carry on business of contractors and lumber manufacturers. The incorporators are Alexander Falconer, advocate, Westmount, Que., and Benjamin Ginsberg, Montreal, Que.

F. C. McInnes, Leeburn, Ont., has rented his mill to Hector McDonald, of Rydal Bank, for the year 1910. Mr. McDonald has over 200,000 feet of hardwood to saw this season and will add an edger to the plant. Mr. McInnes reports an improvement in the hardwood market.

The National Timber & Pulp Company, Limited, Toronto, Ont., has been incorporated with capital of $500,000. The incorporators are: William Percy Gillespie, broker, Toronto, Ont.; Hubert Chas. French, contractor, Winnipeg, Man., and Ivers Philip Lawrence, wholesale lumberman, Fitchburg, Mass.

The Ludlam-Ainslee Lumber Company, of Leamington, Ont., will erect a plant at Hamilton. A site in the annex district has been secured by the company and building operations are to be begun at once. As a start, about 100 hands will be employed. In the near future the capacity and the number of employees will be doubled.

The railway committee of the House of Commons have approved of a bill for the incorporation of a car ferry company at Morrisburg, Ont. The ferry is intended to carry Canadian wood pulp across from Morrisburg to Waddington, N.Y., where there is a considerable amount of paper manufacturing. It will connect the Grand Trunk and New York Central railroads.

McCamus & McKelvie, New Liskeard, Ont., are building a new mill at North Cobalt. Part of the timber from their limit comes out on a chain of small lakes, which come within a few rods of both the T. & N. O. Railway and the electric line. The new mill is a circular of about 30,000 M. capacity. At their New Liskeard mill they will saw the logs that are put on Lake Temiskaming.

Messrs. F. Kent and M. B. Seaman, members of the firm of Seaman & Kent, of Meaford, Ont., manufacturers of hardwood flooring, visited Fort William, Ont., during the first week of April, for the purpose of meeting the city council to discuss the establishment of a factory in Fort William. Construction work will shortly be commenced on the factory, which will be one of the largest buildings of its kind in Canada. The factory in Fort William will employ 200 men at the start, and additional men will be hired as the work demands. It it hoped that the factory will be ready by the first of August.

It was expected that if the favorable weather conditions continued, Eddy Bros. & Company, and the Moulthrop Lumber Company, both of Bay City, would start their Ontario mills by April 15th, as these two concerns have large quantities of old logs carried over to enable them to begin sawing. All the mills in their district are expected to be in commission by May 1. Eddy Bros. & Company's plant will cut over 12,000,000 feet of lumber for E. B. Foss & Company, of Bay City. The firm's private cut will go to the Mershon, Eddy, Parker Company, on the Saginaw river. Foss & Company have stocked the Burtis & Company sawmill at Thessalon, Ont., for several years.

Eastern Provinces

The Talbot-Allard Lumber Company, Limited, Outremont, Que., have been incorporated with capital of $300,000. The incorporators are: Wilfrid Talbot, trader, and Jos. Charbonneau, agent, both of Outremont, Que.

The Tourville Lumber Mills Company, Limited, Montreal, Que., have been incorporated with capital of $250,000. The incorporators are: Rodolphe Tourville and Arthur Tourville, manufacturers, Montreal, Que.

The Verdun Lumber Company, Limited, Verdun, Que., has been incorporated with capital of $20,000. The incorporators are: Messrs. L. J. Marchand, manufacturer, and Geo. N. Monty, accountant, of Emard, Que.

The Manitoba Land & Timber Company, Limited, of Montreal, Que., have been incorporated with capital of $400,000. The incorporators are Geo. Vipond Cousins, accountant, and Patrick Francis Brown, clerk, Montreal, Que.

Mr. W. S. Montgomery, of Dalhousie, N.B., estimates that the lumber cut on the northern shore will be larger this year than ever before. He states that it would be hard to imagine better conditions for cutting and hauling than prevailed during the past winter.

A malignant type of diphtheria is reported to have broken out in one of the lumber camps on the Tobique River, N.B., at the close of the logging season. After two men had died, the rest of the crew deserted, and, in order to prevent the disease spreading, the buildings in the camp were all burned to the ground.

The latest reports from Campbellton, N.B., were to the effect that the option obtained by outside parties upon the lumber business and properties of the Wm. Richards Company has not been exercised, but that a request had been made for extension of the option and it is still possible that a deal may be put through.

It is expected that within a very short time the extensive pulp mill at Seven Islands, Que., which has been in course of construction for six years past, will be completed. Some $2,500,000 have been expended upon the property. Nine cargoes were shipped last year and it is expected that 150 tons daily will be the regular output when the mill is in full running order.

It is reported that Mr. I. C. Prescott, the well known lumberman of Al-

bert, N.B., is considering the sale of his property at an early date to an American company which has made a deposit of $3,000. The property contains one of the most valuable timber areas in that part of the province, including about 30,000 acres, 14,000 being in fee simple and 16,000 held under license from the Government. The price asked is understood to be $75,000.

B. M. McCraith and M. L. Parnell, of St. John's, Newfoundland, were visitors at Toronto recently. They report that several large plants for the manufacture of wood pulp will be established in Newfoundland this year. While in Montreal they completed a sale of 500 square miles of Newfoundland spruce lands to Dr. J. H. F. Blue, of Montreal. They report also that Mr. D. McMartin, of New York and Cobalt, will establish a pulp mill this summer on the 3,000 square-mile limit which he purchased last year in Labrador.

Western Canada

The Elk Lumber Company, Fernie, B.C., will run their mill night and day during the present season.

G. B. Gordon, lumber manufacturer, Gilbert Plains, Man., has been succeeded by Logan & McDonald.

The Crow's Nest Pass Lumber Company expect to make a record cut of 35,000,000 feet of logs this season.

The Fraser River Mills. at Fraser Mills, B.C., are reported to have cut 6,445,000 feet, and sales are reported to have been very brisk.

The city of Nelson, B.C., has closed a contract with the Doukhobors for 10,000 feet of cedar. The timber will be rafted from Waterloo to Trail.

The Corona Lumber Company, Winnipeg, secured the contract recently for the supply of lumber for the construction of the new grand stand at the Industrial Exhibition.

The Porto Rico Lumber Company started a couple of their planers in the mill at Mayo, B.C., on April 1st, and will commence operating the complete mill about May 1st.

The forestry department of the C.P.R. will spend a large amount of money this year along the right of way from Moose Jaw to Medicine Hat and Calgary in planting rows of trees to replace the temporary storm fences now in use.

The logging operations in the northern woods of Saskatchewan came to a conclusion this year earlier than any previous year in the history of the lumber industry. They were practically completed by the third week in March, whereas in 1909 they continued until the first week in April.

The Hanbury Sawmills, at Brandon, Man., which have not been operated for the last three seasons, will be running again this year. Extensive improvements have been made in rebuilding the log boom in the river just above the mill. Hanbury's timber cut during the winter was about three million feet.

Reports from Strathcona, Alta., state that the up-river camps have secured a cut of between eight and ten million feet. The sudden arrival of spring left many of the camps more or less stranded in the woods or that they had very difficult work getting back to town. The winter was an ideal one for lumbering.

Statistics of the timber transactions for the province of British Columbia during the month of February show that 638 licenses were issued for areas west of the Cascades. The receipts for them were $89,556.25. For the areas east of the Cascades, 466 licenses were issued, bringing $53,780.10 to the treasury. Timber transfer fees produced $538; penalties, $2,175.

A number of improvements are being installed this spring by the Brunette Saw Mill Company, at Sapperton, B.C., so as to increase its capacity for producing dressed lumber. The improvements include a number of the latest design of planing machines, operated by electricity. During February the mills cut about 2,000,000 feet of lumber and sold about 1,750,000 feet.

The Timber Land Lumber Company, of New Westminster, B.C., which has recently been organized, has purchased a mill and timber holding from P. Devoy and F. Owens. They will increase the capacity of the plant to 50,000 feet a day. The stockholders in the new company are: A. J. Craig, B. W. Craig, W. K. Craig, H. H. Craig and J. A. Gibson. A. J. Craig is managing director.

The Yale-Columbia Lumber Company started its mill at Nelson, B.C., about the middle of March with a full force of 75 men, cutting about 60,000 feet per day. They expected within a month to operate both night and day for the balance of the season. About 5,000,000 logs have been cut for its mill at Creston. The mill at Cascade will be run on time and a quarter all season. About 15,000,000 feet of logs have been cut for it.

The Red Fir Lumber Company, of Nanaimo, B.C., are opening two new logging camps in the north. Many improvements have been made in the mill during the past year and its capacity is now 45,000 feet per day. A new drying kiln has been completed with a capacity of 50,000 feet per day. Two new machines, a sash sticker and an inside moulder, have been installed, and preparations are being made for the improvement of the present engine, so as to add 35 per cent. to its power.

Mr. C. G. Kay, of Vancouver, has announced that the National Paper Mills will erect a pulp and paper making plant near the Fraser River Mills, B.C. About $150,000 will be invested in the enterprise and the mill is expected to be ready in about 12 months. The plant will have a capacity of ten tons of paper per day, and will employ about 30 men, which will be increased subsequently to 100 men. Others associated with Mr. Kay in the enterprise are Mr. Wright and Sylvester Cropper, of Vancouver.

The B. C. Gazette gives notice of the incorporation of the following companies: The Howe Sound Timber Company, Limited, capital $50,000; the Quance Lumber Company, Limited, capital $30,000; Trout Lake Lumber Company, capital $100,000; Slocan Lake Lumber Company, Limited, capital $100,000; Cedar Cove Sash & Door Company ,Limited, capital $15,000; Fort George Supply Company, Limited, to build and contruct sawmills, etc., capital $50,000; John R. Bowes Timber Company, Limited, capital 10,000.

The British Canadian Lumber Company, Limited, a newly organized company, have purchased the Pacific Coast Mills, one of the largest in the Province of British Columbia. The price paid is in the neighborhood of $600,000. The property includes the buildings, plant and stock on hand and the valuable mill site on Coal Harbor. The only Vancouver representative in the new company is Mr. F. L. Buckley. The capital stock is $2,000,000, and Mr. Buckley is to be manager. The capacity of the plant, which has been greatly improved during the last few months, will be 150,000 feet of lumber and 300,000 shingles. The British Canadian Lumber Company intend to open their own logging camps immediately and to build several miles of railway. In the meantime, while this is being done, they are making contracts for all the logs required for immediate use.

The Height of Reliability is Reached in

Hespeler Band Re-Saws

They do the Best Work at the Least Expense

These Band Re-Saws are made in three sizes carrying saws 3, 4 and 5 inches wide. They embody all the newest conveniences and attachments for any kind of Re-sawing within their capacity. They have ample power both on the blade and on the feed works for all important demands. These are some of their important features:

The Frame is cast in one piece, cored out hollow underneath, is heavily ribbed and perfectly rigid.

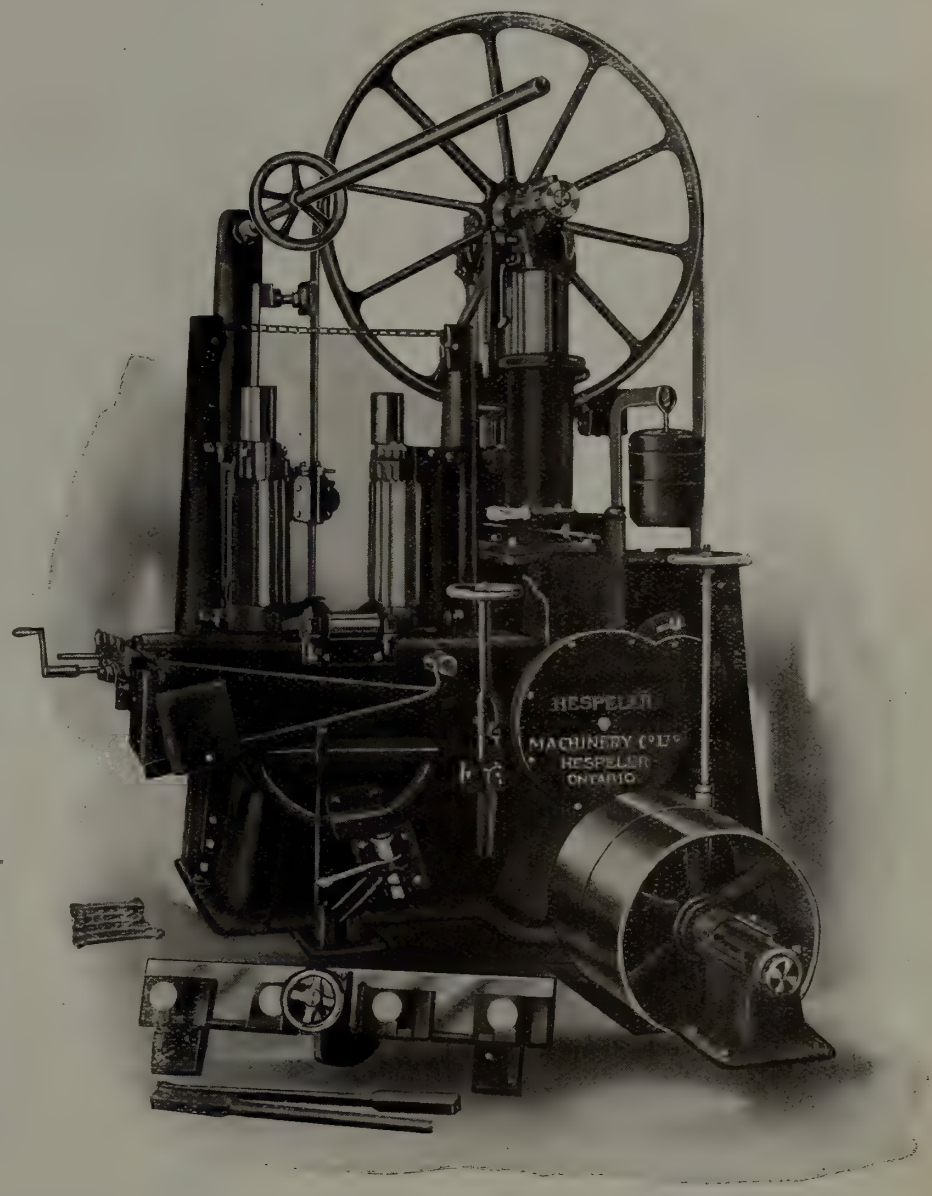
The Wheels are cast solid of ample strength, and are so designed as to give a large factor of safety when running at the tabulated speeds. The lower wheel (it will be noticed) is very heavy with a solid web in the centre. Faces and Edges of both wheels are accurately ground on their own journals and balanced as near perfectly true as human ingenuity will permit.

The Feed Works are driven by belt and changing from one feed to the other can be accomplished by simply turning a hand wheel one quarter of a turn. Each machine has five changes of feed.

The Rolls are driven by spur and bevel gears all cased in. All gears cut from the solid and as near noisless as possible.

Six Feed Rolls carry the stock to the saws all of which are driven by gears cut from the solid. The right hand rolls are rigid in their boxes, but the left hand rolls have enough elasticity to grip all uneven stock.

The Self-centreing Attachment is so arranged that by one movement of handle the rigid roll becomes adjustable so that you can have a complete self-centreing machine, or by one movement of the handle the right hand roll becomes rigid again. This does away with the use of a wrench in making the machine self-centreing.



The Rolls will tilt from 0 to 1 inch in 6 inches to allow for the successful sawing of clap board and general bevel work.

The Tension on the blade is accomplished by double acting knife balance levers with detachable weights.

The guides have adjustable hardened steel back flat rollers with front and side blocks, adjustable or planed ways. The upper one is counterweighted and instantly adjustable vertically to the width of the stock.

The Saws run within 1 inch of the centre of the back rolls, cutting the stock while it is firmly held. When doing bevel sawing the feed works can be drawn back by a lever to prevent the saw striking the rolls and the safety lock is so arranged that the rolls can not be tilted until the feed works are drawn back from the saw.

Cleaners are provided on both wheels. A packing box is attached to the lower wheel guard, which should be kept filled with oily waste to soften the gum which often collects.

Our high grade Wood Tools eliminate all troublesome features. They insure largest life and highest efficiency.

We supply complete outfits for planing mills, sash and door factories, carriage, wagon, piano, furniture factories, etc.

Shipments made to all parts of Canada on short notice. Direct connection with G.T.R. and C P.R.

Berlin Quality Counts

A Moulder with "Get-At-Able" Adjustments

Neither an inside nor outside machine but a combination of the good features of both.

Time was when moulding at 40 feet a minute was considered phenomenal. The work was pretty rough but the capacity was there.

There are a good many moulders in use right now that do well to turn out even 40 feet a minute. One of our salesmen had an experience the other day that was interesting.

He called on a large concern manufacturing refrigerators. The manager said there was nothing needed in the machinery line but invited him to go through the factory. In their walk, they found a moulder running about 40 feet a minute. Picking up a piece as it came from the machine, our salesman said "Mr. Manager, that's pretty rough work. WE'RE MAKING A MOULDER THAT I WILL GUARANTEE TO DO BETTER WORK AT 75 FEET THAN YOU'RE NOW GETTING AT 40 FEET."

That set him to thinking, for if he could get better work at twice the feed and with the same machine crew, he could reduce productive cost at least 50%. That man to-day has a No. 108 running in his factory.

Perhaps conditions in YOUR plant are similar—you may not realize just what our No. 108 Open Side Moulder will accomplish.

There are many details of the machine worth investigating. We've a large folder showing front and rear views, and which contains a complete description. Write for one—to-day—or ask us to send a representative to talk it over with you.

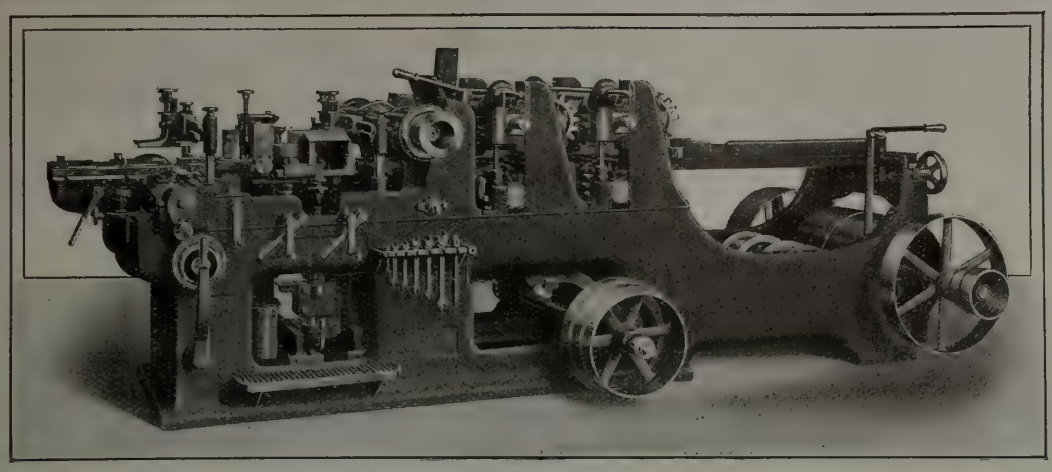
Ballantine Machines are Reliable

They can be absolutely depended on to work right up to their limit, day in and day out, year after year, for they are as carefully constructed in the smallest details as in the most essential parts. Hence, their first cost is the whole cost.



No. 103 Moulder on Base

This moulder is without exception the heaviest machine of its class on the market. It is adapted to fine work and fast feeding, many being run at 80 or 90 feet per minute. The simplicity of all its adjustments and its unrivalled strength and accessibility make it a favourite wherever used. All adjustments are made from the working side without wrenches. The table can be locked to four columns and the frame and so made as rigid as a solid bed.

REAR VIEW No. 107.

RESULTS ARE WHAT COUNT

A Combined Skidding and Loading Machine that will clear up the largest area at a setting and can be moved and set up in the shortest possible time will get the best results.

The latest Russel machine has some distinct features that save time and trouble, consequently money. Note the new method of suspending skidding sheaves. They are hung from a vertically hinged jib or triangle, the outer end of which is guyed by two lines one on each side, which are power-tightened and can be set while skidding lines are going out. The guy lines lead back so they do not interfere with skidding or loading. The uppermost leg of the jib has a spring connection to the tower, reducing shocks. All

skidding strains are absorbed by the guy lines. The swinging boom is operated by wire ropes passing through sheaves suspended from a steel frame projecting from tower and leading to two drums on loading engine, controlled by one lever. Machine is raised or lowered by hydraulic or patented gear jacks. Built for 2 or 4 lines, with stiff or swinging boom, constructed entirely of steel, except loading boom. Is without question the strongest and fastest machine of the day.

RUSSEL WHEEL & FOUNDRY CO., DETROIT, MICH.

A NEAT AND COMPACT EDGER

This cut represents our No. 3 Edger

This machine is built for those requiring a very neat, compact and substantial edger.
The arbor runs in 3 long bearings, the main pulley being between two of them.
There are 3 saws 16 inches diameter, one stationary and two movable.
Made in two sizes, 36 inches and 42 inches.

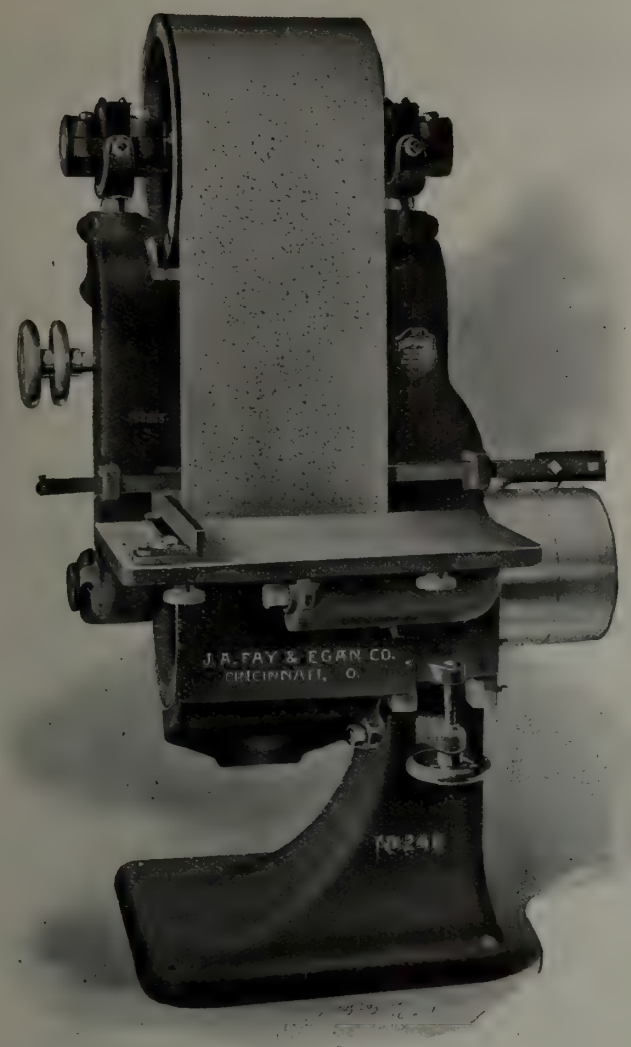
It's Worth Your While

to investigate the merits of the Shimer Cutter Heads, especially their efficiency in maintaining uniform patterns, and banishing trouble from the mill.

The Permanent Make-Ready

built into the Shimer Cutter Head saves the filing and fitting to pattern each time you sharpen the cutters. No matter how modern you may consider your equipment, if your machines are not fitted with tools to enable you easily to maintain UNIFORM PATTERNS you cannot hope to attract and hold the better class of patrons.

Your Investigations



will also prove to you that the Shimer Cutter Heads are worthy of careful attention as a means of reducing operating expense and increasing output. The illustrations herewith show how compact and workmanlike these tools are constructed—how the vital principle of clearance is applied to all leading Bit points—how the alternate and shearing effect of the cut reduces to a minimum the tearing out tendency in working cross-grained and knotty lumber.

We will be glad to have you write us explaining what your Cutter Head requirements are. Our pleasure in hearing your troubles will be equalled only by your pleasure when they are removed.

SEE THAT YOU GET THE GENUINE

Look for the NAME and TRADE MARK **"The Shimer Cutter Head"** stamped on every Head we turn out. A dealer who would sell you an imitation means to deceive you—send them back and demand the genuine article with our guarantee for your protection.

Branch of Milton, Pa. **Samuel J. Shimer & Sons,** **Galt, Ontario, Can.**

Write for Sheet No. 19-T.

This New Sand Belt

can be used to advantage in Cabinet, Furniture, Desk and Planing Mills,

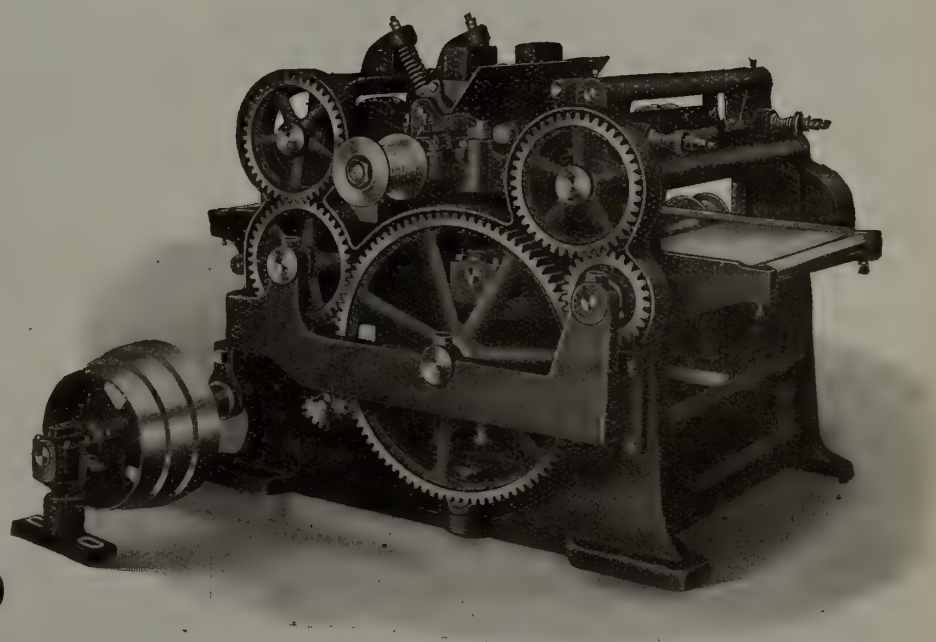
BUT WE FIND

The Box Manufacturer

can use it to greater advantage than any other class of woodworkers. After the box is completed —its entire outer surface can be sanded on this machine and the corners may be rounded if desired.

CAPACITY:

Sanding surface is 14 in. wide and 24 in. high



Designed Especially for Planing Mills and Box Factories

CAPACITY:

24, 27 and 30 in. wide by 8 in. thick

The general work of the planing mill and box factory requires a planer of special construction. It must be so well made that it will stand up serenely to the roughest kind of usage, and at the same time so finely made that it will do light and delicate work perfectly.

This Machine, known as our No. 140 Double Surface Planer, is made that way

Eclipse Clapboard Planer

If you are a stranger to them and they to you. Get acquainted.

"This is One of Three in the Family and Every One a Wonder'

Said the head of one of the leading **Clapboard Manufacturers** the other day. He based his opinion on a "working acquaintance" gained in their own mill. On the start he was against us but is now another one added to the hundreds won over and convinced—as we want to convince you.

SLEEPER & AKHURST Coaticook, Que.

NO COMPROMISE

There is no such thing as a "good enough" standard in the great Disston establishment—a thing is RIGHT or it is WRONG. There can be no compromise.

Followed for 70 years, this principal has built the Disston Enterprise from a one-man-shop to the greatest saw, file and tool industry in the world.

Even if we could not save you money in many ways, it would be to your best interests to associate yourself in a business way with such an organization.

But Disston Saws DO work marked economies for every user.

They do more work, faster work, better work than any other saws made.
They save power in every mill that uses them.
More work goes into a Disston—more comes out of it.

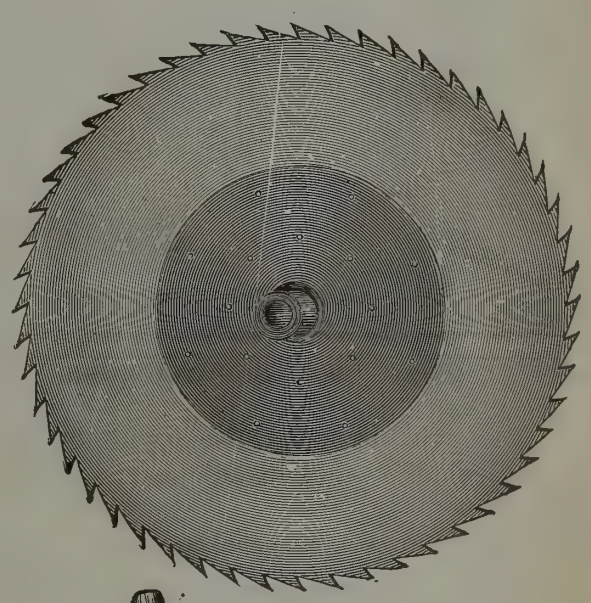
We are the Sole Manufacturers of Saws under the Simond's Process in the Dominion of Canada

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

INSERTED TOOTH SAWS

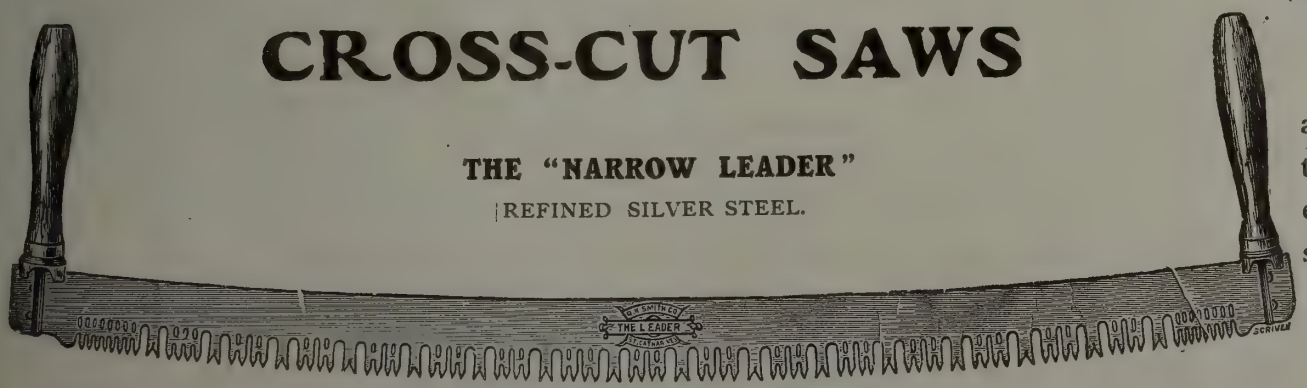


Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws pertectly.

SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.



Run a "Simonds" and you will increase your output.

CROSS-CUT SAWS

THE "NARROW LEADER"

REFINED SILVER STEEL.

The Simonds Temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

4 Saw Lath Bolter

We build a full line of Lath Machinery, and will be pleased to submit full particulars on application.

This machine speaks for itself.

Improved Hot Blast Grate

This is the latest production in the line of Hot Blast Grates. With this grate the blast is evenly distributed over the whole surface of the grate so that when sawdust is being used for fuel, it requires little if any attention, as it is evenly consumed.

This is not the case with other styles of Hot Blast Grates where the blast is not evenly distributed.

Our Hot Blast Grate develops more heat from green, wet or frozen sawdust or mill refuse than an ordinary draught grate develops from wood or coal. Increases steaming power of boiler 50 per cent. It will save you money regardless of the kind of fuel.

We will ship our Hot Blast Grates to any reliable person or firm on 30 days' trial, to be returned at our expense if not as represented.

SUITABILITY

You couldn't file a saw with a manicure set—neither could you use a hand machine to edge 8 in. and 10 in. Cants.

If you are running light stock on a heavy edger, half your machine is idling—you are wasting floor space and you are not getting full returns for your investment. On the other hand, if your machine is too light for your work—you are forced to crowd it—your saws will heat and bind and your lumber will be snaky and uneven—you suffer in both cases.

We have had 60 years' experience as Canadian Saw Mill Builders. We manufacture a complete line of Edgers—hand, light, medium and heavy style—varying in size from 30 in. to 96 in. opening. No matter what stock you are handling, we have the Edgers—in style and size—most suitable for your work. Our Bulletins on Request.

SIMONDS

Inserted Point Saws

Made in Montreal

Are you buying a new saw this winter? Then listen to what some other mill men say about the Simonds Saw. We quote from their letters. "As near perfection as one could be made for our mill." "Miles ahead of any other—would not take $100 in gold for it." "Our favorite saw in the mill." "First class, works fine." "Runs equally well winter or summer." "Your saws have proved the best I ever used." "It's the only saw I can get to stand up in frozen timber."

Some of our friends may be over enthusiastic, but there you have their own words. Isn't it enough to cause you to hesitate and learn more about the Simonds before buying any other make? Really he who uses this saw profits much more by it than do we in selling it. You have more to gain than we.

An attractive little booklet fully describing these saws can be obtained by addressing our nearest office.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For Manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 30 Toronto, May 1, 1910 No. 9

Ontario's New Regulations

The decision of the Ontario Government to increase stumpage dues and ground rents in connection with the old timber limit licenses and the transfer fees for all timber limit transactions, and also to make the license owners pay for the entire maintenance of the fire ranging system, has been received with general dissatisfaction by the owners of timber limits in Ontario. Briefly, the effect of the new arrangements will be to impair the fire ranging system, to encourage license owners to get out all their timber as fast as they can, to reduce the actual cash value of licenses and to place a tax of some $300,000 a year upon the lumber industry of the province.

It was to be expected that such a measure would meet with disapproval on the part of Ontario lumbermen. There are some features of the new regulations, however, which will be met with disapproval not only by the lumbermen of the province but by the public in general. From the point of view of the public the most serious feature of the new situation is the change which will be brought about in the fire ranging system. The owners of licenses are in future to bear the cost of fire ranging instead of sharing it with the Government. When the Government paid half of the expense of fire ranging it was considered that the system could be developed into an ideal one. Now that the Government has placed the burden entirely upon the license owners, the situation is reversed. The Government own large quantities of timber adjacent to limits which are under licenses and are to that extent concerned in the prevention of forest fires. Not only are the public interested in seeing that this timber is properly protected, but they have a considerable interest in the timber upon limits which are under license. Every timber limit which is being worked gives employment to hundreds of men, and the mills which are supplied with raw material from the limits are the mainstay of numbers of thrifty and busy towns. The public therefore are closely concerned in the proper protection of these limits against forest fires.

The destruction of Government-owned timber involves a loss only of the actual timber destroyed. When a timber limit which is being operated is devastated by fire, the disturbance to trade and the loss of employment is almost as serious as the loss of the timber itself. The Government have a direct duty to the public to see that timber both on licensed and unlicensed land is protected according to the most effective methods. No one for a moment will claim that by throwing the whole cost of fire ranging upon the owners of the limits, the Government are doing their whole duty to the public. They are, of course, saving for the public the money which formerly they would have spent in paying for their half of the cost of fire ranging, but they are placing an unjust tax upon the owners of the licenses and to that extent encouraging ill-feeling which is certain to be reflected in some cases in a decreased interest on the part of the license owners in the effectiveness of the ranging system. If the Government were not concerned in the prevention of forest fires, and the only parties interested were the license owners, the situation would be very different, but the license owners have every reason to complain when they are compelled to shoulder a burden which does not properly belong to them. With the example of the Government before them, the license owners may be excused, if they, too, exhibit less interest in the fire ranging system than they have in the past.

One would have expected at least that the supervising fire rangers, whom the Government are to appoint to see that the others do their work properly, would have been maintained by the Government; so that their services might be considered absolutely disinterestd. However, even this is not to be, and the license owners have to pay for the maintenance of these supervisors.

As to the increase in the stumpage dues on the old licenses, the effect of the change can be definitely gauged. With an increase of 25 cents and 50 cents a thousand feet in the stumpage dues, the owners will be just that much poorer on every thousand feet of lumber which they market. The activity of competition will prevent them from passing along this tax to the consumer, and the effect of this increase will therefore be reflected upon the value of the limits. The limits will be rendered just that much less valuable to those who purchased them years ago, in the firm belief that they were purchasing an equity in the lumber, the value of which they could depend upon. In this belief they have conducted their operations and have invested much money in plants. Large sums have been borrowed from the banks on the strength of these licenses. When the lumberman goes to the bank now for a renewal of a loan, or to secure a fresh loan upon his timber properties, the first question which the bank will ask will be as to the value of the license now that the dues and rents have been increased. The answer will be less satisfactory to both parties. In brief, there will be just that much less of valuable property for the banks to invest their money in, and the licensees will be that much poorer. Those who have been dependent upon the lumber industry for employment will be injured by the diversion of capital to other industries.

The Government have pledged themselves not to increase the dues and rents again for a period of ten years. This is done as an encouragement to the lumbermen and will probably be used as an argument to demonstrate the good faith of the Government. Ten years, however, is a short period in the life of any industry, and the effect of this respite will not be very advantageous to the owners of licenses. Having already been deteriorated in value by the increased taxes, the licenses will still further deteriorate as the ten-year limit approaches its conclusion. By way of justifying themselves, the Government argue that upon these old licenses the unearned increment resulting from the increased value of timber has been so great as to bring much wealth to their owners. It may be that those who have held limits for speculative purposes have turned them over at good profits, but it is just as certain that those who have operated on their limits systematically and continuously have not secured any unearned increment great enough to warrant the Government in its latest move. During the last three years, in fact, any unearned increments that had accrued in previous years were probably wiped out of existence by the losses which lumbermen sustained when forced to carry on their business throughout a period of commercial depression. The lumber business is notoriously one of ups

and downs. The periods of low prices come with great regularity and counteract the profits which are to be made during the prosperous years. Even when business is extremely active, the lumbermen of Ontario are subjected to such keen competition from other lumber producing districts, notably the Southern States, than the fabulous profits which some people imagine them to secure do not exist. If the Dominion Government protected the lumbermen of Canada against foreign competition there might be some reason for thinking that the lumber industry provided large profits, but the lumber industry is attacked on both sides. For the sake of the consumer, protection is refused, and for the sake of Government, taxation is imposed. In both instances the Governments have gone to the extreme.

The general belief among lumbermen is that the new regulations will encourage rapid cutting of the timber and will discourage any tendency towards conservation. The licensees will not relish paying $5 a mile in taxes for the privilege of holding the limits until the young trees have reached maturity. The Government need not be surprised if they cut off all merchantable timber as rapidly as possible and allow the license to revert to the Crown. This is probably something which the Government has in mind, and, of course, being supreme, they are permitted to adopt such measures if they see fit. The public, however, will reasonably look upon such a course as one of confiscation and will question the justice of such a method of dealing with men who in the past have shown an intelligent interest in the preservation of their limits.

Quebec Lumbermen Pleased With Prohibition of Export

The announcement by Premier Gouin, of Quebec, that in future the exportation of pulpwood cut from Crown lands of the province would be prohibited, has met with a very general approval among the lumbermen of Quebec. The example provided by the case of Ontario, which took a similar step in connection with the exportation of sawlogs in 1897, justifies the course now adopted by Quebec. It is to be hoped that the result will be the adoption of a definite policy of protection of the forest resources of the province from reckless exploitation in the interests of the consumers of a foreign country. If properly cared for, the forest resources of Quebec will provide a perpetual supply of pulpwood sufficient to furnish paper not only for the province itself, but for many outside markets. Undoubtedly history will repeat itself in Quebec and we shall see in the near future the establishment of large paper mills in various parts of the province, to turn into finished product the raw material which until now has been shipped to the paper mills of the United States.

The increase of 60 per cent. in the stumpage dues and the addition of $2 a mile to the ground rent, making it $5 a mile, which have been announced in connection with the prohibition of export, are expected to bring to the province an additional annual revenue of at least $750,000. This feature of the regulations has not been received with any more approval in Quebec than the similar action which was taken at almost the same time by the Ontario Government. Lumbermen throughout the provinces of Quebec and Ontario have good reason to claim that the increase of the Government charges to cut timber is uncalled for. Profits in the lumber business have been continually growing smaller as a result of keener competition and the rapidly increased cost of manufacture. During the last two or three years no profits have been possible to lumbermen, and if the Government believed that they were not securing sufficient revenue from their forest resources they should have delayed for a time, until the industry had recovered sufficiently from the recent depression.

With the prohibition of the export of pulpwood, however, lumbermen may find their industry so greatly benefited that they will overlook the increase in the stumpage dues and ground rents. If the business develops in anything like the proportion that the lumber industry in Ontario did after the passage of a similar regulation in 1897, the lumbermen of Quebec have a period of unexampled activity to look forward to.

Legislation prohibiting the export of pulpwood was not only necessary but imperative, if the industry was to be saved from extinction. United States paper mills have been for years the only industry to secure the benefit of Quebec's pulpwood. Naturally, the people who are interested in United States mills are now confusing the issue with their own political affairs. Papar manufacturers of the United States are accused of having contributed to the present situation by clamoring for a high protective duty upon paper, and for free import of pulpwood. It is argued along the same line that the prohibition of the export of pulpwood by Quebec, is an act of discrimination against the United States which would justify the impcsition of the maximum tariff, if it were not for the fact that the Governments of both countries are now considering the feasibility of introducing a measure of reciprocal trade relations, which will perhaps include a settlement of the pulpwood question.

The people of the United States are drawing the wool over their own eyes in connection with this matter. If the action of Quebec in prohibiting the export of pulpwood were in reality an act of unneighborliness and not one of self-protection, there might be reason for complaint on the part of the United States, but there is no question that the people of Quebec are adopting the only reasonable course for the preservation of their natural resources, and that, irrespective of any question of mutual good-will, it is imperative that this prohibition be continued even at the expense of the paper making and publishing industries of the United States. The interests of the people of Quebec are paramount in the preservation of their own resources, and those who finally have to deal with the matter in the United States should be easily convinced of this.

That the action of Quebec was not influenced one way or the other by the tariff question is illustrated by the public utterances of Premier Gouin and several others of his Government, who stated long ago that the present action would be taken before September, 1910. Premier Gouin, in making his announcement regarding the matter in the Legislature, shed further light upon the situation by saying that the reason for his delay in making an announcement upon the subject was that he wished to avoid any interference with the tariff negotiations which have only recently been concluded.

Canadian Exporters Criticized by South African Merchants

The Canadian Trade Commissioner at Durban, South Africa, in his latest report to the Department of Trade and Commerce, remarks upon the continuing improvement in South African trade. He takes occasion at the same time to emphasize the number of serious criticisms which he has heard from South African merchants regarding the business methods of Canadian shippers of lumber. Many Canadian firms, he says, apparently think the South African market of no importance. At least, this is assumed to be the case "in looking for a reason for the slipshod, unbusinesslike methods of some who have been apparently endeavoring to form connections. Either this, or the alternative is that they are satisfied to remain in the most crass ignorance of the rudiments of the export trade."

Dealing with the subject of shipments of lumber, the Trade Commissioner, Mr. H. R. Poussette, says:

"On a recent trip to the Transvaal, constant complaints were heard directed against the methods of Canadian exporters and the quality of the goods shipped. Some of the timber merchants were most indignant at the treatment meted out to them, and stated that there is the greatest difficulty in obtaining timber up to specification. If conversations with some of the leading merchants of South Africa are to be taken as a criterion, it has to be regretfully concluded that the reputation of Canadian lumber exporters here is anything but savoury. Dealings with Sweden, on the other hand, appeared to be much more satisfactory, and there seemed to be little trouble in procuring the material as ordered. Although they refrained from so expressing it, it simply meant that the practices of the Swedes were considered more honest than those of the Canadians. Certainly no one will contend that to send out lumber below the specification charged for, and with an inspector's note attached, is right.

"One large firm stated that they had recently imported a shipment

of lumber from an Ontario firm. As it was intended for a large government building, in which only good material was being used, they specified the best, and paid from $72.50 to $80 per 1,000 feet. However, when forwarded to the building contractors, much of it was rejected as being scaley. To verify his statements, his partner who was discussing the subject, showed me the correspondence. He said that if he could be recommended to a reliable exporter he would place a trial order at once, and, if this arrived satisfactorily, would follow with large ones. He also mentioned that they paid cash in New York, and neither asked nor wanted credit. It can be accepted as a fact that there is plenty of cash business awaiting reliable Canadian lumber exporters here.

"Another firm, when interviewed, made the statement that they were highly pleased with a shipment of planks recently received from another Ontario shipper, and intended cabling over to repeat the order. A few days later, however, in answer to a request from this office for permission to hand the name of this shipper to the importers mentioned above, they replied by an invitation to come over and inspect the lumber. On going through the shipment more carefully and putting it through the sawmill before sending the cable, much of it was discovered to be poor 'shakey clear' instead of 'carpenter's clear,' a fact easily patent even to a novice. It is needless to say no repeat order was despatched."

The mines of the Rand use large quantities of lumber and Mr. Poussette suggests that a firm of Canadian shippers who would send out a thoroughly capable representative would, if they could compete with the United States shippers and could guarantee their material, easily recoup themselves through the resulting business. If a round trip were taken on one of the Canada-Cape steamers there would be ample time to interview importers in Cape Town, Durban, Johannesburg and Delagoa Bay. A large trade is done also in pine doors and it is suggested that a traveller should carry a miniature sample or bring a number of doors with him. If samples were guaranteed, substantial orders could be secured at once. There are also excellent prospects for trade in hammer handles and a number of inquiries have been received for maple flooring. The latter class of business has a good prospect for developing extensively. Inquiries are being made by furniture manufacturers for walnut, poplar, birch and other furniture woods. This industry is just commencing to assume importance and Canadian exporters might form profitable and lasting connections.

The Trade Commissioner service is performing a most useful office in bringing matters of this nature to the attention of Canadian manufacturers. Such complaints as those referred to above should be enquired into carefully and the danger involved to a prospective lucrative trade eliminated without delay. Canadian lumber has an excellent name in Great Britain and should without difficulty obtain the same reputation in South Africa.

Editorial Short Lengths for Busy Readers

At the recent meeting of the Mountain Lumbermen's Association at Nelson, B.C., one of the most important questions discussed was that of grading. No one question is of greater importance to the trade to-day. Realizing this, a definite and commendable step was taken in adopting the grading rules in use in the Mississippi valley, on the better classes of pine lumber.

It has been reported from Washington that the United States Government will attempt to open negotiations with the Quebec Government on the question of the prohibition of the export of pulpwood. Premier Gouin on hearing the report declared that the province would not change its stand. "If they want to negotiate with us," said the Premier, "of course we cannot refuse. We are willing to meet representatives of the United States Government, but I can say that the province will not change its attitude in the slightest. We have decided on the policy after thoroughly considering the question, and will not consent to alter our programme in any particular."

"The conditions are better now than when we were in Seattle (a year ago)," said Mr. Edward Hines, president of the National Lumber Manufacturers' Association, in his address at the annual meeting held on April 19th and 20th at New Orleans. "We have not quite reached the end of the bitter tariff campaign then; now, we know the worst, and that worst is not quite as bad as we feared. Then, we were in the depths of a business depression; now the country is at least across the threshold of a new era of prosperity, though the lumber industry is lagging somewhat behind the rest. Then the business sky was overcast, though the clouds were breaking a little; now the sun is shining clear."

Referring to the prohibition of the export of pulpwood from the Province of Quebec, the "American Lumberman" in the course of an editorial says: "The situation has one particularly bright feature. In the event that all the eastern provinces place an embargo on the exportation of pulpwood, the paper manufacturing industry of the United States will receive a tremendous impetus. Woods not now considered available for the manufacture of paper will be tested and, as an outcome of the investigations made, many kinds of material and much of the mill refuse, which is now burned, probably will be rescued and made into pulp. With pulpwood commanding a high price, the question of the disposition of the low grade material, in so far as wood suitable for paper is concerned, will have been solved."

It is wonderful to what extremes ignorance of actual conditions will lead some people in argument. Take, for instance, the matter of the tariff troubles between Canada and the United States. The "Southern Lumberman" in a recent article, the object of which was to take a round out of President Taft, said: "It will be conspicuously seen that lumber, of which our exports to Canada have been amounting to something over four millions per annum, is not to go at the intermediate rates. On our lumber we pay Canada's maximum rate. On the other hand, imports from Canada which are to receive the lowest of our rates include nearly sixteen million dollars worth of lumber, four and a half million dollars worth of pulpwood, three and a half million dollars worth of wood pulp, two and a half million dollars worth of shingles, one and a half million dollars worth of timber and several other articles related to the lumber business, and amounting to several million dollars." "The brutal truth of the matter," to use the "Southern Lumberman's" own phrase, is that whoever wrote this article did not know what he was talking about. Lumber coming into Canada from the United States does not pay Canada's maximum rate of ruty. It comes in free. Canadian lumber going into the United States pays a duty of $1.25 per thousand feet, which, though lower than the duty in force previous to the recent change in the tariff, is a very heavy tax upon Canadian lumber when seeking to enter United States markets. United States lumber coming into Canada, by reason of the absence of duty, is able in many cases to play havoc with Canadian markets. So, after all, the shoe is on the other foot and President Taft may not be so black as he is painted.

That the alarmist views expressed by Mr. J. J. Hill regarding the danger of a car shortage during the coming autumn were greatly exaggerated, is borne out by the opinion of a number of freight and transportation officers both of the Grand Trunk and the C.P.R. Interviews with a number of these officers indicate that even if Mr. Hill's deductions were true for the United States they would not apply to Canada. It is admitted on all hands that the traffic movement is steadily increasing and that with a big harvest in 1910, it is not unlikely that the railway companies of Canada will be severely taxed to meet the situation. They do not expect, however, to have to deal with anything like a car famine. The C.P.R. and the Grand Trunk are steadily adding to their rolling stock, increasing their mileage and improving their transportation facilities generally. An indication of the efforts that are being made in this direction is afforded by the speed with which the C.P.R. is securing new cars. They are being turned out now at the rate of fifteen per day, and the company have recently given an order for $1,000,000 worth of cars, to the Dominion Foundry Company. Both these orders are to be completed so that the cars will be available for this year's harvest.

Quebec's New Timber Limit Regulations

Details of the Amended Rules Regarding Manufacture of Timber Cut from Crown Lands—Stumpage Charges which will be in Effect After September 1, 1910.

The following is a summary of the regulations recently passed by the Government of Quebec in regard to the leasing of Crown timber lands:

1. Licenses to cut timber are subject to an annual ground rent of $5 per square mile after September 1, 1910, and are to run for 12 months from the 1st of May.

2. Licensees may renew their licenses any time between April 30 and September 1, if they have conformed with the existing regulations.

3. If a limit is destroyed or injured by fire it may be annulled by the Minister.

4. Transfers must be made in writing and are subject to the acceptation of the Minister and the payment of a transfer bonus of $4 per square mile. No transfer can be made if the licensee is indebted to the Crown.

5. A licensee may make a conditional transfer as guarantee of the repayment of advances, without paying any bonus, provided he has settled in full all arrears to the Crown.

6. Crown timber agents are to keep a register of all licenses issued for their agency and all transfers made, to which the public will have free access.

7. Licensees must inform the department before December 1 of their operations for the current season. Licensees are to furnish the Government with a sworn statement of all timber cut during the preceding logging season; sworn statements of the quantity, description and origin of all timber cut; sworn specifications by cullers of said timber; an affidavit by the licensee or his representatives corroborating the sworn statement of his employees; and a sworn statement of his limits not worked. These statements are to be furnished by June 30 each year, or in cases where waters flow into the Gulf of St. Lawrence, into the ocean, or traverse other provinces or adjoining states, the information is to be furnished before the drive.

8. Cullers must measure all timber cut and make detailed reports of each measurement, leaving a copy at each camp. Licensees must report all timber cut and not hauled. Stumpage dues are to be levied on all stumps of more than two feet above the ground, and all timber of more than six inches left in the tops; of all lodged trees; of all trees used for skids or for the building of shanties, and of all logs left in the woods.

9. Bush rangers and other officers authorized by the Minister to superintend lumbering operations must be facilitated in their work.

10. Licensees must produce a specification or statement from the Supervisor of Cullers at Quebec or by other accepted method of measurement, showing accurately the quantities of square and waney timber for exportation. Otherwise each piece will be considered as containing 50 cubic feet.

11. Before the removal of wood from the agency the owner must report to the local Crown timber agent, and, if required, declare under oath the quantity of each description of timber intended for transport, its destination, etc., in order to exempt from Crown dues the timber procured from private lands.

12 Licensees are forbidden to cut on Crown lands white or red pine measuring less than 13 inches, spruce, hemlock, cedar, maple, birch and other trees of less than 8 inches diameter at the stump measured two feet above the ground.

13. All timber cut on Crown lands after May 31, 1910, must be manufactured in Canada, that is to say, converted into pulp or paper, into deals or boards, or into any article of commerce or merchandise as distinguished from timber in its raw or unmanufactured state. Timber shall not be considered as "manufactured" when merely cut into lengths or logs piled up, barked or otherwise worked preliminary to the fabrication of pulp or paper, of deals or boards, or of any other articles of commerce; nor waney timber, nor poles, but actual square timber and railway ties will be considered as manufactured. Any time that, on satisfactory information, supported by an affidavit, the Minister or authorized officer have reason to believe that timber cut in virtue of a license on public lands is not to be manufactured in Canada, in whole or in part, this timber may be seized and placed under custody by any agent of the department. When timber has been so seized the interested parties must give two good and sufficient securities that the timber will be manufactured in Canada. If the securities are not given within two months the timber shall be sold at public auction after a notice of at least 15 days. The purchaser at such a sale will be required to manufacture the timber in Canada and the proceeds of the sale will be handed over to the person entitled to the same after a deduction of the cost of seizure and cost of sale and any sum due to the Crown by the license holder. After seizure the burden of proving that the timber is to be manufactured in Canada lies on the owner.

14. In the measurement of timber for sawing, the timber shall be reduced to the inch board measure according to the Quebec table. Logs 18 feet long and less shall be measured at the small end, the diameter of the same being taken. Logs over 18 feet in length shall be measured as follows, viz.: by adding the diameter of the butt and top together and dividing the product by two, which shall be considered the mean diameter. For the purpose of measurement a fraction of three-quarters and more is considered as a whole, but a lesser fraction is not considered. Failing special measurement for long timber, the said timber will be charged two cents per lineal foot for spruce, hemlock, balsam, cypress, cedar, silver birch and poplar, and four cents per lineal foot on all other descriptions of timber.

15. All wood goods cut in virtue of a license after the 1st of September, 1910, are subject to the following charges:

(1)	Square or waney timber, per cubic foot:	
	a. White pine, oak, hickory, walnut	$ .06
	b. Red pine, elm, ash, cedar, basswood, birch, maple, tamarac	.05
	c. Spruce, balsam, grey pine or cypress, hemlock, white birch, aspen poplar	.03
(2)	Saw logs and boom and dimension timber in the raw state, per thousand feet board measure:	
	a. White pine, oak, walnut, hickory	2.00
	b. Red pine, elm, ash, cedar, basswood, birch, maple, tamarac	1.40
	c. Spruce balsam, grey pine or cypress, hemlock, white birch, aspen poplar	1.05
(3)	Firewood per cord of 128 cubic feet:	
	a. Hardwood	.20
	b. Soft wood	.10
(4)	Rails not exceeding 12 feet in length, per 100:	
	a. Cedar rails	.30
	b. Rail of other varieties of lumber	.15
(5)	Pickets, per 100:	
	a. Cedar pickets	.15
	b. Pickets of other varieties of timber	.10
(6)	Poles of more than 18 ft. in length, not exceeding 10 inches in diameter at the small end, each:	
	a. Thirty feet and less in length	.15
	b. Thirty-one to forty feet in length	.25
	c. Forty-one to fifty feet in length	.50
	d. Fifty-one and over in length	1.00
(7)	Shingles, per thousand	.25
(8)	Railway ties or sleepers not exceeding 9 ft. in length, each	.05
(9)	Hemlock bark, per cord of 128 cubic feet	.60
(10)	Knees, curves, futtocks and other shipbuilding material and all wood goods not enumerated in foregoing list, ad valorem per cent.	15

The English cord of 128 cubic feet is taken as an equivalent to 600 feet board measure for rough or unbarked wood, and 700 feet b.m. for rossed or peeled wood.

16. The present rate of ground rent for licenses to cut timber shall not be increased until the 1st of September, 1910, and all license holders who have conformed and shall conform to the laws and regulations on Crown lands, shall have, up to that date, the privilege of renewing their licenses at the same rate of ground rent; and the dues now exacted by the regulations shall not be increased before the said date of 1st of September, 1910, but the rate of ground rent may at all times be increased for the license holders who do not operate their limits, the Crown reserving the right to determine the quantity of timber which must be cut to constitute a sufficient lumbering operation.

17. Interest is to be charged on stumpage remaining due and unpaid after November 30.

21. In the event of timber being cut in trespass in good faith on public lands, the Minister may effect a settlement.

23. All persons are forbidden, unless they have previously obtained special authorization from the Minister to settle, squat, or clear land, or cut any timber, on unsurveyed territory, or on surveyed territory not opened for sale, comprised within the boundaries of the province, and under license to cut timber; the said timber being the exclusive property of the license holders who have the right to prosecute any one violating this regulation.

The rest of the regulations referred to matters of surveys and forms of licenses, etc. The omitted sections are of minor importance.

The imports of lumber at Liverpool, Birkenhead and Garston during January, 1910 amounted to 450,730 cubic feet, an excess of 17,820 cubic feet compared with the imports in January, 1909

Railway Freight Argument Concluded

Companies Fight the Lumbermen to the Last Ditch—Decision of the Board Expected Soon—Practical Mileage Scale Presented by C.L.A. Secretary

Ottawa, April 20—What is assumed to be the last evidence the Railway Commission will require, to reach a decision in the long drawn out battle between the lumber interests of Canada on one side and the C.P.R. and G.T.R. on the other, was heard yesterday. The contest lasted all day, with Commissioners Scott and Mills presiding. The feature of the hearing was the new and unexpected tack of the railway companies. They adduced voluminous testimony to justify increases in lumber freight tariffs, while their defence at the last sitting was that no advance on the old rates was intended, the new schedule being merely to readjust rates and remove anomalies. The Canadian Lumbermen's Association, which is acting for the lumbermen, was prepared to meet the new line of defence, but asked for time to prepare a statement in rebuttal. The fact that the court ruled that the lumbermen's request was reasonable, and still did not grant an adjournment, is taken to mean that the new course of the railway companies will have no serious effect.

This fight of the lumbermen against the railway companies had its origin in a new tariff for lumber made effective on May 1st, 1908. The lumber companies filed an application against the rates on December 29th of the same year. The first hearing was on April 18th, 1909, when an adjournment was made to May 18th. Another adjournment delayed the trial till September 21st last. On that occasion Chief Commissioner Mabee came to the conclusion that the railways would collect some $49,000 more per year from the lumbermen than under the old rates. Up to that time the railways took the stand that the revised schedule did not contemplate increases. The whole affair was then referred to the parties concerned and the traffic officer of the Railway Commission, with instructions to draft a schedule of rates that would come within reasonable bound of the old one. Mr. Mabee said he would sanction a schedule that would not exceed the old one by more than $5,000 a year. At yesterday's sitting it was reported that the traffic officer, after a conference with the railway officers and lumbermen on February 15th, had failed to reach any tariff that would satisfy both parties.

One of the tables submitted by the railways to justify increases in rates set out comparative advances in lumber prices during the last 11 years. This, they asserted, showed diminishing railway freight rates in ratio to wholesale lumber prices. It was set out that the wholesale price of Canada white pine in 1899 was $10 per M; in 1901, $15; in 1906, $20; in 1910, $24. The price for Canada spruce during the same years was given at $9, $12, $14 and $15 respectively. Hemlock prices were a dollar less than spruce. The freight rates per 100 pounds (a) from Midland to Toronto were 7½ cents till 1910, when they increased to 8 cents; (b) from Penetang to Montreal, 10 cents till 1910, when they increased to 12½ cents. The strong point sought to be made by the railways was that the percentage of freight rate to prices on Midland-Toronto shipments in 1899 was 20.2 per cent. for white pine, 25 per cent. for Canada spruce, and 28 per cent. for Canada hemlock, while these percentages had dropped in 1910 to 9 per cent., 16 per cent., and 17 per cent. respectively. On shipments from Penetang to Montreal the percentage of freight charges to value of lumber was in 1899, for white pine, 27 per cent., and at present only 14 per cent. Spruce dropped from 33 per cent. to 25 per cent. according to the same table. Mr. G. F. Shepley, K.C., arguing for the railways, dwelt on the proportion shown by these statements which were vouched for by the purchasing agents of the railway companies. He contended that the railway companies strong reasons for adding to the tariffs when the cost of so many other commodities as well as lumber, such as labor, rolling stock, etc., were considered.

The answer of the lumber association to the table of proportionate charges was that it did not cost any more to carry a load of lumber when it was worth $24 than when it was worth only $10. The increases in wages, cost of living, etc., were causes for the higher price of lumber. As to the cost of rolling stock, Mr. J. F. Orde, K.C., who appeared for the lumbermen, argued that the improvement in the quality of rolling stock would account for the increased cost. The railways continued to pay large dividends, so that their earnings should have increased just as rapidly as the increased cost of commodities and the cost of living. Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, refuted the railways' contention as to increased cost of operation, with statistics from the Dominion Government report. They show that the cost of operation by the Canadian railways in 1909, the last year given, was around 70 per cent., or the same as the average for the last 35 years.

A striking retort was drawn from Mr. Hawkins by an interruption of Mr. Shepley. The lumbermen's secretary remarked that the railway companies. He contended that the railway companies had strong reawhen the land grants were computed at 50 cents an acre. He intimated that the lumbermen of the country contributed a big portion of this great national subsidy to the railway companies.

"And what did the lumbermen get?" asked Mr. Shepley.

"Here's what we get," responded Mr. Hawkins, and he started to read from a daily newspaper the announcement of the Ontario Government's decision to increase the lumber dues from $1 to $1.50 per M. ground rent from $3 to $5 per acre, etc. The latter part of his reply was lost in the noisy merriment the sally created.

The outstanding argument for the lumbermen was contained in a mileage scale presented by Mr. Hawkins. It was a schedule of suggested charges based on the Dominion Government statistical report on the average rate per ton per mile on all commdoities. This average rate is .727 cents per mile, and the average haul 197 miles, taking the returns for 1909. The graded scale prepared for the lumbermen's case showed that for a haul of 175 miles at 5 cents per 100 pounds the rate per ton per mile would be .571 cents. This is only half a cent less than the average rate in the Government report. In order to demonstrate the unfairness of the new schedule of the railways, the Lumbermen's Association submitted suggested rates for seven specified hauls up to a maximum of 175 miles, which produces the exact average of .727—the Government figure. In every instance the new schedule of the railway companies is nearly double. The suggested scale shows a regular and consistent lowering of rates per mile as the mileage increases. It is interesting to note that as the long hauls are reached the rates of the lumbermen and the actual terms of the new schedule coincide. But the rates on long hauls are of little concern to the lumber industry on account of the insignificant amount of shipping over these distances.

Following is the table of the lumbermen:

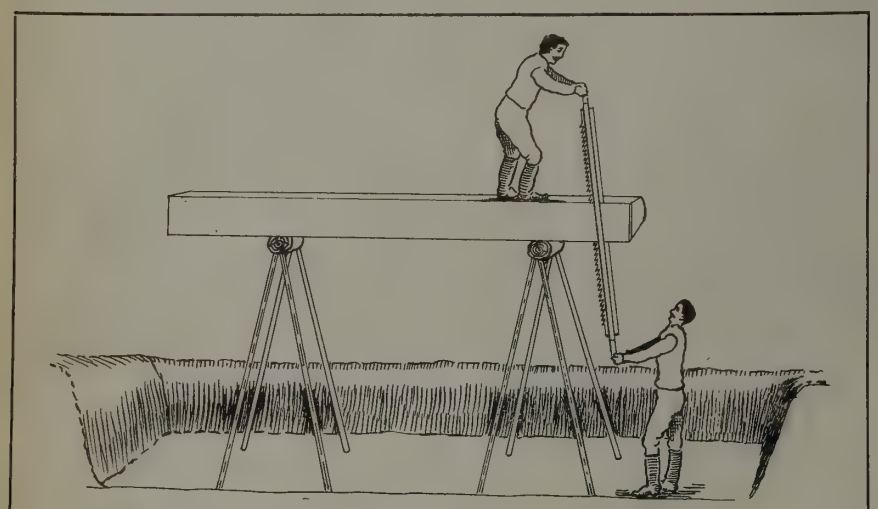
	Suggested mileage scale		Mileage scale on which present tariffs are claimed to have been based	
	Rate per 100 lbs.	Per ton Per mile	Rate per 100 lbs	Per ton Per mile
Up to 40 miles	2	1.000	5	2.500
41 to 60 miles	2½	.833	5½	1.833
61 to 80 miles	3	.750	6½	1.625
81 to 100 miles	3½	.700	7½	1.500
101 to 125 miles	4	.640	8	1.208
126 to 150 miles	4½	.600	8½	1.133
151 to 175 miles	5	.571	9	1.029
Average rate per ton per mile of above rate up to 175 miles		.727		1.547
176 to 200 miles	5½	.550	9½	.950
201 to 225 miles	6	.533	10	.888
226 to 250 miles	7	.560	10½	.840
251 to 275 miles	8	.585	11	.800
276 to 300 miles	9	.600	11½	.766
301 to 350 miles	10	.571	12	.686
351 to 400 miles	11	.550	12½	.625
401 to 450 miles	12	.533	13	.578
451 to 500 miles	13	.520	13½	.540
501 to 600 miles	15	.500	15	.500
600 miles and up	17	.486	17	.486

Comparison of the rates of the two columns shows that the application of the lumbermen for restoration of the old tariff was not unreasonable. The figures in the first column were not designed as a tariff, although they appear to fill the requirements of the lumbermen. As lumber is in the lowest classification and free from claims for losses, it is contended that when it compares so favorably with the Government figures the demands of the railways must be extortionate.

A comparison with the rates on cement was made. The lumbermen pointed out that the quantity of cement shipped was only one-sixth that of lumber and that the former produced many claims for damages.

At the end of the hearing it was announced that a ruling would be given on the evidence heard.

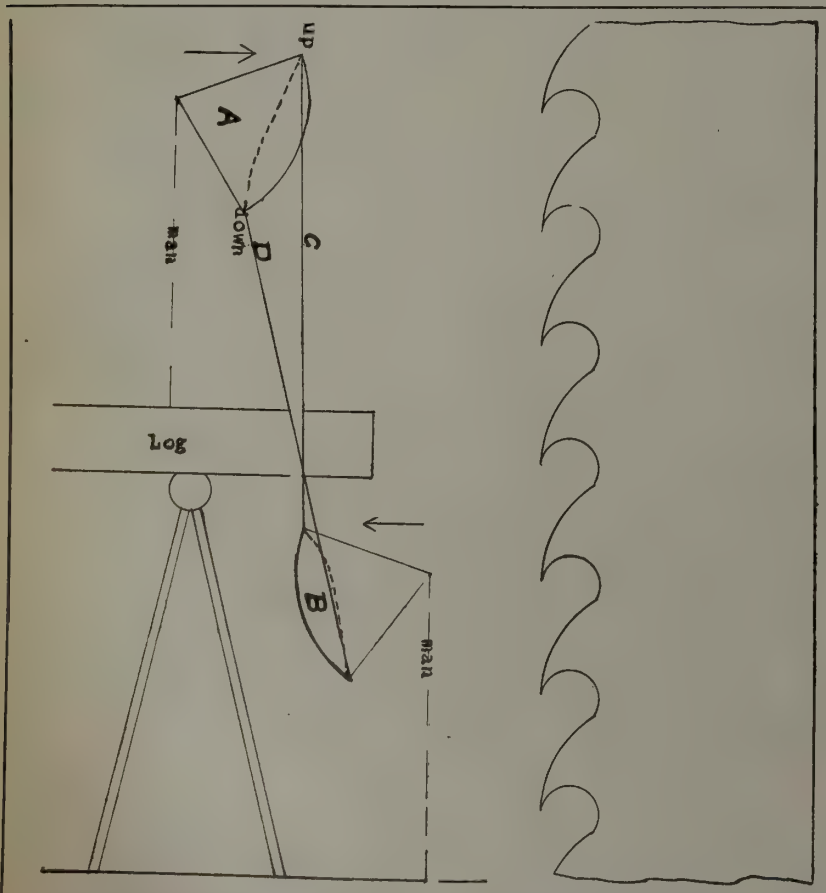
Those attending the final trial were: J. B. Miller, president of the Canadian Lumbermen's Association; J. C. Browne, vice-president; W. M. Ross, of J. R. Booth's firm; R. G. Cameron; E. R. Bremner, of Watson & Todd; J. E. Walsh and W. S. Tilston, representing the lumber interests, in addition to those already mentioned. W. H. Biggar, G.T.R.; E. W. Beatty, C.P.R.; John Pullen and C. A. Sayes were present for the railways.



The weekly report of the Canadian Department of Trade and Commerce contains the following addresses of dealers in wood goods at Bristol: Maple flooring, Heber, Denty, Limited; May & Hassell. Spruce deals, Jones and Wainwright; May & Hassell, Limited; Taylor & Low Bros.; Heber, Denty, Limited; G. H. Perrin & Company, Star Buildings; John Scadding & Sons, Eugene street, Pennywell road; Howes & Company, Western Wharf, Hotwell Road. White wood, Woodman & Sons.

The Evolution of Modern Saw Milling

Its Developement from the Primitive Pit-Saw which Turned Out 100 Board Feet in Twelve Hours—Discription of the Methods of Working a Pit Saw

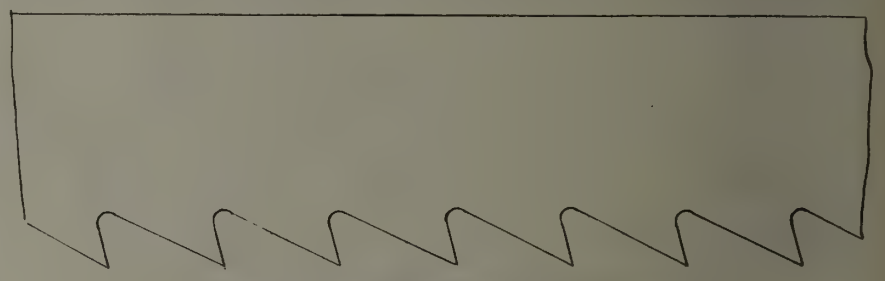


By I. N. Kendall

The start of the lumbering industry in Canada was on the north side of the St. Lawrence river, about 25 miles above Quebec City. French engineers located there, and commenced manufacturing lumber with pit saws. From this small beginning, of one saw operated by two men, able to make about 100 feet b.m. in 12 hours, has grown one of the greatest industries in the world. Compare this mode of making lumber with one of the modern saw mills, with concrete frame, and the modern band saw, with a speed of nearly two miles per minute, operated by only five men and cutting 50,000 feet in 10 hours, or in less time than it took to

1.—The First Canadian Saw Mill—The Pit Saw

cut 100 feet. If we watch the log from the time it is moved in the water to the jack chain, until the product is delivered in the storing yard, we shall find that very little manual labor is required, for live rolls and transfer chains and other labor saving devices do nearly all the hard work. But to bring all this about, required much thought, and a good deal of experimenting by the mill men. First came the pit saw; second,



2.—Diagram Showing Motion of Pit Saw. 3.—Proper Shape of Pit Saw Teeth

the English gate, with one saw; third, the muley saw; fourth, the circular saw; fifth, the gang of a number of saws, both straight line and oscillating, and last, the band saw, both single and double cutting. In the near future another great change will have occurred, when the power for driving the saws will be electricity.

I will take up the different subjects as enumerated above, the first being the pit saw. I enclose a few sketches, to make the meaning clearer. We have learned that the first pit saws used in Canada were made parallel, about 4 inches wide and 5 feet long. On account of their being so narrow they were hung in a frame made of wood. The frame was about 3 feet wide between the stiles and iron stirrups were attached to the girts or cross pieces at both ends to strain up the saw. The weight of the saw together with the frame and iron hangers made this contrivance very heavy. It would weight 25 or 30 pounds. Some might say that if it were even heavier it would be so much the better, for the extra weight would serve to help force the saw down through the cut. But we have found in practice, that the less weight we have, providing the teeth of the saw are made the proper shape and kept sharp, the better. I have found in a long experience that teeth shaped as in diagram No. 3 are the best for all kinds of timber, both hard and soft. We find many saws coming from the shop with teeth as in diagram No. 4. I never could make them do good work in any kind of timber.

In diagram No. 2 I have tried to show the proper motion a pit saw should have. We will start at the extreme upper limit of the stroke, and follow the dotted line on A, at the same time following the arc of circle on B to the down limit. Line C shows the edge of the saw commencing the down stroke, and line D shows the edge at the finish of the down stroke. In commencing the up stroke, A follows the arc of the circle and B follows the dotted line. The reason for A following the dotted line down is to shorten his arms and give more power to force the saw down. While the arms of B are at full length out, when the saw is down B follows the dotted line up, which shortens his arms and consequently gives

4.—Shape of Teeth Often Found on New Saws.

him more power to lift the saw up, while A follows the arc of the circle up. There are few men who will not learn to follow those lines in a short time.

I have cut a great quantity of lumber with pit saws, in places where it could not be procured otherwise. It is always necessary to have proper pit saw files, which are made for the purpose of fitting the saw in the shape as shown in diagram No. 3. They are called pit saw files, and can be procured at any good hardware store. The best pit saws I have used were made in Canada by Canadian manufacturers. They seem to know what the country requires.

The above article is the first of an interesting series which will be published in the "Canada Lumberman." The author, Mr. I. N. Kendall, of Ottawa, who has been a constant reader of the "Canada Lumberman and Woodworker" since the first copy was published, has acted in the capacity of superintendent millwright in all parts of Canada and in Newfoundland. For 54 years he has constructed and operated sawmills and has had experience in every branch of the lumber business from the stump to the market. Many of the machines in the modern mills are of his invention. He is therefore eminently capable of giving useful and practical information to readers of the "Canada Lumberman and Woodworker."

S. P. Musson, Son & Company, Barbados, report under date of April 9th as follows: Lumberstuffs—No arrivals have taken place during the fortnight, and stocks are being gradually reduced. White pine is not in heavy supply and a cargo or two would probably do well. Spruce—This class of lumber is in fairly good demand, owing to crop requirements, and as there are only light stocks in market, there is an opening for a couple of cargoes. Pitch pine—No arrivals, but we understand there is a cargo now on the way, which has been already contracted for. Shingles—Receipts consist of 70,000 Long Gaspe for which consignees obtained $4.93, and 150,000 cedar laying, imported by dealers for their own requirements. Shooks—No receipts. Wood hoops—No arrivals; stocks are ample for this season.

A Uniform Log Rule for all Canada

What Rules Could Best be Adopted?—Would the International Rule Suit?—Suggested Adoption of Cubic Foot Measurement—Interesting Discussion of Subject by A. H. D. Ross

Editor of the "Canada Lumberman",—I am very much interested in the suggestion of "Subscriber" that a uniform log rule should be adopted for the whole Dominion, and wish to say something regarding the matter that may be of interest to your readers.

Up to the present time, I find that no less than 54 different rules have been devised for the purpose of estimating the contents of logs of given diameters and lengths. Some 46 of these may be described as board measure rules, and the remaining 8 as volume rules. The board measure rules profess to give the number of "board feet" of inch lumber that may be sawn from logs of given dimensions, and the volume rules give a more or less accurate estimate of the cubic contents of the logs.

As milling operations extended into new regions and as improvements were made in the machinery used, it was found necessary to devise new rules to suit the changed conditions; hence the great number of rules in use in the different lumbering regions. Of the 46 board measure rules, 17 may be described as formula rules, 17 as diagram rules, 8 as mill tallies, and 4 as combination rules. What I have designated as formula rules include the International, Champlain, Universal, British Columbia, Preston, Baxter, Doyle, Ake, Square of Three-Quarters, Square of Two-Thirds, Cumberland River, Forty-five, Ropp, Vermont, Winder, Stilwell and Orange River Rules. A comparison of the formulae upon which these 17 rules are based brings out some very interesting regulations, but space forbids our going into the subject at this time.

To the diagram class belong the Scribner, Maine, Bangor, Parsons, Quebec, Spaulding, Favorite, Hanna, Drew, Baughmann Rotary Saw, Baughmann Band Saw, Derby, Partridge, Wilson, Finch and Apgar, Warner and the Younglove Rules.

The mill tally rules include the Carey, Chapin, Dusenberry, Saco River, Northwestern, Wilcox, Herring and Schenck. From the nature of the case, these rules have only a local value.

In the combination class we have such rules as the Doyle-Scribner, Doyle-Baxter, New Brunswick and Boynton. The first of these has been adopted by the National Hardwood Lumbermen's Association, because the hardwoods are generally very defective. It is a combination of the Doyle figures up to 28 inches and the Scribner figures above that diameter The New Brunswick rule is a combination of the Vermont figures from 11 to 18 inches and the Maine figures from 19 to 24 inches, but is too limited in its range to be of much practical value.

The volume rules include four "standard" rules: the Ohio River Cube, the Constantine, the Ballon and the New Hampshire. The Nineteen-inch Standard, or "Market" is equivalent to the volume of a log whose middle diameter is 19 inches and whose length is 13 feet. As the volumes of logs of other dimensions vary as the squares of their diameters and directly as their lengths, it therefore follows that if D is the diameter of the log in inches and L is its length in feet, it will contain $D/19 \times D/19 \times L/13$ Standards, or "Markets." In the case of the Twenty-one Inch Standard, the standard diameter and length are 21 inches and 13 feet; in the Twenty-two Inch, 22 inches and 12 feet; and in the Twenty-four, 24 inches and 12 feet.

With such a welter of rules—many of which are grossly inaccurate and no two of which agree—is it any wonder that there is a widespread desire for the adoption of a universal standard of measurement?

Factors that Should be Considered

In the framing of a board measure rule, the following factors should be taken into account: (1) An accurate knowledge of the volume of wood inside the bark; (2) The percentage of the wood that will be converted into sawdust by the sawing of the log into inch boards; (3) The amount of waste in slabs and edgings; (4) The minimum width, or minimum board measure, of the boards to be included; (5) The effect of the taper of the logs upon the amount of lumber that can be sawn out; (6) The effect of normal crook in diminishing the amount of lumber that can be obtained from perfectly straight logs. In all cases, we presuppose the use of good machinery, the employment of skilful sawyers, and that the logs are sound. Discounts for such defects as "butt-rot," "ring-shake," "gum-seams," etc., must necessarily depend upon the experience and judgment of the scaler.

The saw kerf waste is always some fraction of the area of the end of the log, and consequently increases as the square of its diameter. Some of the first saws in use cut a kerf of almost half an inch and consequently wasted 33 per cent. of the wood in separating the log into inch boards. Simple arithmetical calculations show that the percentage waste for saws of given kerfs is as shown in the following table:

Saw kerf	1-2	7-16	3-8	5-16	1-4	3-16	5-32	1-8	7-64	3-32
Percentage waste	33	30	27	24	20	16	13	11	10	8.6

From these figures it will be seen what a saving may be effected by the use of thin saws. The deduction necessary for the square-edging of the boards is found to be almost proportional to the bark surface of the log, and therefore increases directly as its diameter. Curiously enough, the only rules which provide for the edging allowance in a rational way are the International, Champlain, Universal, British Columbia, Baxter and Preston. In the International it is computed from the circumference of the log at its middle point; in the Champlain and Universal from the circumference at the small end; and in the British Columbia, Baxter and Preston at certain depths beneath the bark. The most peculiar thing about the whole business, however, is that the International is the only rule which properly takes care of the allowances which should be made for the taper of the logs, and the normal crook found in nearly all classes of timber. It assumes that in 12-foot logs the taper averages 1½ inches, and that the average major crook is also 1½ inches. The saw kerf allowance for this rule is one-eighth of an inch, with a safety factor of 1/16 of an inch for uneven sawing and the shrinkage of the boards in drying. This makes the volume of the untrimmed boards 16/19 of $.7854\ D^2 \times L/12 = .6613\ D^2 \times L/12$. When $L = 12$ feet, this formula becomes $.6613\ D^2$; or for each four-foot section, $.22D^2$. The amount of the surface waste was calculated geometrically, checked by means of diagrams, and tested at the mills. The result showed that it amounted to 2.12 D for 12-foot logs, or .71D for each four-foot section. The extra short boards had to be at least 3 inches in width or contain at least two board feet. The formula for each four-foot length is $.22D^2 - .71D$, and the rule has been computed for logs varying from 8 to 20 feet in length, and for diameters varying from 3 to 60 inches. To effect a saving in the clerical work of computing tallies, the figures were then rounded off to the nearest multiple of 5—the error being compensating where a considerable number of logs is measured. Being the only log rule which takes into account the factors that influence the amount of lumber that can be produced from normally straight and sound logs, I have not the slightest hesitation in championing the cause of the International. I do not hold a brief for the author, of the rule, but judge it simply on its merits. A test of it was made in one of the mills in the Ottawa valley and showed that the rule is an exceedingly accurate one. The theoretical scale of 402 white and red pine logs of average quality, measured as they came to the saw carriage, was 82,920 board feet. The sawyer was reckoned by his employers to be a good man, but not the best in their employ, and the actual product in square-edged boards was 83,288 board feet—thus over-running the scale by 4/10 of one per cent. Some 245 of the logs were from 6 to 20 inches in diameter and 157 of them from 21 to 33 inches. For the sake of comparing this rule with the Champlain, Scribner and Doyle rules, the diameters between 6 and 17 inches are overlapped in the following table.

Diameters of small ends of logs.	Number of logs tested	Percentage over-run of saw-cut as compared with the scale by International	Champlain	Scribner	Doyle
6- 8 inches	28	2.6	10.3	33	143
7- 9 inches	54	2.3	8.8	35	115
8-12 inches	101	0.0	7.1	34	72
10-17 inches	104	—1.1	4.7	23	45
18-20 inches	90	0.5	6.7	14	24
21-24 inches	126	1.1	5.2	14	18
25-33 inches	31	—0.5	3.3	9	10

These figures show that the Scribner and Doyle rules are not at all suitable for small logs; and the logs are becoming smaller and smaller all the time in Canada, as most mill men know to their cost.

Another point in favor of the International rule is that, being based upon a correct mathematical formula, it can be modified to meet the case of saws with a different kerf from that upon which the rule was built up. In this connection, I recall an amusing instance of a friend of mine who made a most elaborate calculation to prove that the kerf of the saws has nothing to do with the amount of the surface waste. A little reflection would have shown him that the width of the edged boards depends entirely upon the distance between the saws and is quite independent of the width of the track they cut. If the kerf of the saws which separate the log into inch boards is ⅛ of an inch and the scale is 1,000 feet board measure; then, with saws cutting a kerf of 7/64 inches it will be 1,013 feet; for 3/16 inch, 950 feet; for ¼ inch, 905; for 5/16 inch, 864; for ⅜ inch, 826; and for 7/16 inches, 792 feet. The Champlain and Universal are the only other rules which can be modified to meet cases of this kind, but, unfortunately, neither of them takes into account either the taper or the crook of the logs. The Doyle, Square of Three-Quarters, Square

of Two-Thirds, Ake, Cumberland River and other formula rules are based upon formulae which are purely arbitrary. The Doyle rule, in particular, may be defined as a regular mathematical monstrosity! Its formula is $(D-4)^2 \times \frac{3}{4} \times L/12$; which may be written in the form $(D-4)^2 \times L/16$. In the case of 16-foot logs this becomes $(D-4)^2$. If we now take the case of a 4-inch log the scale would be 0, which is manifestly absurd. The following table compares the Doyle scale for 16-foot logs with the actual scale and the Scribner, Quebec, Champlain and International scales, and proves rather conclusively the unsuitability of the Doyle rule for the smaller sizes of timber:

Diameter of 16-foot logs	Doyle scale	Actual scale	Scribner scale	Quebec scale	Champlain scale	Intern'l scale
4 inches	0	6	7	12	8	5
5 inches	1	12	13	15	14	15
6 inches	4	19	18	16	22	20
7 inches	9	30	24	24	32	30
8 inches	16	40	32	32	43	45
9 inches	25	55	42	45	56	55
10 inches	36	67	54	59	70	70
12 inches	64	101	79	80	105	105
14 inches	100	154	114	120	146	150

From these figures it may be argued that the Scribner rule should be adopted as a compromise between the Doyle and actual scales. As a matter of fact, it has been in use for some years now, in the work connected with the National Forest Reserves of the United States. This does not necessarily mean that it is a satisfactory scale, but rather that it has been adopted for sake of uniformity in the work of estimating timber, making tables of growth, etc. Being a diagram rule (as is also the Quebec) its values cannot be readily corrected so as to make them conform to new or special conditions of manufacture.

The Cubic Foot Unit of Measurement

From what has been said, it will be seen that there are real difficulties in the way of adopting any particular board measure rule as the standard unit of measurement throughout the whole Dominion. What I would suggest is the adoption of the cubic foot unit. It has been used for many years now for the measurement of square and waney timber, and everybody understands it. For the sale of pulpwood, extract wood, fuel, etc., it is a most satisfactory unit of measurement, and the purchaser knows exactly how much he is paying for.

Even if all the parties interested could be got to agree upon any one of the log rules at present in use, much would depend upon the method of applying it; particularly in the case of long logs. In South America, in Japan, in the Phillipine Islands and throughout the greater portion of Europe, timber is generally sold by the cubic metre. As we would find this unit of measurement rather confusing, and are already familiar with the cubic foot unit, I should say, by all means, let us adopt it. Logs with the greatest diameter would naturally command the greatest price, as is already the case with poles, posts and spars; and the manufacturers would soon find converting factors if they wished to saw them into boards. People in other countries find a cubic unit of measurement a most satisfactory one, and there is scarcely any doubt that the Canadian people would find the cubic foot the most satisfactory unit of measurement. Such unit would be fair to both buyer and seller and it would be a matter of supreme indifference to the seller whether the buyer saws them into boards, plank or deal; converts them into railroad ties, dimension stuff, scantling, lath, pickets or shingles; grinds them up for pulp; slices them into veneer; or burns them.

A. H. D. Ross.

The Rosedale Lumber Mills Accident

The importance of taking every precaution to prevent accidents to lumber employees was forcibly brought out by the verdict returned by the jury in an inquest held at Toronto on April 27th, into the death of J. A. Leslie Smith, who was killed by the falling of a load of lumber at the Rosedale Lumber Mills, Toronto, on April 20th. The jury's verdict was as follows:

"We find John A. Leslie Smith came to his death as the result of injuries received during the discharge of his duty as a member of the night crew at the Rosedale Lumber Mills on April 20th.

"We find the direct cause of the accident was the imperfect and uneven position in which the load of lumber was placed on the receiving car, causing it to give way and to precipitate the lumber on the deceased.

"We further find there was no mechanical device or safety locking arrangement whereby the car could be held in safe and proper position during its loading from the mill.

"We also find that the lighting facilities at the mill were sadly imperfect and that it was impossible for the deceased to properly adjust the load, or to discharge his other duties in a satisfactory manner."

At the time of the accident another employee was also injured, who died subsequently. The evidence of Leslie's fellow employees was to the effect that no carelessness had been exercised by the deceased. The car which was being loaded, they said, was an exceptionally strong one, and the accident had happened, they believed, from its not being put into the stall as far as it should have gone.

Ontario's New Stumpage Charges

Details of the Changes Which Have Been Made—Outline of the Former Regulations

As indicated in the "Canada Lumberman and Woodworker" of April 15th, the Ontario Government has decided to make substantial increases in its charges for stumpage dues, ground rent, and transfers, in connection with timber cutting licenses. The stumpage dues on the old licenses which were secured prior to 1903 have been increased to $1.50 per thousand feet. There will, therefore, be two classes of stumpage dues now, instead of several, viz., $1.50 and $2 per thousand feet. The history of the stumpage dues in Ontario since Confederation is brief. From 1867 to 1869 limits were leased with dues of 50 cents per thousand feet. From 1869 to 1887 the dues were 75 cents; from 1887 to 1902 they were $1, and from that date till the following year they were $1.25. Under the sales since 1903 they have been $2. These latter are left unchanged, but on all the limits held under licenses secured previous to 1903 the old dues have been replaced by a uniform charge of $1.50 per thousand feet.

Ground rents have been increased from $3 to $5 per mile. For the limits leased at the sale of 1903 the ground rents were already $5, but for previous sales it had been $3. The $3 rate was fixed in 1887, prior to which it had been $2 back to $1869. From 1867 to 1869 the ground rent on limits sold was 50 cents. All these old rates of ground rent have now been replaced by a uniform rate of $5 per mile.

Transfers of leases will now cost $5 a mile. Formerly the price of a transfer was $1 per mile.

In addition to stumpage fees, ground rents and transfer fees, the Government makes an extensive revenue from the sale of timber limit licenses, by means of the bonus. Lumbermen are invited to bid upon limits and the license goes to the party offering the largest bonus per thousand feet. Formerly the bonus was estimated at so much per square mile. This was changed in 1905 to a bonus per thousand feet, so that the Government might secure payment more nearly on the actual value of the timber.

From still another point of view the new regulations will be remunerative to the Government. In future owners of timber limits must pay for the fire ranging on their limits. Formerly the Government paid one-half the cost and the owners one-half.

The regulations outlined above relate to pine saw logs. The dues on square timber have been increased from $20 to $50 per thousand cubic feet. The dues on hemlock have been increased by 25 cents per thousand feet, and are now 75 cents.

A number of other small changes have been made. The dues on square timber of elm, ash, tamarac and maple have been increased from 2 cents to 3 cents per cubic foot. On square timbers of birch, basswood, cedar, poplar and all boom timber the dues are now $2\frac{1}{2}$ cents per cubic foot. Formerly they were $1\frac{1}{4}$ cents. On square timbers of red and white pine and jack pine, the dues have been increased from 2 cents to 5 cents per cubic foot. All other woods in square timber are to be charged at 2 cents instead of 1 cent per cubic foot.

The only other increases are for basswood and poplar. The dues on basswood are raised from 75 cents per thousand feet b.m. to $1, and on poplar from 50 cents to $1 per thousand feet b.m. Under the old regulations the dues on all other woods were $12\frac{1}{2}$ cents per thousand feet b.m. They have now been increased to 50 cents.

The new dues will apply on all leases, from the time of renewal on May 1, 1910, and will not be changed for a period of ten years.

The new stumpage dues in detail are as follows:

Square timber, black walnut and oak, per cubic foot, 3 cents; elm, ash, tamarac and maple, per cubic foot, 3 cents; birch, basswood, cedar, poplar and all boom timber, per cubic foot, $2\frac{1}{2}$ cents; red and white pine and jack pine, per cubic foot, 5 cents; all other woods, per cubic foot, 2 cents.

Basswood and poplar sawlogs, per M. feet b.m., $1; pine sawlogs, per M. feet b.m., $1.50; maple and oak sawlogs, per M. feet b.m., $1.25; hemlock, tamarac and other woods, per M. feet b.m., 75 cents; spruce, per M. feet b.m., $1; cordwood (hard), per cord, 20 cents; cordwood (soft), per cord, $12\frac{1}{2}$ cents; tan bark, per cord, 30 cents; spruce pulpwood, per cord, 40 cents; railway ties, per tie, 5 cents.

The Lumber Mutual Fire Insurance Company, of Boston, Mass., in their financial statement for the year ending March 31, 1910, show insurance in force amounting to $14,406,488.37, on which the premiums amount to $337,366.60. The net cash surplus amounted to $411,239.78. The company's total assets amounted to $1;606,357.10. During 1910 the company's losses amounted to $21,514.48, and the dividends to policy holders amounted to $35,007.03. During 1910 the gain in the net cash surplus was $23,517.05. From 1895 to 1910, inclusive, the company's payments were as follows: total losses paid to policy holders, $621,971.72; total dividends paid to policy holders, $540,390.08. The rate of dividend to policy holders on terminating policies is 40 per cent.

A Quiet Fortnight at Montreal

Lumber Trade Marking Time While Awaiting Navigation Opening—Shippers Making Active Preparations

Montreal Office of the "Canada Lumberman."
April 27th, 1910.

Awaiting the opening of the navigation season, there has been a noticeable lull in lumbering circles during the past week. The requirements of the retail trade have not been particularly heavy, but it is comforting to learn that their present stocks show signs of depletion and that retailers must soon be in the market for a replenishment of their stocks. Undoubtedly a great deal of lumber is being consumed locally and building permits continue to be taken out at an average rate of 30 per day.

Active preparations are being made by the shippers to take advantage of the first available water facilities to get their work started for the season, and on all sides criticisms are heard of the slowness of the Government in getting the canal service under way. One or two shippers are already preparing to make preliminary shipments and it is reported that one of the first vessels will leave here on April 29th partly loaded, and will finish loading at Tourville, for the English market. The announcement recently made by Major Stephens, chairman of the Harbor Commissioners to the effect that when the present improvements to the harbor are completed they expect to extend the navigation season in the port of Montreal to eight months instead of six, as at present, is welcomed on all sides.

The English market situation continues to show a slight improvement and rather more enquiries are reported. Pine timber, especially the better grades, is in excellent demand. The local lumber situation is practically unchanged. Mill cull pine 3-inch x 7-inch and up, is reported to be moving quite freely just now Dry merchantable spruce, 1-inch x 4-inch and up, is in splendid demand, and 1-inch x 12-inch in the same lumber is reported quite scarce. Trading in American yellow pine is unusually dull for this season of the year, but a more hopeful outlook is anticipated. Lath continue to be in good demand and are quoted quite firmly. Hemlock lumber is not in frequent demand, and dealers are not realizing their quoted figures. The shingle outlook, while quiet at the present time, is expected to show a steady improvement owing to an impetus it will likely receive through the Ontario trade requirements.

Personal News and Notes from Montreal

Mr. C. A. Spencer is on a western Ontario business trip.

Mr. Rudolphe Tourville has returned from a two weeks visit to New York.

Mr. C. B. Gradden, of Messrs. Gradden & Owens, is at present making a business trip through Ontario.

Mr. W. K. Grafftey, manager of the Montreal Lumber Company, Limited, has returned from a two weeks visit to New York.

It is stated that Mr. Menier, proprietor of the Island of Anticosti, will erect a large and up-to-date pulp mill on the island shortly.

The Tourville Lumber Company state that their log drives are well under way and they expect to commence sawing at their Louisville Mills, Quebec, about May 1st.

The Western Lumber Company, 180 St. James street, Montreal, have completed their arrangements for the disposal of this season's spruce lumber to the New York market.

The report that Mr. E. H. Lemay, the well known lumberman, was about to retire is absolutely without foundation, according to Mr. Lemay himself in a statement to the "Canada Lumberman."

The Emberton Lumber Company, of Lake Megantic, have recently purchased from the Brompton Pulp & Paper Company all their timber limits in the township of Louise at the head of Lake Megantic.

Messrs. J. & W. Duncan have commenced sawing operations, at their mill at Sixteen Island lake, thus getting under way one month earlier than last year. Their cut this year comprises about 60,000 spruce logs which were taken close to the vicinity where the mills are situated.

It is stated that almost all the pulp mills in the Quebec district are preparing to increase their output materially in view of the increased demand expected from Quebec as a consequence of the Government's action in prohibiting the export of unmanufactured pulpwood cut on Crown lands.

Plans have practically been completed by the L. J. Marchand, Inc., lumber manufacturers, Davidson and St. Patrick streets, for the absorption of the Verdun Lumber Company. It is expected that the change will take place about May 1st. L. J. Marchand, Inc., was recently chartered with a capital of $20,000.

The demand on the part of the United States customs regulations that a tally sheet showing the number of pieces, with their size and length, which each car of lumber shipped into the United States contains, is not generally regarded as a hardship by the Montreal shippers. In fact, as far as the "Canada Lumberman" could ascertain the new regulation is welcomed by a majority of dealers, who at present compile such a tally list for all their shipments, both foreign and domestic. While it involves a little trouble to make out, this list is extremely serviceable in checking up errors should they occur, and the enterprising firms appreciate the new move that will compel all shippers to follow suit.

Miscellaneous News of Interest to Lumbermen

Responsibility for the starting of bush fires has been changed by the British Columbia Legislature from the owner of the land to whomever starts the fire, whether he be owner, occupier, agent, servant or contractor. A permit must be taken out as before.

The wholesale lumber and marine business of E. A. LeBel, Sarnia, Ont., has been incorporated under the laws of Ontario, and hereafter will be called LeBel, Turnbull Lumber Company, Limited. The officers are: E. A. LeBel, president and manager; H. Turnbull, vice-president; J. H. LeBel, secretary-treasurer.

About 60 miles up the Saskatchewan river from Strathcona, Alta., a large force of workmen has been engaged during the past winter building storage booms for the annual cut of logs in the timber limits farther up stream. The booms will, however, be far from complete when the spring drive of logs is ready to be sent down and they will be of no assistance this year in the event of danger arising from high water.

When completed, which will probably be some time during the coming summer, the storage booms will have a storage capacity for 30,000,000 feet of logs and will ensure against any future loss to lumbermen during the flood season. The drives will be steered into a long lagoon bordering the north side of a big island and will be retained there by coffer dams and booms.

A fair amount of progress is reported by the Dominion Forestry Branch in this season's work of collecting statistics regarding the use of wood in the various woodworking industries during the past year (1909). Some 33 per cent. of the total number of schedules have so far been returned.

The number of responses received from the different industries varies greatly. Manufacturers of agricultural implements, furniture and veneer, head the list in returning the schedules sent to them, while the lumber manufacturers rank rather low in this respect. A number of pulp manufacturers also have still to report. Steam and electric railways occupy an intermediate position.

A second circular is now being prepared to be sent to those establishments that have not yet sent in their replies, and the department hope that prompt replies will be received to this, so as to enable them to publish their returns for 1909 promptly. The information given in response to these circulars is treated as strictly confidential, and the use made of this information in making up the totals can easily be seen from a reading of the Forestry Branch's Bulletin No. 8 ("Forest Products of Canada, 1908"), of which a copy may be had gratis by anyone on application to the Superintendent of Forestry, Ottawa.

The Canadian Trade Commissioner at Melbourne, Australia, Mr. D. H. Ross, in his latest report states that renewed activity has been evinced in the inquiry for spruce at Melbourne. Four large importers at that city were, at that time, open for cargoes of from 500 to 700 standards each. It was to be regretted that Canada could only offer one cargo at an advance on former quotations, viz., £10 10s. ($51.10)—less 2½ per cent. on the f.o.b. value—ex-ship Melbourne per the St. Petersburg standard of 1,980 superficial feet. A cargo of 600 to 750 standards was placed at that figure. Further inquiries met with the reply that stocks were exhausted owing to the demand from the United Kingdom. Box makers had experimented with various varieties of lumber and had now returned to spruce, considering it the most suitable for box making. It was therefore unfortunate that Canadian supplies could not be secured.

Canadian exporters of spruce could ship by the new line of cargo steamers to Australia. By this line Canadian mills should be encouraged to cut 3-inch deals, especially for the Melbourne market. Good business could be done with regular monthly shipments if prices were satisfactory. There is an increased demand for imported lumber at Melbourne, and British Columbia Douglas fir or "Oregon" is much favored. The latest quotations for Oregon was £4 3s. 6d. ($20.32) per thousand superficial feet, ex-ship Melbourne, based on schedule E. The building trade is reported to be very active and large quantities of "Oregon" will be required.

The Edgewood Lumber Company, of Edgewood, on the Arrow Lakes, B.C., have purchased a band mill with a capacity of 75,000 feet per day, from the Vancouver Machinery Deport, Vancouver. The sawmill machinery is being made by the Prescott Company, of Menominee, Mich. When completed, the mill will be one of the most modern in the country.

The B. C. Gazette gives notice of the incorporation of the following companies: The Shortreed Shingle Company, Limited, capital $10,000; the McLelan Lumber Company, Limited, capital $50,000; Fort George Supply Company, Limited, capital $50,000, to carry on business as lumbermen, sawmill men and dealers in lumber, shingles, etc.; Slocan Lake Lumber Company, Limited, capital $100,000.

News From Maritime Provinces

Annual Meeting of St. John River Log Driving Company — New Brunswick Cut will Show Increase

The annual meeting of the St. John River Log Driving Company was held in the Board of Trade rooms, St. John, N.B., recently. The old board of directors were elected with the exception of George A. Hilyard, who takes the place of his father, the late Henry Hilyard, on the board The board of directors consists of the following: J. Fraser Gregory, F. C. Beatteay, John A. Morrison, Charles P. Baker and George A. Hilyard. At a subsequent meeting of the board, J. Fraser Gregory was elected president and L. H. Bliss secretary and manager.

John S. Scott, who has had the contract for the driving operations for the past four years, has been given the contract again this year. The meeting was taken up largely with routine business. Last season one hundred and twelve million feet of logs was the result of the season's work. Operations will be started at once and it was said after the meeting that work was probably already begun. Lewis H. Bliss, of Fredericton, secretary and manager, said that it was early yet to give any idea as to what was to come. There had not been as much snow in the woods as last year, which would, of course, be a detriment. He said, however, that matters sometimes worked out so that what might look an unfavorable season turned out all right in the end.

Hon. W. C. H. Grimmer, Surveyor-General of New Brunswick, announces that the lumber cut on Crown lands of the province for 1910 will amuont to 265,000,000 superficial feet at least, and may run as high as 280,000,000 feet. These figures are in excess of anything ever heard of in the Crown Lands Department and will be at least 60,000,000 feet greater than last year's cut.

Hon. John Morrissy, Commissioner of Public Works for New Brunswick, estimates that the lumber cut on the Miramichi will be at least one-third larger than last year. While the cut in Northumberland has been above the average, that on the Restigouche is, according to Mr. Morrissy, still more remarkable. The opening of 80 miles of International Railway facilitated operations greatly, 4,000 men having been at work along the line throughout the winter.

Mr. F. C. Whitman, president of the Lumbermen's Association of Western Nova Scotia, estimates that the lumber cut this year in Nova Scotia will be about 60 to 75 per cent. of the normal crop.

Seventeen Kittens at Hamilton

Splendid Concatenation of Eastern Canada Hoo-Hoo in the Ambitious City—An Enjoyable Programme

Editor, "Canada Lumberman,"—It was the writer's privilege to preside at a Concatenation of the celebrated Order of Hoo-Hoo, held in Hamilton on the evening of April 22, and at which there was quite a representative attendance. Amongst those present were our worthy and honored Snark of the Universe, W. A. Hadley, and several past Vicegerents, namely, H. P. Hubbard, D. Ferguson, J. G. Cane, W. J. MacBeth and J. L. Campbell.

The Nine was composed of the following: Snark, Thos. Patterson; Senior Hoo-Hoo, Herbert Capewell; Junior Hoo-Hoo, Donald Ferguson; Bojum, James G. Cane; Scrivenoter, Jesse Tilley; Jabberwock, G. H. O'Neil; Custocation, G. M. Ingram; Arcanoper, J. Lauder; Gurdon, Jas. B. Leitch, and the way the work was carried out reflected credit on all concerned, particularly our friend with the big voice, who filled the position of Junior Hoo-Hoo.

The Seance in the Onion Bed

At the Seance in the Onion Bed, seventeen dead-game sports were put through the transforming process and all emerged with flying colors. This enlightened group are known to their friends as follows: William "Weakling" Barron, Hamilton, Ont.; Herbert Scott Brennen, Hamilton, Ont.; Harry "Bargain" Biggert, Hamilton, Ont.; Joseph "Baserunner" Bowman, Dundas, Ont.; William Alexander Chisholm, Donald, Ont.; George Horace Hollister Hills, Buffalo, N.Y.; E. Palmer Kinsman, Hamilton, Ont.; Herbert Arthur Leak, Toronto, Ont.; William "Caruso" Paynes, Toronto, Ont.; Henry "Whirlwind" Slater, Waterdown, Ont.; William Andrew Workman "Shingle" Smith, Hamilton, Ont.; Roy Robert Stewart, Hamilton, Ont.; Robert Wallace Simpson, Leamington, Ont.; Kurven "Crossarm" Shirton, Dunnville, Ont.; Horace "Terrible" Terry, Toronto, Ont.; William Bruce Swanton, Donald, Ont.; Charles Harvey Zimmerman, Hamilton, Ont.

At the conclusion of these preliminaries, all hands adjourned to the banquet hall, where a tasty menu put everyone in good shape to enjoy a fine programme of music interspersed with several snappy, impromptu, five-minute speeches, in which a number of good suggestions were made that might add very much to the usefulness of the Order.

Snark of the Universe Hadley spoke in his usual happy manner, and impressed on the members the advantages of a trip to San Francisco the next Annual and the pleasures of meeting the members and their wives who usually turn out on these occasions. Mr. Hadley also spoke feelingly of the gap caused by the absence of two familiar faces from the gathering, namely, our late brothers Higgins and Wilson.

Mr. Campbell pointed out the advantages of a mutual insurance arrangement amongst retailers and showed how this had reduced the rates in the West more than 50 per cent.

Life Insurance for Hoo-Hoo Members

Mr. Ferguson also advocated something in life insurance on similar lines to that of the commercial travellers, and also pointed out, and with good reason, the necessity of some better understanding between the wholesalers and retailers with regard to a legitimate dividing line between their customers, and instanced several cases which pointed to a much better arrangement of this feature on the American side of the line.

The musical entertainment, under the care of Brothers Crosthwaite, Long and Taylor, was particularly enjoyable. The members present were: W. J. Aitchison, A. S. Brennen, J. L. Campbell, Jas. G. Cane, Herbert Capewell, H. K. Crosthwaite, H. Fonger, D. Ferguson, A. E. Gordon, H. M. Gray, H. P. Hubbard, W. A. Hadley, Geo. M. Ingram, J. P. Johnson, J. C. Keenan, C. S. Kilgour, J. B. Leitch, Jas. Lauder, Guy H. Long, J. T. Leckenby, A. Laidlaw, W. J. Lovering, W. J. MacBeth, G. H. O'Neil, Thos. Patterson, E. S. Smith, J. J. Shortreed, J. L. Stewart, Fred Taylor, Chas. H. Taylor, Jesse Tilley and — Whaley

After the conclusion of the programme, all hands joined in singing the National Anthem, and were unanimous in their praise of the enjoyable evening just closed, and expressed their wish that they would have a similar opportunity to enjoy themselves some time in the near future.

Thos. Patterson, Vicegerent Snark for Eastern Canada.

Decrease in St. John Exports

The United States consul at St. John, N.B., has issued a statement showing the exports from his consular district to the United States. The total shows a falling off of $60,000 in comparison with the corresponding quarter of 1909. The exports of lumber and lumber products for the quarter were as follows:

	1910	1909
Box wood	$	$ 500.00
Laths	48,217.05	67,508.25
Lumber	64,721.19	89,969.11
Pulp wood	.....	9,436.15
Shingles	1,044.34	8,584.48
Ship knees	.....	891.75
Wood pulp	161,898.89	116,264.64
Total Canadian products	$275,881.47	$293,154.38
Products of American logs:		
Laths	$ 18,388.82	$ 43,046.35
Lumber	153,177.15	168,687.56
Shingles	15,043.65	13,148.08
Totals	$186,609.62	$224,881.99

Lumber Shipments from St. John

Shipments of lumber from St. John, N.B., during the first two weeks of April were as follows:

Vessel and destination	Cargo.
April 1—Margaret May Riley, New York	243,085 spruce plank and scantling
April 1—Pandora, Boston	126,951 spruce plank and boards
April 1—Winnie Lawrie, New York	253,027 feet spruce deals
April 1—Witch Hazel, New York	200,369 feet spruce deals
..	65,223 feet spruce boards
April 2—Priscilla, Salem, Mass.	134,642 feet spr. plank and scant'g
April 2—Shenandoah, London	220,920 feet spruce deals
..	180,389 feet birch planks
April 5—Salacia, Glasgow	84,341 feet spruce deals
April 5—Montezuma, London	2,922 pieces elm lumber
..	3,133 pieces birch plank
..	87,120 feet birch plank
..	427,841 feet spruce deals
April 5—H. B. Cousens, Vineyard Haven	1,947,100 spruce lath
April 5—Irishowen Head, Belfast	9,939 pieces deals
April 5—Peerless, New York	286,000 lath
April 5—Cora May, New York	152,346 feet spruce deals
April 5—Manuel R. Cuza, New York	1,400,000 lath
April 6—Victorian, Liverpool	554,534 feet deals
April 6—Manches'r Mariner, Manchester	213,066 feet deals
April 6—Georgie Pearl	153,703 feet plank and scantling
April 6—Hunter, New York	213,207 feet spruce deals
April 8—Thomas Hix, Quincy, Mass	100,961 feet scantling and plank
April 8—Grampian, Glasgow	388,677 feet spruce deals
April 8—Lake Champlain, Liverpool	223,377 feet spruce deals
..	400,306 feet spruce deals
April 11—J. A. Stubbs, Bridgeport, Conn.	1,017,000 lath
April 12—Sardinian, London and Havre	20,153 feet spruce deals
April 12—Oriole, New Bedford, Mass	142,925 feet spruce boards
April 13—E. Miriam, New York	344,622 feet deals

News from the Sunset Province

Details of Transfer of the Fraser River Lumber Company —Manufacturers Confident of a Good Season's Trade

In connection with the reorganization of the Fraser River Lumber Company, of New Westminster, B.C., it is interesting to note that the personnel of the company will be very little altered. The officials of the new company are: President, Mr. A. D. Davidson; Vice-president and general manager, Mr. A. D. McRae; Secretary, Mr. James D. McCormick, now general manager of the Columbia River Lumber Company at Golden; Directors—Mr. William Mackenzie, president of the Canadian Northern Railway Company; Mr. D. D. Mann, vice-president of the same railway; Mr. R. M. Horne Payne, president of the British Columbia Electric Railway Company; Mr. D. B. Hanna, of Toronto, third vice-president of the Canadian Northern; Mr. A. R. Davidson, president of the Saskatchewan Land Company of Winnipeg, and Mr. Peter Jansen. The present shareholders of the company will remain, taking stock in the purchasing company in lieu of payment. The bonds will probably be floated in England, but details have not yet been made public.

The Fraser River Lumber Company recently purchased the timber limits of the Chemainus Lumber Company in the Comox valley, Vancouver Island, comprising 75,000 acres and extending from Comox to Campbell river, a distance of 32 miles. This is reported to be the largest single timber transaction ever closed in British Columbia, the price being about $4,000,000. The tract is considered to be the finest area of Douglas fir in existence, containing between four and five billion feet. The Fraser River Lumber Company had previously acquired about 25,000 acres of timber limits in the Comox valley. The combined holdings give them the largest and most valuable tract in the province, the value of which is estimated at $6,000,000.

One of the most important moves which the company intends to carry out is the erection of a large cedar mill in connection with their present mill, the estimated cost of which is $250,000. The proposed improvements also include a sash and door factory, a shingle plant, a box factory and a veneer plant, to be built within 100 feet of the company's present plant and to be operated by electricity. These improvements and additions, it is claimed, will easily make the company the largest lumber manufacturing company in the world. The sash and door factory is to have an initial capacity of 1,000 doors and 2,000 sashes per day, which will be increased as the business demands. The shingle mill will be equipped with 15 shingle machines and will have a capacity of about two carloads of shingles per day. The power for the new mill will be furnished by an electric turbine generator of 1,000 k.w., and all the machines will be operated entirely by electricity. A force of about 200 men will be employed in the new cedar mill, which will have a daily capacity of about 100,000 feet.

The reorganization of the company is meeting with some legal difficulties in the form of a writ issued by Mr. Lester W. David, for an injunction to prevent the carrying out of the proposition. Mr. David, who is now in Europe, has cabled instructions for the issuance of the writ, on the ground that there is due to him on account of the purchase of the Fraser Mills property by the present holders something like $215,000 without interest. The company claim that on account of a shortage in the amount of timber turned over to them by Mr. David there is due to them compensation in the sum of $250,000.

Will Enforce Law Strictly

Arrangements are being perfected by the British Columbia Attorney-General's Department, for a much more stringent and effective enforcement of the law prohibiting the export of unmanufactured British Columbia logs, the machinery of the law in this regard having been materially strengthened and improved at the recent session of the legislature. In the past, steamers found with booms in tow suspected of being bound for a foreign port, have merely given bonds and escaped, it being impossible, as a general thing, for identification to follow the logs, and convictions as a rule being attended with the utmost difficulty. Hereafter the Government proposes to accept no more bonds, but to seize both steamer and tow where infraction of the law can be brought home, selling both logs and vessel as equally guilty principals. It is also intended to commission almost immediately two fast steamers for continuous patrol duty in the Gulf of Georgia, so that defiance of the law that has done so much toward promoting the manufacture of British Columbia timber will henceforward be attended with infinitely greater risk than in the past.

Good Prospects in the Interior

The lumber situation throughout the interior of British Columbia as the spring opens out shows a very marked change for the better. W. A. Anstie, secretary and manager of the Mountain Lumbermen's Association, stated recently that the only drawback at the present time was the dearth of common unskilled labor at the sawmills of the interior, covering a wide section of the province.

"I am speaking conservatively," he said, "when I say that there is steady work for from 1,000 to 1,500 men at the lumber mills at the present time. We want white labor and prefer it, but find it difficult to get anything like sufficient men. For common labor, the kind now wanted everywhere in the district, the wages paid run from $2.25 to $3, and the average pay for good men is about $2.75 per day. All the sawmills are in operation and very many are working night and day, but are handicapped by the scarcity of common sawmill help offering. If we can get the men quickly there will be plenty of work for them this season and the lumber mill business will boom."

Mr. Otis Staples, of Wycliffe, B.C., in a recent interview, stated that prices of lumber were certain to advance during the approaching summer. He also expressed himself forcibly upon the matter of the destruction of the forests. If the destruction continued at the rate which was prevalent now, he said that the time would come when the timber resources would be exhausted. Artificial reforesting, he believed, however, would not be necessary, as some people thought, if proper care were taken to guard against forest fires. If the fires were prevented the trees would seed themselves as fast as they were cut down. The laws in British Columbia, however, at present were not stringent enough upon this matter.

Errors and omissions in the lumber tariff schedules of the United States and Canada are responsible for the building of the plant of the Rainey Lumber Company at Bellingham, Wash., which will be started within a month or so. The plant is to utilize lumber classified under the American tariff schedule as neither log nor timber, that is timbers with eight inches or more square surface each way. In the tariff schedule this is the only timber that can enter the United States duty free, and this because the tariff law is silent upon the subject. The William J. Rainey mill will receive supplies from the Davidson & Ward mill in British Columbia. Only in this way can lumber manufactured from Canadian timber reach the American market free of duty charge.

Mr. R. H. Alexander, in an address at the annual meeting of the Vancouver Board of Trade, stated that the lumber produced in British Columbia during 1909 was estimated as amounting in value to $12,000,000, which is equal to the best year in the history of the industry. The outlook for 1910 was so bright that a considerable increase might be anticipated in all branches. Mill owners were complaining that, notwithstanding active business, there had been little or no margin of profit for them, but that the retailer secured the lion's share. In the interests of the industry it was desirable that, without increasing prices, a reasonable proportion of profits should be received by all engaging in it.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry:

564. Maple flooring—A South African Government department desires to be placed in touch with Canadian shippers of maple flooring. Quotations to be c.i.f. East London, net prices, shipping gross weights, samples and any other useful information must be sent. The flooring will shortly be required, hence exporters are requested to expedite matters.

569. Wood pulp. A well known firm of German import agents in Berlin desire to get in touch with Canadian exporters of wood pulp.

574. Wet wood pulp. A prominent firm of pulp dealers in London wish to get quotations on wet wood pulp, f.o.b. or c.i.f. Rouen, France.

610. Lumber.—A Newfoundland firm is open to purchase all kinds of lumber in the rough.

629. Picture mouldings—A North of England firm largely interested in the import of picture mouldings ask for prices and particulars from Canadian manufacturers of picture mouldings (except oak).

631. Veneer—A firm of large buyers of veneer in the North of England will consider samples and prices of three and five-ply from Canadian manufacturers.

679. Lumber, etc.—A prominent commission merchant in Guadeloupe, West Indies, desires to hear from Canadian exporters of lumber suitable for the West Indian market. Is also prepared to ship West Indian products to Canada.

689. Furniture timber—A South African firm of house furnishers desire to be placed in touch with Canadian shippers of furniture timber, such as walnut and light satin walnut.

693. Oak planks—A South African firm of furniture dealers and cabinet makers desire to be placed in touch with Canadian shippers of oak planks 1-inch, 1¼-inch, 1¾-inch by 3-inch and 4-inch, in the rough. Quotations to be f.o.b. Montreal and St. John.

694. Poplar boards—A South African firm of furniture dealers and cabinet makers desire to be placed in touch with Canadian shippers of 1-inch poplar boards. Quotations to be f.o.b. Montreal and St. John.

695. Butter boxes—A large South African firm, with several branches, desire to be placed in touch with Canadian shippers of butter boxes 15 x 10½ x 11½. This firm are prepared to guarantee to purchase 10,000 boxes the first year and 20,000 the second, cash against documents in New York. Quotations f.o.b. Montreal and St. John.

700. Pine doors—A South African firm desires to be placed in touch with Canadian shippers of pine doors. Quotations to be f.o.b. steamer, and the ocean shipping rate to Delagoa Bay must be given. Cash against documents New York or Montreal.

701. Clear white pine—A large South African firm desire to be placed in touch with Canadian shippers of clear white pine. Quotations to be f.o.b. steamer Montreal and St. John, and the ocean shipping rate to Delagoa Bay must be given. Cash against documents New York or Montreal.

702. Clear pine—A South African firm desires to be placed in touch with Canadian shippers of carpenters' clear pine. Quotations to be f.o.b. Montreal and St. John, and the ocean freight rate to Delagoa Bay must be given. Payments cash against documents Montreal or New York.

The Retail Dealer and His Problems

Necessity for a Retailers' Association in Ontario—Credit Rules

Credit Rules for the Retail Dealer

The following rules to assist a retailer in determining credit and collections were formulated by V. R Smith and delivered at a recent convontion:

1. First impressions are best. The man who is a dead-beat usually has his pockets full of references.
2. Commercial agencies If the reports are followed a great many losses will be saved.
3. Investigate carefully and refuse to sell, if there is any doubt.
4. Lumber in yard is worth four times as much as an account on the books.
5. Push colections. Don't be afraid to offend.
6. Use the very best judgment, giving much weight to moral character; if he promises to pay at a certain time, see that he does it.
7. Open accounts are better than notes, because they are due every day, while a note is due only at a certain time, and if held by the original payee, he will have to prove delivery of the goods if he sues.

A Retailers' Association Needed in Ontario

One of the first essentials in the conduct of any line of business is straightforward dealing. In the sale of lumber, it is perhaps more important than in some other lines. There is so great an element of doubt about lumber in the matter of grades that misunderstandings are every day occurrences and unless one is both straightforward and frank in his business methods he is likely to encourage among his business connections a feeling that his trade is not worth going after. Between the retailer and the wholesaler perhaps, the possibility of this sort of thing is greater than in other branches of the business, because both are fairly conversant with the grades of lumber and cannot in the long run be deceived more than once or twice. In Ontario the relations of the retailer and wholesaler are far from satisfactory in many cases and yet the difficulties are not so much those which arise from unfair business methods as from lack of co-operation.

The retailers of Ontario are working largely at cross purposes so far as any consideration of their mutual interests is concerned. There is nothing in the form of co-operation. More than anything else probably, the retailers are in need of an association by means of which their mutual interests may be promoted. Take, for instance, the matter of insurance alone, the cost of insurance for the retailer in Ontario is so high that he cannot in the majority of cases carry anything like the amount that is necessary. As a result, he is continually anxious about his position. A fire may wipe out in a few hours all the profits that he ever made, and render him financially incapable of continuing in the business on the same scale as formerly. This matter also concerns the wholesaler very closely. In the retail yards all over the country there are large quantities of stock for which the wholesalers have not yet been paid, as they give the retailers fairly extensive credits. If a fire wipes out the retailer's stock, the wholesaler has no security for his money. He must take his position along with the rest of the creditors and bear his share of the loss.

Something should be done at once to organize a retail lumbermen's association in Ontario on lines similar to those of the Western Retail Lumbermen's Association, the headquarters of which are at Winnipeg. One of the first steps taken by this association was to form an insurance branch. The results were encouraging from the outset. The rates of insurance were greatly reduced and retailers were enabled to carry an amount of insurance far more commensurate with their liabilities to loss. The wholesalers being no longer in great fear of loss of stock for which they had not been paid, were able also to give the retailers far more satisfactory terms of credit. A plan of this sort could be worked in Ontario more satisfactorily than in the prairie provinces because of the greater compactness of the population. At the recent meeting of the Canadian Lumbermen's Association this question was brought up and the discussion showed that the wholesalers considered the lack of insurance carried by retailers as one of the most serious drawbacks to their business.

There is, however, an even more vital problem for wholesalers to solve, and that is the elimination of the man who is always making unfounded complaints about the grades of the lumber he receives. A wholesaler will ship a carload of lumber to a retailer and in many cases receive word shortly afterwards that the lumber is not up to specification. This may be the case sometimes, but the occasions are far too frequent when it is not so, and the object of the retailer is to secure a rebate on the price, to which he is not entitled. Many a wholesaler now makes a practice of visiting the retailers personally when such a complaint has been made and sometimes he finds that not only is the lumber not below grade, but the retailer has not even looked it over. He has made the complaint, in fact, as a matter of course, without knowing anything about the lumber. Such chronic kickers are doing great mischief to the trade and should be put out of the business by refusal on the part of the wholesalers to ship them stocks. Respectable retailers, of whom fortunately there are a large number, should take this matter up. It can only be done by the formation of some sort of an association which will, by personal attention to the matter, be in a position to co-operate with the wholesalers for the improvement of the trade. As matters stand to-day, the wholesalers must either make a personal trip to investigate a complaint or remain in the dark and frequently sell their lumber at a loss.

There is something in the class of business which the retailer has to carry on which has a tendency to make him a kicker unless he is scrupulously careful about his methods. In his dealings he is continually meeting with people who do not know enough about lumber to understand the various grades, and who often imagine without reason that they are being sold an inferior article. The irritation which naturally arises from this must either be borne patiently by the retailer or passed along to someone else, and the wholesaler is the unlucky "someone else." The formation of an association of retailers is the only method by which these troubles can be overcome and they could be dealt with so effectively in this manner that it is a wonder that these steps have not long ago been taken.

Buying Retail Lumber stocks

One of the most important features of buying lumber is to be sure that the buyer is in need of the stock and that the seller **has the stock** on hand, or can soon produce it, in such grades and specification as desired by the buyer.

The first requisite is a business acquaintance between the parties interested, each having confidence in the other, and especially is it necessary on the part of the buyer to know that the seller is able to produce the goods.

In the first place, when a buyer makes up his mind that he wants to buy stock of certain kinds he should decide upon what class of concern he should buy from, namely, if he wants to buy pine lumber he should buy it from a mill producing pine lumber, and the same condition should prevail on any other class of material; that is, he should buy from those who manufacture the kind of stock wanted; in other words, don't go to a dry goods store to buy groceries.

After having selected a number of concerns of equal quality, it is then time to solicit prices by mail, personal call, telephone, conversation with salesmen. All of these methods are usual and generally produce satisfactory results.

In a general way, this subject might be handled under the following captions:

First: Business relations existing between the buyer and seller.
Second: Equitable terms of sale.
Third: Other methods.
Fourth: Kinds of stock most profitable to handle in a retail yard.

Taking up the first question in discussion, namely, business relation existing between buyer and seller, I believe that cordial business relationship existing between parties to any transaction is always a great help in arriving at the best results. It is not necessary for his relationship to be carried further than the office, at the same time I believe we will all find many of our best personal friends among people with whom we do business. Much has been said about the retailer and the manufacturer of lumber, but still they are only human beings, and if standing side by side a stranger would see no particular difference in their make-up. They are both playing the game to make a profit on the money they have invested in their particular industry. In the majority of instances both retailer and manufacturer are adherents of the Golden Rule, but the few exceptions in both classes are sufficient to make it an important part of any transaction that all its details be thoroughly understood.

In asking the seller for quotations, it is always better to specify exactly what you want, whether your request is made by mail, telephone or personal interview. For instance, if you ask a man for a price on a quantity of 8-inch finish of a certain grade without specifying lengths, and his reply indicates a satisfactory price, it would not be fair when making up the order to specify lengths, and should lengths be specified I would not be surprised to have the order returned with request for revision to agree with the original enquiry.

Summing up this question, I believe that should the retailer order a car of flooring or any other material, specifying such lengths as he requires and paying the additional price demanded by the manufacturer, it should be the duty of the manufacturer in case he is unable to supply the material as ordered, to so notify the buyer, and not ship a car containing such lengths as is best suited to the manufacturer's stock, with-

out first securing such prviilege. The foregoing is in line with the ideas of many retailers, and also with some manufacturers with whom I have come in contact, as to the question of odd lengths that has recently caused so much stir in the ranks of both manufacturer and retailer.

Now, just a few words relative to this odd length matter. A man should be permitted to buy anything he wants. It is necessary for the manufacturer to charge more for stock if all in even lengths; we are unable to prevent it; but a retailer should not be obliged to buy odd lengths and stand a loss where his trade absolutely refuses to use such material.

Taking up the second topic, namely, terms of sale, for discussion, I am obliged, in conjunction with the majority of retailers, to admit that the manufacturers have the right to fix the terms of sale. I believe that settlements for cars where discount is taken, should be made within five days after arrival at the yard, and in most cases in our territory this condition prevails, and I do not believe many manufacturers would object to the further time elapsing in the isolated cases where cars are delayed.

Taking up the subject of order methods, I wish to lay particular stress upon the fact that the American Lumber Trades Congress have passed on certain ethics which should obtain between the buyer and seller. Among other things, each order should, as far as possible, constitute a contract and should be signed by the buyer and acknowledged by the seller, either in the form of an order acknowledgement or letter, stating that such order had been received and would be executed according to its specifications as to grades, lengths, prices and time for shipment. This will avoid a great many controversies which otherwise arise between the buyer and seller. It is very essential for the retailer to be particular in the placing of his orders. He should specify exactly what he wants in the customary terms used by the manufacturers in the particular territory where the stock is manufactured. If the retailer would be particular about specifying just what he wants in regard to grades, lengths and kind of material wanted, it will eliminate in a great measure all arguments arising through the question of odd lengths, terms of sale and many other differences of opinion occurring through improper construction of the terms of the order. In all cases the seller should acknowledge receipt of orders and should send the buyer copies as interpreted by him, thereby giving the buyer a chance to see exactly how the order is understood by the seller.

In concluding this topic, I would suggest that in the matter of ordering all items outside of regular stock, or for which you have a constant call, that you be very careful in ordering and not accumulate a large surplus of unsaleable goods, otherwise termed "cats and dogs," and if you do not do this, when inventory time comes you will find much of the same stock that you had at the last inventory that you would be very glad to dispose of at even less than cost.

In conclusion, a few words should be said relative to the adjustment of complaints on shipments and cancellation of orders. In most cases where complaints are made as to grades or shortages, all the evidence possible should be shown up fairly and frankly to the shipper. In many cases where this is done and there is justice in the complaint, very little trouble will be had in making an amicable settlement. If, however, you have made a claim which you are satisfied is just and the shipper refuses to entertain it, then arbitration, as provided for in the code of ethics adopted by the American Lumber Trades Congress, should be the remedy, and on the other hand, whenever the shipper is satisfied that the buyer is making an unjust claim, he should resort to the same procedure.

In cases of cancellation of orders by either the buyer or seller without just cause, then the same procedure should obtain as in the matter of adjustment of claims. However, I am speaking only of the isolated cases, and there are very few in either branch of the industry who are in the habit of cancelling orders without just cause.

I cannot conclude this discussion without the simple reference to the fact that you reap what you sow, and if you treat your constituents squarely you will in most cases find them coming back to you with a square deal and looking for more business; in other words, if you expect to get a square deal you must act upon the square yourself.

A Useful Device for the Retailer

A writer in the "American Lumberman," dealing with useful devices for the retail dealer, describes an unloading deck, which, though seldom seen in a yard, is a decided convenience. "To save demurrage," he says, "or if for some other reasons, it is necessary to hustle the lumber out of a car in quick time, it can be thrown out on this platform. On an average I think I see one of these unloading decks about once a year, and by good rights, as my grandfather used to say, I ought to see them oftener. I travelled a long distance to see a shed that had cost fully $5,000, and the builder said it had been his aim to incorporate in it all the modern shed conveniences. Having looked it over, I asked him where his unloading deck was, that as he was located he ought to make good use of such a deck. 'Unloading deck! What is that?' he asked. He never had seen one, and as he had not read an up-to-date lumber journal he had not read of one. When the use of the deck was explained to him he said he wished he had it. The water that would have turned the wheel, however, was away down stream, and he had lost out on a valuable shed adjunct because he had not read.

"Some reader may ask, 'What is it?' We will suppose that alongside of your shed runs a spur track and from a car standing on this track you can shove the lumber into the shed. This process, including proper piling, shoving the car back and forth that it may stand not far from the bin into which the stuff is to be unloaded, is necessarily rather slow work. Your force may be so busy you can't well spare the time to do it. You might go out and hire extra hands, provided you could find them, but this would cost extra money and help to swell the expense account. Here is where the unloading deck comes in at its best: The lumber is shoved from the car onto this deck, and possibly before it is placed in the bins much of it will be moved directly to the jobs. When there is a lull in business the lumber that remains on the deck can be piled where it belongs.

"If the railroad track runs through your yard, and the regular thing is to shove the lumber from the car to the ground, thence haul it to the sheds, you might think you could not afford to give a penny for an unloading deck; that you would want it only when the track runs along side your shed, though I have seen one in a yard, the lumber being put from the car onto it instead of on the ground. In a fine shed in Illinois, this unloading deck is built in the centre of the shed. This deck is deficient, inasmuch as it has no roof. Lumber on a deck of this kind may remain a rough pile for days, and in the meantime it should be under cover."

The Rip-Saw in the Lumber Yard

Many dealers are heard to express themselves as being adverse to the installation, in their yards, of machinery of any kind, maintaining that it is a nuisance and that no profit accrues from their use. Perhaps in forming their opinion they have observed instances wherein unwarranted expenditures have been made for tools for which there is not a daily use or in the installation of machines that require the services of a skilled, and consequently a high-waged, operator.

One tool, which I believe is almost indispensable to a well operated yard, is a small combination rip and cross-cut saw, and the retailer who has not availed himself of this convenience—if I may not say necessity—has been pulling his purse strings too tightly to admit the entrance of additional profits which rightfully belong there.

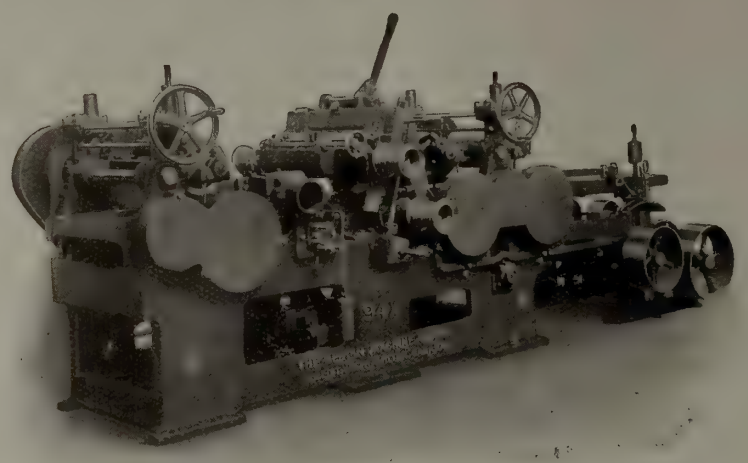
The cost of installation is not prohibitive. A suitable combination machine can be purchased for from seventy to one hundred dollars, and it can be operated at a surprisingly low cost, with either an electric motor or a gasoline engine.

In some nook or corner of the yard, every dealer has a "scrap pile," into which he throws the accumulation of odds and ends and short pieces of broken boards and dimension and perhaps a few sheeting boards and some dimension which have been returned by one of his good customers, after it has lain around his building, during course of construction and having been subjected in turn to snow or rain and the twisting influence of the rays of Old Sol, and which, as a result, are unsaleable.

Disposition of these "scrap piles" has been subject for discussion, both in retailers' conventions and through our trade journals, and gratified, indeed, are the dealers if they realize the actual ,first cost.

Right here is where the rip-saw will be found to be of inestimable value, by enabling the dealer to run the scraps into something for which there is a ready demand, thus making it possible to dispose of it quickly and at a profit.

Scarcely a day passes but that demands are made for items of stock of special dimensions which are very seldom kept in stock. Perhaps the very customer who returned the depreciated material is in need of some 1x2, or 2x2, for furring, or some short pieces suitable for bridging. At very small expense, the scrap pile can be worked to requirements and the customer pays a profitable price for material which originally would not have been accepted at all.



At times a stock of some particular dimension or length is entirely exhausted, either through an unusual demand which could not be anticipated in advance, or through delayed shipment. In these instances, it is a great convenience to be able temporarily to supply the shortage by ripping some of the wider widths.

Just at this time forest conservation is being vigorously agitated, and the retailer is expected to do his share toward eliminating any unnecessary waste of building materials. Men, if you will install a rip-saw and utilize the odds and ends around your premises and which are not infrequently consigned to the kindling pile, you will be deserving of equally as much credit for aiding in the real conservation of our forest products as is the wholesaler who insists on your relieving him of the short and odd lengths.

No attempt will be made to enumerate, further, any of the thousand and one uses which will be found for this machine—in fact, they are limited only to the resourcefulness of the operator.

U. S. Consul Alfred J. Fleming, Yarmouth, quotes a Boston man who made a trip through the apple section of Nova Scotia, contracting for some of the 1910 crop, as stating that indications are for an unusually large yield, which means probably about 1,000,000 barrels. Last year there was a short crop, and 600,000 barrels were exported.

Berlin Quality Counts

No. 94X Fast Fee

Equipped with Berlin bit Fast Feed Side Heads, we Planer and Matcher will quality of flooring at 150 right up to the work

The No. 94X is a powerfully constructed Planer and Matcher, built on a one piece frame and composed of as few parts as possible. No superfluous pieces—every part and adjustment is valuable in the 94X producing the finest quality of flooring at 150 feet per minute.

THE CYLINDERS.

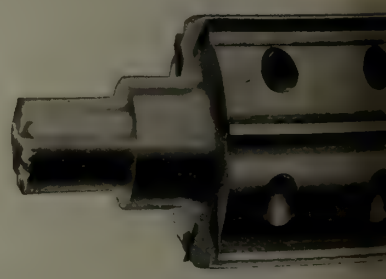
Our 6 knife Round Cylinder is the stiffest on the market. Unlike other cylinders, it will not spring under action of the cut. Nor can the screws expand the metal of the head.

We claim the following distinct advantages of this head over any other head:

1. That the method of knife holding affords greater pressure with less action on the screws than any other.
2. That it is the only method of knife holding where the pressure is with and not against the cut.
3. That it is the only head where the centrifugal force helps the screws to clamp the knives tighter.
4. That when this head is equipped with Pyt's Steel Knives, properly beveled for your work, you can handle stock at twice the feed of a soft steel knive machine, and at the same time save 15 per cent. to 30 per cent. in grades.
5. That this head at any feed will not tear out stock, no matter how knotty, cross-grained or stringy the fibre of the wood may be.

Another point is that there is no opening or crack back of the gib. The gibs form the lips for the under side of the knives, leaving no place for pitch or slivers to accumulate.

Still another point. This is the only 6 knife round cylinder in which the knives are set at such an angle that the proper degree of "scrape" may be obtained for all classes of work.



THE SIDE HEADS.

We are equipping the 94X's with 12 bit side heads designed especially for this fast feed work. At a feed of 200 feet a minute they *will not tear out even the knots and cross grained places* as much as other heads will at 60 feet a minute. And then again, it won't matter if the stock is somewhat twisted or uneven for the 12 bit heads will take as much as an inch cut when they are put to the task.

The most convincing testimony we can give you of the efficiency of the 12 bit side head is to quote you an extract from a customer's letter. He says: "And as for flooring, it does the remarkable stunt of 200 lineal feet per minute and makes perfect flooring."

AUTOMOBILE CHAIN DRIVE.

In order to help make the 94X stand up to this terrific speed of 200 feet per minute, we had to get away

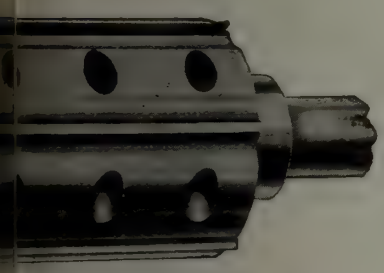
out for you the finest
per minute, and stand
m morning till night.



from the heavy grind of the gear drive. We worked out a method of successfully driving the feed works with chains and we style the device our Automobile Feed Drive, for it is not unlike the driving mechanism of the great racing cars.

The durability of this drive is proven. There are many instances of chain driven cars carrying an intermittent load over 20,000 miles of rough roads, without the least repairs. In providing such a drive for the 94X you are assured continuous service and long life. It does not have to stand up to the intermittent service, heavy shocks and instant changes of speeds.

In the Automobile Drive, we do away with the entire gear train. There are only twelve gears on the entire machine.

Another of the valuable features of the chain drive for a matcher feed works lies in the fact that it sets up no vibration to be transmitted to the cutter heads. The chain drive runs more quietly and with less vibration than the gear method and is exactly adapted to driving planer feed works.

D CYLINDER.

Still another valuable feature is that you don't have to tear down the machine to reach any part of the feed drive. Every part of the driving mechanism is enclosed but is instantly accessible.

Considering it from all points of advantage the Automobile Feed Drive is superior to all others.

No. 94X.

The No. 94X all through, is the very essence of economy in the manufacture of flooring, novelty siding, "V" joint, and beading. And if you are in any way interested in the manufacture of these above mentioned products you should know what the 94X will do for you.

We shall be pleased to send you all information you may require.

INQUIRE NOW.

We will gladly send you large descriptive circular of the 94X if you are interested. You may also have samples of the class of work which we guarantee the 94X will turn out for you. Sign and mail us this clipping:

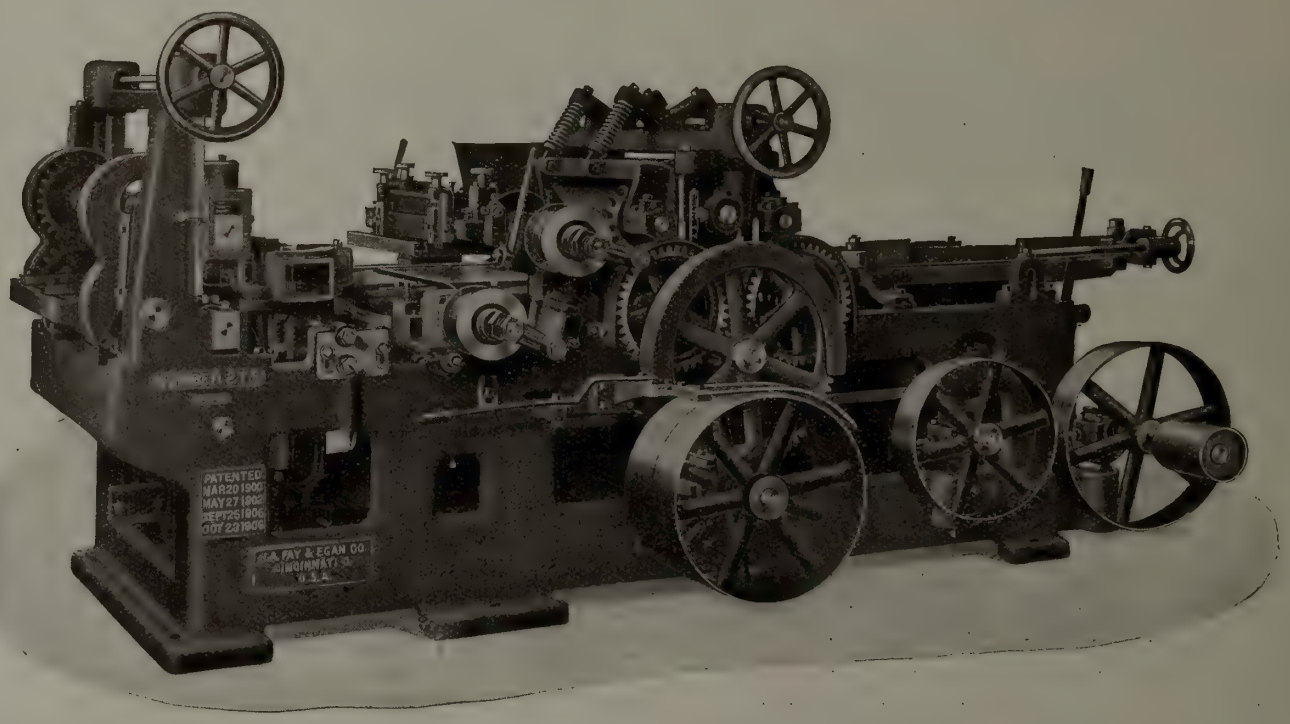
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A New Planer and Matcher

The firm of J. A. Fay & Egan Company have a model planer and matcher on the market (illustrated herewith), which they claim possesses many points of especial merit. The machine is designed to meet the highest requirements of planing mills and other woodworking plants for working in either hard or soft wood. It is claimed by the company that for its size and weight it cannot be surpassed by any machine on the market. It is not only a fine general purpose tool, but a first-class floorer as well. It will also work mouldings up to 1¼-inch deep, making it adapted to the working of patent drop siding, carpenter's mouldings, baseboards, casing, flooring, etc. This machine is made in four sizes, to work material 10-inch, 16-inch, 20-inch and 24-inch wide, and 8-inch thick.

The frame is of the open box type, giving easy access to all parts. It is strongly and heavily built and stands perfectly rigid under operation.



The cylinders are made from solid crucible steel forgings, four-sided and slotted on each side. Both are provided with take-up for end motion for cutting mouldings. The upper cylinder bearings are rigidly yoked together and are raised and lowered on powerful square threaded screws mounted on ball bearings. The lower cylinder is vertically adjustable, and, with the bar, after the cut, draws out at the side of the machine, a feature of much convenience in sharpening and setting the knives. If desired, the company can furnish their circular safety cutter head fitted with their high duty tungsten steel knives ,with grinding and truing attachment.

The pressure bars are adjustable to allow for 1½-inch projection of knives beyond normal cut on upper cylinder—¾-inch on lower cylinder, and 1-inch on side heads.

The matching spindles are adjustable across the machine and may be drawn clear to the side, out of the way for surfacing the full width of the cylinders without removing heads or clips. The left spindle is fitted with their improved matcher clip.

The feed consists of six double geared rolls. Only heavy pitched, wide faced gears are used, and all are keyed to shafts. They employ no studs. The two upper in-feeding rolls are carried on a pair of side housings, and are both raised or lowered at the same time and are never out of alignment. The out-feeding rolls are driven from the in-feeding end of the machine by chain and sprockets.

For further information, readers should write to the manufacturers, at 465-485 West Front street, Cincinnati, Ohio, who make a standard line of woodworking machinery.

J. A. Fay & Egan Coy's New Double Cylinder Planer and Matcher.

A Good Belt for Lumber Mills

There has recently been placed on the Canadian market an interesting Balata Belt, the Kebo brand, which, the manufacturers claim, is the most reliable and economical lumber mill belting ever introduced. A common trouble with textile belts lies in the fact that the plies readily come apart, involving trouble and expense and waste of time in the repair shop, very often necessitating delay when it can least be afforded. The plies of Kebo Balata are uniformly and permanently bound together by a special compound which the makers claim is the strongest adhesive known for this purpose. In addition to using this special solution, each individual ply of the belting is passed through heavy calendars immediately after the solution is applied, instead of merely compressing all the plies together, as is sometimes done with ordinary belting of this nature. By pressing each ply separately uniform distribution of the solution between the plies is secured, giving close and firm contact.

Special strength is also claimed for this belt as well as freedom from stretching. Each belt, before being sent out from the factory, is thoroughly stretched and seasoned.

The manufacturers draw particular attention to their claim that Kebo resists moisture and water, even withstanding the effects of salt water.

The Canadian agents, J. R. Baxter & Company, of Montreal, state that the makers of Kebo Balata were especially careful to avoid imitations and to originate a Balata belting which would stand out from the rest on its merits. Judging from recent severe tests which it has successfully undergone, they are convinced that it will command an extensive sale in the Dominion wherever a high class belting is in demand.

"Poles of Sterling Quality" are interestingly described in an illustrated booklet published by W. C. Sterling & Company, Monroe, Mich., who have been producing cedar poles for 30 years. They carry in stock 125,000 to 150,000 poles, always ready for immediate shipment, in addition to 200,000 cedar ties and a large quantity of posts, shingles and lumber. Their yard, they claim, is the nearest to the market on the Michigan-Ohio line, and there are only a few days haul for poles to Ohio, New York, Pennsylvania, Illinois and Canada. The booklet contains some interesting reading matter relating to cedar poles, from which the following is gleaned: "Experiments show how rapidly cedar seasons. When cut, winter cut poles weigh about 38.9 pounds per cubic foot, seasoned 10 months they weigh 25.5 per cubic foot. The average time it takes to grow a 30-foot cedar pole is about 190 years. This was determined by a count on 114 poles. Green cedar poles lose the larger por-

Lumbermen

Who are critical in their demands always find in our method of selling direct to the regular trade, the close attention to the minutest details so absolutely impossible to secure when buying haphazardly.

To provide for filling all our orders promptly and satisfactorily, we have large and well assorted stocks on hand constantly—a feature that can hardly help pleasing you.

We want to prove to you that we are different from the others in many ways.

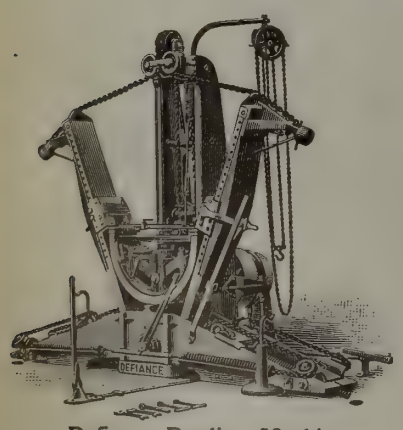
tion of their moisture from the sapwood. Experiments show poles held and seasoned will gain in strength and durability, and checking during seasoning has no particular effect on the strength of the pole. A United States Government report says the number of poles purchased during the year 1906 was 3,574,666, valued at $9,471,171 at point of purchase. These figures do not include poles under 20-foot, used by local lines and for temporary work. The report goes on and says, cedar and chestnut are the principal trees cut for round poles; the sapwood of pine decays rapidly.

An Effective Spark Extinguisher



The problem of preventing the occurrence of fire as a result of sparks escaping from smoke stacks, has always been one of the most vital importance to lumber manufacturers and woodworkers. One scarcely ever reads a newspaper nowadays without coming across an account of a lumber manufacturing plant or woodworking factory being destroyed or seriously damaged by fire. For this reason manufacturers are giving a great deal of attention to this particular problem and it is gratifying to note that, as a result, the demand for an effective spark extinguisher to be installed at the top of smoke stacks has been greatly increased. It is gratifying at the same time to note that to meet this demand, there has been manufactured for some years a practical and satisfactory spark extinguisher. This instrument is known as the "Improved Thompson Spark Extinguisher," which is manufactured by O. V. Hooker & Son, St. Johnsbury, Vt., who have also a splendidly equipped branch for the manufacture of the spark extinguisher at Montreal.

The company have devoted many years of careful study to the basic principles involved in the extinguishing of sparks from smoke stacks, and claim that their extinguisher is the only appliance for the tops of chimneys and smoke stacks that is warranted to extinguish all dangerous sparks without choking the draft. This appliance is not an untried experiment. Hundreds of them are now in use, which have been giving satisfactory service continually for 12 years without a penny for repairs As an indication of the effectiveness of this appliance the company point with pride to the fact that it has proved itself thoroughly satisfactory when applied to wood-burning locomotives, and also to the fact that most of their sales are now traced directly to enthusiastic recommendations from satisfied users of years of experience.

It will be of practical interest to those who contemplate the installation of such an appliance to learn that the lumber underwriters of New York and a number of other companies which insure lumber risks, make a 5 per cent. reduction in premiums on policies issued with a clause containing a guarantee to equip with the "Thompson Improved Spark Extinguisher." When one considers the great amount of fire loss annually occurring in the United States and Canada, it will not be a matter of surprise to learn that the demand for such an effective appliance is rapidly increasing.

The company also make a specialty of designing and installing complete shaving exhaust systems and furnace feed arrangements, handling the material direct from the machines. They have equipped some of the largest plants in Canada, among them being the Canadian Pacific shops at Montreal and Winnipeg. Manufacturers who wish to look into this question closely will be serving their own interests by communicating with the company at their Montreal branch, 337 Craig street west.

Automatic Wood Bending Machine

Defiance Bending Machine

The accompanying illustration represents the patent 12-foot automatic wood bending machine manufactured by the Defiance Machine Works, Defiance, Ohio. This machine has been designed to meet the requirements for bending of felloes for automobile, carriage and wagon wheels, wagon hounds, carriage bows, reaches and other similar classes of bent wood stock. It is capable of bending the lightest felloes for carriage wheels or the heavy work required for farm wagon, truck and artillery wheels, bending hardwood as large as 5 inches thick, 12 inches in width. It is provided with adjustments sufficient to accommodate changes from 13½-inch to 72-inch circles; also wagon hounds to any circle required, and carriage bows from 36 inches up to 44 inches wide. The form for this work is adjustable to bend any widths between the sizes specified.

The frame is a massive casting 9 feet 9 inches high. The floor space occupied is 14 feet long and the greatest width is 6 feet. A foundation of masonry is not required as an average floor, well supported, is sufficient. The machine provides a drastic longitudinal stress upon the timber to be bent, which can be raised to an aggregate of 6,000 pounds. The chain drum is driven by powerful bevel and spur gears. The vertical lever shown is used to control the frictions and start, stop or back down the bender arms. The forms for the bending of felloes are of cast iron, turned true, and with collapsible sections at each end of the arc, to secure the easy removal of the stock after bending. This makes it possible to use stock about 9 inches shorter than can be bent with an ordinary form, which effects a large saving in material. After the operation of bending is completed the machine can be set to run down to the position for the succeeding operation and automatically arrested.

A swinging crane with hoist attached is furnished with each machine, which enables the operator to easily place the forms in or out of the machine. The machine has a capacity for bending about 2,500 felloes 1½-inch, or about 1,200 wagon hounds, in 10 hours. Timber to the amount of 12 inches in width, either in one piece or pieces aggregating that amount, can be bent at one operation. The friction pulleys are as follows: one for running the arms up to 24-inch x 6-inch face; one for running down 18-inch x 5-inch face. The speed of the pulleys is 300 turns a minute. One horse-power is required to drive the machine, and the space occupied is 172 inches x 72 inches x 107 inches high.

Neat and Strong Cross-Cut Saw Handles

Simonds Cross-cut Handle

A new cross-cut saw handle, known as No. 6, which is being marketed by the Simonds Canada Saw Company, Limited, of Montreal, Que.; Vancouver, B.C., and St. John, N.B., is rightly described as neat and strong. The illustration herewith shows the mechanical construction. It is made with malleable iron loop casting, the loop screwing up into a threaded ferrule at the bottom of the handle. The ferrule is made exceptionally strong, bringing liability of breakage down to a minimum. This handle was designed by an experienced woodsman and is so practical that it has met with immediate success, as is demonstrated by a large demand from hardware and supply stores.

Definition of Log Run for Hardwoods

The bulletin of the Hardwood Manufacturers' Association in a recent issue gives a definition of the term log run, which it is hoped will put an end to all the uncertainty which formerly prevailed on this point. The definition is as follows:

"Log run means the full run of the log with all boards excluded that will not cut 50 per cent. into sound cuttings, except walnut and cherry, which allow a minimum of 33⅓ per cent. sound cuttings.

"For further information, we designate to you the woods which are contained under this jurisdiction of the specifications of 50 per cent. sound cuttings and better, minimum cuttings:

Woods	What Log Run Means
Ash	No. 3 common and better
Basswood	No. 3 " "
Beech	No. 3 " "
Birch	No. 3 " "
Buckeye	No. 3 " "
Butternut	No. 3 " "
Cherry	No. 3 " "
Chestnut	No. 2 " "
Cottonwood	No. 2 " "
Elm, soft	No. 3 " "
Elm, rock	No. 2 " "
Gum	No. 2 " "
Hickory and Pecan	No. 3 " "
Maple	No. 3 " "
Maple, soft	No. 2 " "
Oak, plain	No. 3 " "
Oak, quartered	No. 3 " "
Poplar	No. 3 " "
Sycamore, plain	No. 3 " "
Sycamore, quartered	No. 3 " "
Walnut	No. 3 " "

Alex Macdonald, of Winnipeg, in a recent interview predicted a splendid business season for 1910. "We on the prairie," he said, "will take every foot of lumber you can cut. The only trouble is that there are not enough mills in the country to cut as much as we want to buy. We have the money to pay for it, too; last year's 300,000,000-bushel crop has brought an immense amount of cash. Even if this year's crop should be a failure we would still have the money out of what is left over from last year's. One contractor at Lookout told me he would want 12,000,000 feet, and when I mentioned this to a friend here in the lumber business, he told me that he could not touch it, because he had already booked all the orders he could fill."

Burns Saws

A Lumberman from Ottawa Valley writes us as follows:

DEAR SIRS:

The Solid Tooth Saws I purchased from you last spring have been doing first class work ever since. I have never had any trouble with them. The Burns Saws are the best, as they are evenly tempered and will keep an edge longer than any other make of saw used here. Yours truly.

Government Forests of Prussia Well Managed

Prussia has national forests, covering nearly 7,000,000 acres, which are made up much as if the pineries of the Southern States of the United States and the forests of some of the Middle Atlantic and Central States were combined. When forestry was begun by Prussia a great part of the timberland had been injured by mismanagement, much as American forests have been, and the Prussian foresters had to solve the problem of improving the run down forests out of the returns from those which were still in good condition. They solved it with striking success. Immense improvement has already taken place, and is steadily going on.

The method of management adopted calls for a sustained yield —that is, no more wood is cut than the forest produces. Under this management the growth of the forest, and consequently the amount cut, has risen sharply. In 1830, the yield was 20 cubic feet per acre; in 1865, 24 cubic feet; in 1890, 52 cubic feet, and 1904, 65 cubic feet. In other words, Prussian forest management has multiplied the rate of production threefold in 75 years. And the quality of the product has improved with the quantity. Between 1830 and 1904 the percentage of saw timber rose from 19 per cent. to 54 per cent.

It is a striking fact in this connection that in the United States at the present time the people use about three times as much timber as the forests grow. If we were everywhere practising forestry with a resulting improvement equal to that made in Prussia, the forests of this country would be growing as much as we use.

The financial returns in Prussia make an even better showing. Net returns per acre in 1850 were 28 cents. In 1865, they were 72 cents; in 1900, $1.58, and in 1904, $2.50. They are now nearly ten times what they were 60 years ago, and they are increasing more rapidly than ever.

These results have been obtained in Prussia along with almost ideal technical success. When what is wanted is a sustained yield from the forest year by year in the long run, it is clearly necessary to have always a certain number of trees ready to be cut; there must be a proper proportion of trees of all ages. This percentage has been secured and maintained with almost mathematical accuracy.

Seeking New Pencil Woods

Recent conferences of representatives of the United States Department of Agriculture with several lead pencil manufacturers have resulted in plans for testing new woods to find out whether they can be used in the pencil industry. According to some of the manufacturers, the supply of red cedar, which furnishes practically all the wood for the annual output of about 325,000,000 pencils, will be exhausted within five years. A substitute must be found which will whittle easily, which shall contain a large amount of material free of knots, which shall not be porous, nor spongy, nor unduly hard, and which shall occur in sufficient quantities to meet the manufacturers' demand.

In view of this and at the suggestion of the pencil makers, the Forest Service is to co-operate in a test of a number of National Forest woods. Among those to be tried are Rocky Mountain red cedar, alligator juniper, western juniper, redwood, incense cedar, western cedar, Port Orford cedar and Alaska cypress. Wood specimens collected from the National Forests will be sent to four leading manufacturers, who have agreed to make pencils of them. The manufacturers will keep a record of the tests and report to the Forest Service the results, as well as their judgment as to the fitness of the individual woods.

The Forest Service is assisting in this experiment because there are on the National Forests large quantities of junipers and cedars which may be suitable for pencil manufacture. For several of these woods no very valuable use has yet been discovered. Foresters believe that in the future the woods from the National Forests may, to a considerable extent, come into use to supplement the diminishing stock of eastern woods, the supply of which has received no protection.

Alcohol from Sawdust

Replying to a Chicago inquiry asking for information concerning the manufacture of alcohol from sawdust in France, the quantity of such material available, and the prospect of a sale in that country of a newly invented American process for that purpose, Consul-General Frank H. Mason, Paris, reports as follows:

Very little timber or lumber is sawed in or near the forests of France, so that the supply of material for such a process would be limited and expensive. Apparently, the only establishment for the manufacture of alcohol from sawdust is at St. Marcel, in the Department of Ardeche, in the south of France, not far from the Mediterranean. It is a new, up-to-date concern and employs a highly improved process of an inventor of Aix la Chapelle, which consists in exposing sawdust to sulphurous acid gas, whereby a chemical action is induced which enables the alcohol to be generated and extracted without being mixed with or contaminated by the sulphur, as had always happened when sawdust was macerated in a solution of sulphuric acid upon the older processes. Consequently, it is claimed that wood alcohol made by the new process can be drunk or used for any other purpose to which pure alcohol is usually applied.

One metric ton (2,204 pounds) of sawdust yields by this process 100 liters, or 27.47 gallons, of alcohol, 20 kilos (42 pounds) of acetic acid, and the residue of spent sawdust is pressed into briquettes and used for fuel. Consequently it is claimed that the process is very profitable. The process is patented, of course, in France and the United States.

Aristocrat of the Hardwood Trade

When poplar trees standing nine miles from a railroad in a rough and hilly country, and 35 miles from the mill which is to saw them, sell for $150 per tree, cash, just as they sand, the yellow poplar has certainly become the aristocrat of the hardwood trade. It is said that the manufacturers of automobiles, after fully experimenting with metal bodies, show a disposition to return to wooden bodies. The objections that have developed in metal bodies are said to be the difficulty of eliminating the noise from vibration, and the difficulty of patching up partial fractures and abrasions. When a poplar body of an automobile has been smashed up in a wreck, it is comparatively an easy and simple matter to patch it up, as good as new, but when a pressed steel body is smashed out of shape it has to be replaced with a new one. Even slight abrasions are said to be much more easily repaired on the wooden body. The further claim is made that with the wooden body there is no noise resulting from vibration.

Review of Current Trade Conditions

Ontario

There is little of interest to note in the condition of the lumber business in Ontario. The improvement which was expected after the settlement of the tariff issue has not materialized to any extent. In fact, trade has, if anything, been duller since that time. The demand from the United States has become somewhat less encouraging. Occasionally one hears a suggestion that an effort was made during the last few months to bring about a trade recovery too rapidly and that we must wait patiently for a complete return to normal conditions. Throughout Ontario there is a fair amount of activity as a result of the increased building operations, but the retailers are pretty well stocked up and the increased building does not, therefore, have much effect upon trade for wholesalers or manufacturers. Shingles are reported to be stiffening a little. XXX British Columbia are quoted now at $3.20, but it is doubtful whether this figure is often secured, the old figure of $3.10 being much nearer the actual price.

Mills in the Ottawa valley commenced operations this year about a week earlier than last year and are now in full swing. A number of the mills gained a couple of weeks as compared with last season. The indications are that there will be a heavy cut, as there is a good outlook for the log supply and it is believed that the Ottawa river will be comparatively free from floods this year. During the month of April there was a very satisfactory activity in the lumber trade at Ottawa, a good many transactions having taken place among the high grades of white pine at top prices. If manufacturers had not been so confident of the future there would have been much more business than there has been, but they have had no hesitation about holding their stocks. Prices have remained very firm and owners have been able to dictate their own financial terms. It is expected that the present high prices for 2-inch sidings, shorts and strips will be advanced, as many of the manufacturers are holding out. An advance of $8 per thousand over the price a year ago was secured a few days ago on a large scale for good sidings 2 x7 and up. There has been an improvement in the demand for all stock better than "box" since the settlement of the tariff issue. Mill culls and dead culls are being disposed of gradually as a result of the good outlook for the building season. Lath are scarce in the Ottawa valley. New stock is in good demand. No. 1 white pine is selling at $4 per M., and No. 2 at $3.25. These prices are 50 cents higher than a year ago.

Eastern Canada

The outlook for the drive on the various rivers of New Brunswick is far from promising and is growing less so as the season advances. Stream driving commenced very early and the lack of rain and gradual disappearance of the snow have resulted in an inadequate volume of water in most of the rivers. It is almost certain that large quantities of logs will be hung up on the St. John and its branches. On the Miramichi and its branches similar difficulties are being experienced. The opening of the manufacturing season at St. John has been marked by a strike among the mill men, who demanded a 10 per cent. increase and, being refused, ceased work without notice. The strike only applied to the Stetson, Cutler mill, which was the only one operating. It was expected, however, to spread to the other mills as soon as they attempted to commence operations. It is difficult so far to foretell what the result of the situation may be.

Bank logs are somewhat cheaper than they were a year ago, bringing $12.50 for deal logs, $10 for battens and $8 for hemlock at St. John and Fredericton.

There is greater firmness in the spruce market at Boston and buyers are becoming quite active. Frames are selling freely at $24. Sometimes $24.50 and $25 is secured for very prompt shipment. The market for random has also firmed up. Sales of 2 x 8 are reported at $22, and business has also been done at 50 cents less than this price. Large sizes are selling well at $23.50 to $24, and there is also a good demand for smaller sizes. There is a more active market for boards and prices are firmer. At New York, the demand for eastern spruce is quite active. Reports all indicate a smaller output this year. There are plentiful stocks, however, of low grades. There are plentiful offerings of shingles at Buffalo. The best cedar extras are quoted at $2.40 to $3.50, but there is not much business at the outside figure. The outlook for lath is improving. The price for 1⅝-inch is ranging from $3.85 to $3.90, and for 1½-inch from $3.50 to $3.60.

Western Canada

The lumber trade in Western Canada is looking forward to a record season, as a result of the good demand expected from the prairies and from the railroads. The shingle market is looking better than for some time, the base price being $2 for No. 1 grade. Since March 31st, when the tariff questions were settled, the shingle market in the United States has decidedly stiffened. Some of the British Columbia mills are shipping, and expect to be shipping right along. It is true the extra 20 cents duty made a difference in the trade, still the prospect is by no means disheartening. On the other side of the line the cost of production has gone up, while in British Columbia manufacturers have been able to hold their own. The price of bolts is about $5.25. Several large orders from the Canadian market were received recently, and the coast market, while not extensive, is steadily getting better.

Reports from Vancouver state that the lumber industry never had a brighter prospect than at present. The demand from the prairie provinces is excellent. The shingle market is looking better than for some time, the base price being $2 for No. 1 grade. There is much activity in the logging industry in British Columbia and many new camps are opening up. The demand is good with prices running from $10 to $10.50 for the good quality of fir and $7 to $9 for the poorer qualities, delivered at Vancouver. Cedar logs are in poor demand with the exception of No. 1, which are selling at $10, delivered. The lower grades bring from $8 to $8.50.

Great Britain

There is a fair amount of lumber going into consumption at London but in spite of this trade is not at all brisk. Buyers of deals and battens are fairly active, as they find that they can do better by making their purchases now than by waiting for fresh arrivals. It is believed that it will not be an easy matter for importers to make profits on the new level of prices which must be charged for this year's purchases. Prices for deals and scantlings are still steady but floorings are a little easier. The building trade is rather quiet but there is a fairly good demand from the packing case trade. At Churchill & Sim's recent auction sale, 3x11 3rd Quebec spruce sold at £10, and 3 x 7 unsorted bright Quebec spruce brought £8 10s. The timber ponds in the Surrey Commercial Docks are looking very bare. Stocks of pitch pine in the London docks are moderate. There is a fairly heavy stock of Oregon timber, but it is being rapidly reduced to meet the requirements of a new battleship being built on the Thames.

At Liverpool, the trade is very dull, wholesalers complaining of being unable to do any business on a large scale. Some of the large importers are, however, making their contracts for future delivery with

Why Not Have the Best?

To hold the confidence of your trade you must be able to back up all your statements with the goods, and that's where we can help you out. When you want anything in White Pine, Norway or Fir—and want it right—let us have your order. We can furnish any length from ten to sixty feet.

If there is anything on earth we pride ourselves upon, its the prompt way in which we fill orders.

Cleveland-Sarnia Saw Mills Co., Limited

SARNIA, ONTARIO

much more confidence than the smaller importers. The smaller liner shipments from St. John, N.B., have been sold from the quay at current prices. A large number of transactions have recently been made by New Brunswick shippers in the Liverpool district and also at various coast points, on the basis of £8 5s. per standard c.i.f. for about 70 per cent. of 3 x 7 and 8, balance wider. These figures apply both to St. John and Miramichi districts. Stocks at Liverpool are considerably diminished, especially in the favorite dimensions. The spot spruce market at Liverpool has a steady demand but the supply is plentiful. Parcels arriving by liners are going almost direct into consumption. Spot values are advancing all around, but are not quite in harmony with the c.i.f. values.

The c.i.f. market for birch planks at Liverpool is very firm and further advances are not unexpected, but the spot market, though a little better, is not as strong as it might be. Stocks are only moderate and the demand is improving. Stocks are mostly composed of 3-inch planks with a proportion of 4-inch and a few 2-inch, but 2½-inch are very scarce and are selling at as high as 10s. per standard above the other thicknesses. There is much better demand for birch logs and both c.i.f. and spot values are firmer. Pitch pine is dull. There is no important change to note in the market for Quebec pine although the spot values for higher grades of sidings have advanced. There is a poorer demand for first quality deals, especially in narrows. Second qualities are also firm. The demand is not encouraging. Stocks are fairly ample. Quebec red pine is in much better demand and is being used extensively in place of yellow pine lower grades.

United States

Reports from Chicago state that the demand from the local yards continues fairly active and that the favorable weather has assisted in the increase of building operations. Northern pine at Chicago is in fairly good demand for factory stock. All stock of No. 2 and better is firm. The lower grades are somewhat dull. Hardwoods at Shicago continue very active. Plain oak is still scarce and quartered white and quartered red oak are easily disposed of at steady prices. Basswood is a little easier and hardwood flooring is strong. Hemlock at Chicago is in good demand. Stocks of this year's cut are not expected to be as heavy as those of last year and contracts covering a large portion of this season's cut have already been made. The consumption of fir, spruce and cedar is increasing at Chicago. Spruce siding is selling actively. Prices of all Pacific coast woods are considerably improved as compared with a year ago. There is a fair amount of activity in shingles at Chicago and prices are steady. Washington red cedars are offered at $3.47 for "Clears" and $2.89 for "Stars," a shade weaker than a week ago. Lath continues scarce in all varieties and prices are firm.

At Buffalo, the prices of high grade white pine are strong, though the lower grades are somewhat dull and weak. It is reported that many other classes of wood are being substituted for white pine. There is a good demand for hardwoods and it is expected that quartered oak will become even firmer on account of the scarcity, sometimes chestnut and plain oak being substituted for quartered. Birch is scarce and the demand for elm, maple and basswood is good. The demand for hemlock at Buffalo is quite active but stocks are plentiful. Canadian dealers are finding the prices too low to enable them to pay the duty and obtain profit. Southern pine at Buffalo is reported to be fairly strong and there is an active demand, especially for timbers. Shingles at Buffalo are reported to be rather weak, but it is believed that the prices will not decline, as the Pacific coast mills are holding a firm position.

Market Correspondence

New Brunswick Drive Conditions Growing Worse

Chatham, N.B., April 23.—The great, outstanding feature of the trade and industry of this province at persent writing are the prospects, conditions and progress made in connection with the log drives. The situation in this connection has been growing more unfavorable for several days past and lumber manufacturers and others who are in any way interested, are growing daily more anxious.

Stream-driving on the St. John river began about the 10th inst., the earliest date for the opening of the driving season during the last quarter of a century. At that time, it was hoped that, if the warm weather continued there would be plenty of snow to give a good volume of water for driving purposes, but the weather, since the first warm spell, has been cold and backward and the snow has melted very slowly and gradually, causing no really useful volume of water. This, together with an entire lack of rain, has caused conditions to grow less favorable day by day for the past week.

On April 15th reports from the headwaters of the St. John stated that the water had fallen two feet during the preceding fortnight. In one night the water fell eight inches at Woodstock. On the 16th it was reported that on several branches of the St. John the water was so low that the driving crews were obliged to cease working entirely. On the Nashwaak river, where the Gibson Company's drives are located, the water is also reported to be falling. On the Tobique, where a number of St. John manufacturers operate, work has practically ceased.

There is still considerable snow in the woods at the head of the St. John, authentic reports to lumbermen from their contractors stating that the quantity ranges from two feet on the Tobique to three feet and even three and a half feet, on some of the further up-river branches of the St. John.

On the whole, the outlook for the drives on the St. John is the reverse of promising. Unless there are heavy falls of rain very shortly, it is almost certain that there will be huge quantities of logs hung up on that river and its branches.

On the Miramichi conditions somewhat similar to those on the St. John are prevalent. The water in the brooks and streams is very low and such crews as are working are finding it very difficult to make any progress with their logs. There is here, also, considerable snow in the woods, but it is melting gradually and heavy rains are needed to make a sufficient head of water. On the Tabusintac—a branch of the Miramichi—there is about two feet of snow still in the woods, but the water is so low that, in some cases, the logs have not yet been put into the stream.

St. John, always first to be affected by labor troubles, is threatened with a strike among the millmen this year. Stetson, Cutler & Company started their Indiantown plant last week after a season of idleness of some weeks' duration. The men had been working only a few days when they demanded an increase of 10 per cent. and, this being denied them, they quit work without notice. The rate of wages at all the mills is uniform and there is a great deal of free-masonry among the men, although they are not generally organized. It is, of course, understood that the action of Stetson, Cutler & Company's crew is merely the initial step in a general strike and that none of the men at the other mills will go to work at the old rate of wages. None of the other mill owners have as yet made any attempt to start, all the mills having been closed down for the past two months.

Perhaps there is no place in the Dominion where it is so hard for the employers of men to get together and make terms as in St. John. The tendency on both sides is to fight to the bitter end. An instance of this was the strike of 1908, when the shingle sawyers and bunchers went on strike when a demand for a 10 per cent. increase of wages was refused. With "extras" selling in Boston at the hitherto unequalled price of $4 per thousand, the mill owners refused to give in, and St. John's output of shingles that year amounted to perhaps four millions. The mill owners won in that case, and also in a general strike among the mill hands about four years ago, the latter strike lasting only a few days. The sentiment is similar to-day to that which characterized the strike among the shingle crews in 1908 and the results of a general strike are hard to predict.

Bank logs are somewhat cheaper this spring than was the case a year ago. The prevalent figures at St. John and Fredericton are $12.50 for deal logs, $10 for battens, and $8 for hemlock.

Ottawa Mills all in Operation

Ottawa, April 26—Lumber manufacture is in full swing in the Ottawa valley. Shepard & Morse began operations on April 12th, or a week earlier than last year. Two days later J. R. Booth started a day gang, which gives him a fortnight's advance on 1909. The W. C. Edwards Company opened its Rockland mill on April 15th with 700 men, and launched the season's work in Ottawa on April 18th, adding 200 more men to the staff. The Hawkesbury Lumber Company are running with 800 men. The James MacLaren Company, of Buckingham, opened on April 20th, and Fraser & Company on April 25th. An average of two weeks is gained on last season with the lumber manufacturers at the outset. There is also the most favorable outlook as to log supply and freedom from floods when the north waters come down. J. R. Booth has over 100,000 logs in the mill pond already, which will be sawn as soon as the gum leaves them. W. C. Edwards Company and Shepard & Morse report logs plentiful and the Upper Ottawa Improvement Company is in good shape to conduct an expeditious drive.

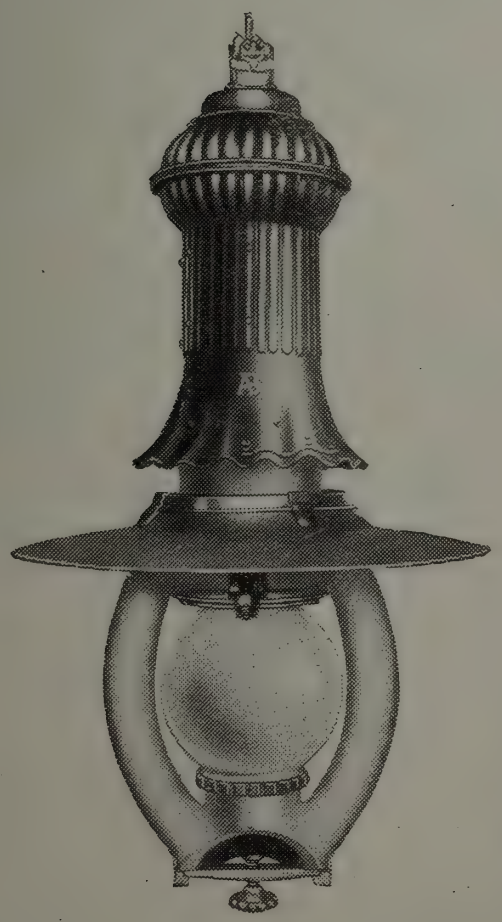
Fraser & Company, of Descsênes, who last year cut 8,000,000 feet for Shepard & Morse, have to handle a large lot of logs bought from Bryson & Campbell for themselves this year, and will not be able to contract for outside sawing so early in the summer. The Shepard & Morse mill is equipped with two double cut band saws of the Waterous Engine Works Company, and will turn out more than the usual quantity of lumber. Still the firm have more logs than they can handle, and will let contracts to both Fraser & Company and Ritchie Bros., of Aylmer.

Negotiations are in progress with the James MacLaren Company, of Buckingham, presumably by an American syndicate, for the purchase of the MacLaren mills. The MacLaren people are large manufacturers of lumber and pulp. They ship all by rail. The mill has recently been furnished with up-to-date labor-saving machinery.

Lumbermen are figuring up heavy losses caused by the early cessation of bush work. Usually in the northern parts log making continues

Camp Supplies

TO the lumbermen we wish to point out our superior advantages for supplying all the requirements for the provisioning of the Camp.



We have made a specialty of this kind of business for years and can confidently ask for your orders in the fullest belief that we are in a position to handle them to your entire satisfaction.

Good strong quality serviceable black, mixed or green tea 14 1/2 cents.

J. R. Baxter & Co.

Mill Supplies :: MONTREAL

till the end of April. This year, however, the break up in March was the signal for suspending work in the woods and sending river drivers to the upper waters. The majority of these men were kept a month waiting for the drive to get well started. In fact, in many parts the drive will not be any earlier than in ordinary seasons. The situation is peculiar on the upper Ottawa. Lake Temiskaming has been open since the middle of April, while the small streams which usually are free from ice first are still frozen over. All the lakes in the Matabituan district are ice bound. The drive on the Montreal river did not open till April 15th. Employment agents in Ottawa report the labor market very brisk for river drivers. The exodus to the west of experienced river men is noted and many of them also have employment in railway construction. The tendency of wages has been upward for river drivers, although mill hands have taken their places at the rates current a year ago.

The month of April has witnessed a good many transactions in lumber at the top prices quoted for high classes of white pine. There would have been much more business but for the confidence of manufacturers in the lumber outlook from their standpoint. While prices did not undergo fluctuations, holders of lumber could afford to make their own terms in financial arrangements. There is everywhere an evidence that manufacturers are not afraid to hold lumber. Two-inch good sidings, shorts and strips are likely to pass the present stiff quotations. This conclusion is drawn from the fact that many of the manufacturers, most likely to be well supplied, are sold up. A large sale of good sidings, 2 x 7 and up, was made the other day at an advance of $8 per thousand on what a similar transaction showed exactly a year ago. All stock better than box has stiffened since the settlement of the tariff issue with the United States. Middlemen believe the mill culls and dead culls are working off gradually and that with a good building season and moderate transportation rates on water, the surplus in the Ottawa valley will be depleted. Some Canadian bottoms are being loaded already and American boats will be on hand for cargoes by the first of May. Ottawa lumbermen have heard from indirect sources that cull lumber is strengthening in western Ontario.

Rarely at this time of year has lath been so scarce. The new stock is in brisk demand and No. 1 white pine is firm at $4 per thousand. No. 2 brings $3.25. Quotations are 50 cents higher than in the spring of 1909.

The advances in Ontario timber dues will be discussed by the lumbermen in a body. In one quarter the "Canada Lumberman" learned that a prominent manufacturer would seriously criticize the Governments of both Ontario and Quebec for increasing the tax on Canadian manufacturers. It is claimed that the market advances of the last year have been fully justified by the increased difficulty in getting out logs, rise in wages, higher cost of shanty supplies, insurance rates, etc. The average hire of a shanty man is said now to be $22 a month, as compared with $16 a decade ago. Pork is quoted now at $14 per cwt. in Ottawa. It was half that price ten years ago and horses and their fodder are from 40 to 60 per cent. dearer. It is claimed that the buoyant market is only for the very best quality of lumber and that the legislators who are fixing the tariffs on the producers should not forget that inferior lumber is often put on the market at a loss. At the lumbermen's meeting there will be also a strong defence of the action in advancing the provincial rates.

Messrs. C. J. Booth, Peter Whelen, C. E. Read, W. McLaughlin and other local lumbermen declined to give views for publication until the effect of the increases are better realized.

The Perley Lumber Company will not open their mill at Calumet until all danger of the flooding from northern waters is passed. Other seasons the company had to close after gathering their men, and difficulty was experienced in getting them together again. The heavy April rains are expected to swell the streams. The downpour so far has been heavier than in 1909. March of the present year afforded only an inch of rain in the Ottawa valley and 4½ inches of snow, as compared with 2 inches of rain and 24 inches of snow in 1909.

The National Rag & Paper Company, which was recently formed by J. F. Booth, William Anderson, H. K. Egan, W. S. Dwyer, all of Ottawa, and J. W. Hennessey, of Fort Coulonge, with a capital of $200,000, are considering the erection of a factory in Ottawa or farther down the river. The company is authorized by Dominion charter to go into the manufacture of pulp, paper, etc., in all branches, hold limits, develop electrical power and such like.

Senator W. C. Edwards and Gordon C. Edwards are associated with two Americans in the formation of the Canadian Mahogany Company, capitalized at $200,000. The office will be in Ottawa.

About $1,400 worth of lumber was destroyed in the Shepard & Morse yards on April 12th. The loss was so small compared with the possibilities that the company rewarded the efforts of the Ottawa firemen with the gift of a $100 cheque.

The United States Treasury Department has decided that in future, customs duties assessed on mechanically ground wood pulp made from pulpwood, cut on private lands in the provinces of Ontario and Quebec, will be refunded. A large number of entries made at Plattsburg, Niagara Falls, Buffalo and Ogdensburg are affected by this rule.

For Sale to Close an Account

Crown Granted Timber Limits and Lands

in the

Province of British Columbia, Canada

The undersigned has received instructions from the owners who desire to close the account, to sell by private treaty

Forty Timber Limits and Lands

situate in the Salmon River Valley, West Kootenay, British Columbia, from thirty to forty-five miles north of the United States border, and upon, or contiguous to the Nelson and Fort Sheppard Railway which runs between Spokane, Washington, and Nelson, British Columbia, connecting with the Great Northern and Canadian Pacific Railways, and affording access to the United States and Canadian markets.

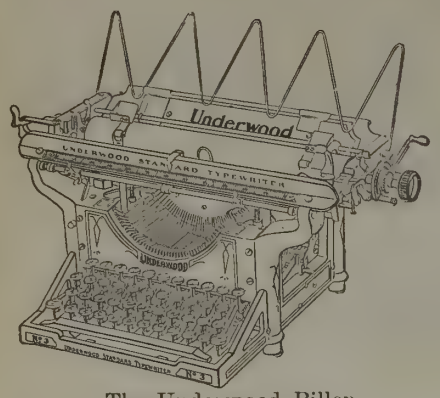
The limits contain in the aggregate thirty-eight thousand acres, and are comprised of bottom lands and benches of hills, constituting one of the best bodies of timber in the Central Southern part of British Columbia. Subdivision of the tract has hitherto been consistently refused. Individual limits contain from two hundred and fifty to twenty-one hundred acres, with from three million to forty-five million feet of Cedar, Pine, Hemlock and other woods of excellent quality upon them, in addition to large quantities of Cedar Poles—prices run from $5,000 up according to Stumpage and Location.

Some of the limits are essentially Cedar Pole Propositions, and contain large quantities of the very best quality of Cedar Poles from twenty-five to seventy-five feet in length, free of limbs.

The properties are Crown Granted, and the timber upon them may be exported. The Timber is subject to a Royalty of fifty cents per thousand feet, when cut.

A considerable quantity of the land is available for fruit land when cleared, and the owners are prepared to give a deed of land and timber, or a license to cut timber only for a term of years, at the option of the Purchaser.

TERMS OF SALE:



In order to close the account, very easy terms of purchase will be given, namely, twenty-five per cent. cash, and the balance in four equal annual instalments, and twenty per cent. cash with balance in six equal annual instalments—interest at six per cent.—with operating privileges which will assist purchasers to pay for limits out of stumpage.

The character of the properties together with the easy terms of payment present a unique opportunity to persons of moderate means to acquire valuable limits for either operation or investment.

Prices and further information may be had upon application.

EDGINGS

Ontario

Jonas Grant, sawmill proprietor, Maynooth, Ont., is advertising his business for sale.

Leslie's planing mills at Mount Forest, Ont., were recently destroyed by fire, together with several piles of lumber.

Fire recently damaged the lumber yards of Shepard & Morse at Ottawa to the extent of $2,000. The lumber burned amounted to about 100,000 feet.

It is reported that the Hon. Adam Beck's box manufacturing company, London, Ont., will establish a branch at Winnipeg and also that they will enlarge their factory at Montreal.

The Ball Planing Mill Company, Limited, Barrie, Ont., have been incorporated; capital, $75,000. Incorporators: W. Gallie, J. D. Rodgers, Thomas Gray, and G. Rodgers, all of Barrie.

Excelsior, Limited, Toronto, have been incorporated with capital of $150,000, to carry on the business of manufacturers of wood fibre, lumber, etc. The incorporators are: J. A. Manning, Owen Sound, and G. Howard, Toronto.

Messrs. E. P. Foley and Herman Riegar, of Niagara Falls, N.Y., will establish a new paper mill at Thorold, Ont. Only pulp will be manufactured at first, but subsequently the company will manufacture various qualities of paper.

The office of the Hamilton Lumber Company, Hamilton, Ont., was recently entered by burglars at night and the safe was blown open by dynamite. Fortunately there was only $28 in money in the safe, but the damage to the safe itself amounted to about $125.

Messrs. Atkins & Hardy, of Owen Sound, Ont., have let contracts for their new factory for the manufacture of wood fibre. The building will be of concrete, 40 x 60 feet, and machinery of the latest type will be installed, which will be driven by electric power.

The Taplin Timber Company, of Toronto, have commenced the erection of a large sawmill on the shore of Lake Sasaginaga, near Cobalt. The machinery, boilers and equipment are already on the spot. The company control a tract of virgin timber about four miles square lying north of the lake.

The Canadian Mahogany Company, Limited, Ottawa, Ont., have been incorporated with capital of $200,000, to carry on the business of saw millers, planing, etc. The incorporators are Hon. W. C. Edwards, G. C. Edwards, Ottawa; W. A. Hall, New York, and W. B. Chisholm, Charleston, Cal.

The Rat Portage Lumber Company started their mill at Kenora, Ont., on Monday, April 18th. A number of improvements were made during the spring and the delay in starting the mill was due to the arrival of some of the new material. The company have a large quantity of logs on hand for the summer's work.

Messrs. Seaman & Kent, of the Seaman-Kent Company, Dyers Bay, Ont., have selected the site for their new hardwood finishing plant at Fort William. The site is on the Mission river a short distance below the turning basin. Building operations are expected to begin at once. The company will handle all their western business from the Fort William plant.

On account of the shortage of the log cut in the Fort William district of Ontario some of the companies will carry on a considerable amount of logging this year. The winter weather broke up about 30 days earlier than was expected and many millions of feet of logs were left on the skidways. The demand for lumber in that district is reported to be steadily improving, especially for the low grade stock.

Negotiations have been in progress for some time between the Swedish-Canadian Lumber Company and the Curran Bros. for the purchase of the latter's large mill and their extensive timber limits on the Kouchibouguac river and tributaries; also the cut of last winter. It is understood that the deal has been completed and the property duly transferred. The price is kept private but is said to be in the vicinity of $60,000 or $70,000. This mill, which was formerly owned by the Jardines, is one of the largest and best equipped on the North Shore.

Lumber manufacturing will not be quite so active at Midland this year as formerly. There will, however, be a considerable quantity of lumber turned out at that place. James Playfair's mill has undergone the usual repairs and started about April 15th with a season's cut. Chew Bros. also completed their spring overhauling and started sawing the third week of April, with a full season's stock. Manley Chew made a late start and was expected to have rather a short run. N. L. Playfair will not operate and his former employees have secured situations elsewhere.

The Bryan Manufacturing Company, Collingwood, Ont., have prepared plans for the extensions which they propose to make to their premises, in order to handle their largely increasing business. A new dry kiln will be erected, which will be a brick building 30 x 130 feet. The contract for the equipment of this building has been given to the Sheldon Manufacturing Company, of Galt, Ont. In the fall the company expect to erect a second factory to be constructed of brick, and to be 66 x 240 feet. Their plans also include a new office building, the erection of which, however, may be deferred until the dry kiln and the factory are completed.

The National Timber & Pulp Company, Limited, of Toronto, which was recentl yorganized with an authorized capital of $500,000, is composed of W. P. Sherwood, A. E. Matthews and other Toronto gentlemen who are backed by English capitalists. It is reported that in a short time the capital will be increased to $3,000,000. The company now own a timber limit in Quebec and hold options on three other important adjacent limits. The limits comprise about 416,000 acres, of which 106,000 is freehold. They are located in Cap Chat, Tourelle, Christie and Gaspe counties, and are well watered by the Ste. Anne, Marlin, Mansivie, and other tributaries of the St. Lawrence. The limits already owned contain about 350,000 cords of pulpwood, and upon those which are under option there is an equal quantity, making some 700,000 acres in all. It is the company's intention to erect a large pulp mill at the junction of the Ste. Anne and St. Lawrence rivers. On the property which is under option there are two well equipped sawmills, turning out 60,000 feet a day, and a shingle mill, all of which are in operation. The company intend to erect another sawmill of large capacity on the property they already own. The executive offices will be in Toronto.

Eastern Provinces

The Canadian Woodenware Company, Limited, formerly of Hamilton, Ont., will establish a factory at South Bay, N.B. Their capital stock is $50,000.

A. Palmer & Company, planing mill proprietors, Charlottetown, P.E.I., have been succeeded by the MacDonald-Rowe Woodworking Company, Limited.

The export of lumber from St. John, N.B., to transatlantic ports for the first quarter this year amounted to twenty million feet, or about two million less than for the like quarter last year.

Mr. M. M. Beeton, president of the Anglo-Newfoundland Development Company, Limited, of Grand Falls, Nfld., recently stated that by the end of April his company would be turning out 80 tons of paper and three tons of wet ground wood pulp daily.

Nearly all the pulp mills in the Quebec district are preparing to make substantial increases to their output, in view of the increased demand which is expected as a result of the Government's action in prohibiting the export of unmanufactured pulpwood cut on Crown lands.

An American syndicate is reported to be negotiating for the purchase of the McLaren mills at Buckingham, Que. The syndicate intend, if the deal is put through, to conduct the business on a much larger scale and to establish a fast shipping service to New York and other large American cities. The transfer would involve about $2,000,000, as the McLaren Company own large timber limits. The present owners would be shareholders in the new company, and it is reported that if the deal is put through it will give employment to some 2,000 additional men.

Lumbermen from Three Rivers and the St. Maurice report that the winter was very favorable on the upper tributaries of the St. Maurice river, as the snow came early in sufficient quantities to enable them to continue their operations for several months. Despite this, the cut is somewhat smaller than usual. Several of the large companies had tens of thousands of logs stranded in the streams last spring, owing to the scarcity of water at the right time. These stranded logs will be brought down this spring, and will keep the mills in operation for a considerable portion of the summer.

Western Canada

The Fort George Lumber & Navigation Company, of Vancouver, B.C., will shortly enlarge their plant.

Negotiations are in progress for the sale of the Huntting Lumber Mill at Vancouver, B.C., at a price of $220,000.

The Pacific Coast Lumber Mills, Limited, have sold their mill and stock to the British Canadian Lumber Company, Limited.

The Westholme Lumber Company, Victoria, B.C., will shortly commence to build a three-storey store and warehouse costing $44,000.

Messrs. Dickenson & Scott, of New Westminster, B.C., have almost completed the erection of a new sash and door factory at North Vancouver. The factory is being equipped with the latest types of machinery for the manufacture of interior house finishings.

The Great West Lumber Company, of Red Deer, Alta., report that they have secured the largest and best cut of logs in their history, amounting to over 4,000,000 feet. It is expected that the sawmill at Red Deer will be run with day and night shifts this season.

A timber berth containing 683 acres on Lillooet lake, B.C., was sold by auction recently at New Westminster. Crown Timber Agent Leamy acted as auctioneer, and $14,100 was realized—or something over $20 per acre. The buyers were the Adams-Powell Timber Company, of Vancouver.

The A. R. Rodgers Lumber Company, at Enderby, B.C., will operate their mill both night and day during the present season, and will cut at least 20,000,000 feet. Extensive improvements have been made to the mill, two carloads of machinery having been installed during the last two months.

Mr. John Hanbury's new mill at False Creek, B.C., will be operated by electricity. The contract has been awarded for a 500 kilowatt turbine generator with 15 motors, which will develop 600 h.p. The plant will have a capacity of 100,000 feet daily, in addition to the output of the sash and door factory.

The revenue of the Crown Timber Office at New Westminster, B.C., for the fiscal year ending March 31, was $122,763; an increase of $73,976 over the revenue for the previous year. This is the largest revenue received by the office in its history and is twice as large as that of any year previous to last year.

Mr. J. S. Emerson, of the Emerson Lumber Company, Vancouver, B.C., who has just returned from a business trip to the Fiji Islands, states that he considers the action recently taken by the Government in cancelling his licenses for alleged illegal export of timber was high-handed and unjustifiable. He says that the last has not been heard of the matter and that he will take steps to have the cancellation revoked.

The Pacific Coast Lumber Company, Vancouver, B.C., have sold 4,00 acres of timber limits in the Squamish district, near the head of Howe Sound, to Captain Magneson and Messrs. Mackinnon & Norton, of Vancouver, for $125,000. The timber consists of fir of excellent quality. The leases were issued 17 years ago and have 13 years to run. The new owners will build four miles of standard gauge railway to the limits.

A deputation representing the British Columbia Loggers' Association have asked the Provincial Government to remove the prohibition of the export of unmanufactured timber to the United States in so far as rough cedar for manufacture into shingles is concerned. British Columbia shingles could no longer go into the United States at a profit, it was said, because of the increase of the United States duty, and the deputation wanted to secure some of the benefits of the shingle business by exporting the shingle bolts.

A number of Vancouver, B C., and Bellingham, Wash, capitalists have undertaken a project to establish a line of sailing vessels between Vancouver and the Fiji Islands, carrying British Columbia fir and cedar, and returning with hardwood. Among those interested are J. S. Emerson, Vancouver; J. W. Bell, Vancouver; B. W. Loggie, Bellingham, and J. Warren Bell, of Suva, Fiji Islands. A mill will be started in Vancouver for the manufacture of Fijian hardwoods into sashes, doors, interior finish and veneers.

During the month of February the output of logs on the coast of British Columbia was 250 per cent. greater than during the corresponding month of 1909. March and April also kept up with this record. During February and March the output was 40,000,000 per month. In February, 1909, the cut was 15,000,000 feet; in February, 1908, 14,000,000 feet, and in February, 1907, 12,000,000 feet. It is understood that the great increase is a result of the large companies adopting the use of standard gauge railways and the latest types of logging engines.

PRINCIPLE—NOT "POLICY"

We never make a change in methods, processes or treatments to save money—unless the change *improves* our *product*.

If a change *will* improve our product, we never hesitate an instant because the new way costs money.

We have invented or developed nearly all important processes of modern saw-making —we are and for seventy years have been *first* to adopt and utilize every improvement brought forth by science, human ingenuity or the progress of events.

We have always found that although improved methods may seem slow or difficult or expensive at first, they invariably work out faster, easier and more economical.

It's to your own advantage to associate yourself in a business way with an industrial organization which is guided in all things great and small, by the highest purposes, motives and ideals.

Every Disston Saw, File and Tool has back of it the absolute guarantee of one of the greatest business institutions in America.

Cost Reduction

Business men everywhere are giving attention to reducing cost of manufacturing by installing labor-saving and time-saving tools.

The Shimer Cutter Heads remove many of the troubles and worries incident to the business of the machine woodworker and place in his hands the power to increase his productive capacity in the manufacture of flooring, ceiling, siding, wainscoting, door and sash patterns, etc., besides saving much of the material that formerly reached the offal pile.

Examine our catalogue and see if there is not some tool you need to help in the work of cost reduction. If your work is special write us about it. Almost every week we adapt the Shimer Cutter Head to the making of Specialties, or design some new fixture to further its usefulness.

We make a number of Heads for special purposes. For any design of material you get out in quantity let us give our estimate on the Head to do the work. Our prices are uniformly low—our goods of best quality.

The dealer who accepts your order for the Shimer Cutter Head and supplies you with another means to deceive you in no small matter. Look for the Name and Trade Mark "The Shimer Cutter Head" stamped on every genuine tool. Any other is spurious—send it back—demand the genuine, of quality and helpfulness, with a record of 40 years of upbuilding and improvement. It costs no more.

Branch of Milton, Pa. **Samuel J. Shimer & Sons,** Galt, Ontario, Can.

Hanchett Band Swage

Filers! Mill Men!

Success in lumbering depends upon the extra large cuts over the regular cuts, and turning out better lumber. In other words it is turning out more lumber at a less cost. Now our specialty is labor saving machinery for the care of saws. We manufacture all kinds of machinery and tools for the care of saws. One of our best tools is our Hanchett Swage. This tool presses the tooth widest on face, widest at extreme corners, and tapers the tooth downward and backward. Our swage shaper then presses the tooth to an ideal shape and each tooth exactly alike thus doing away with a great deal of filing and making a stronger and better cutting tooth.

Hanchett Swage Works

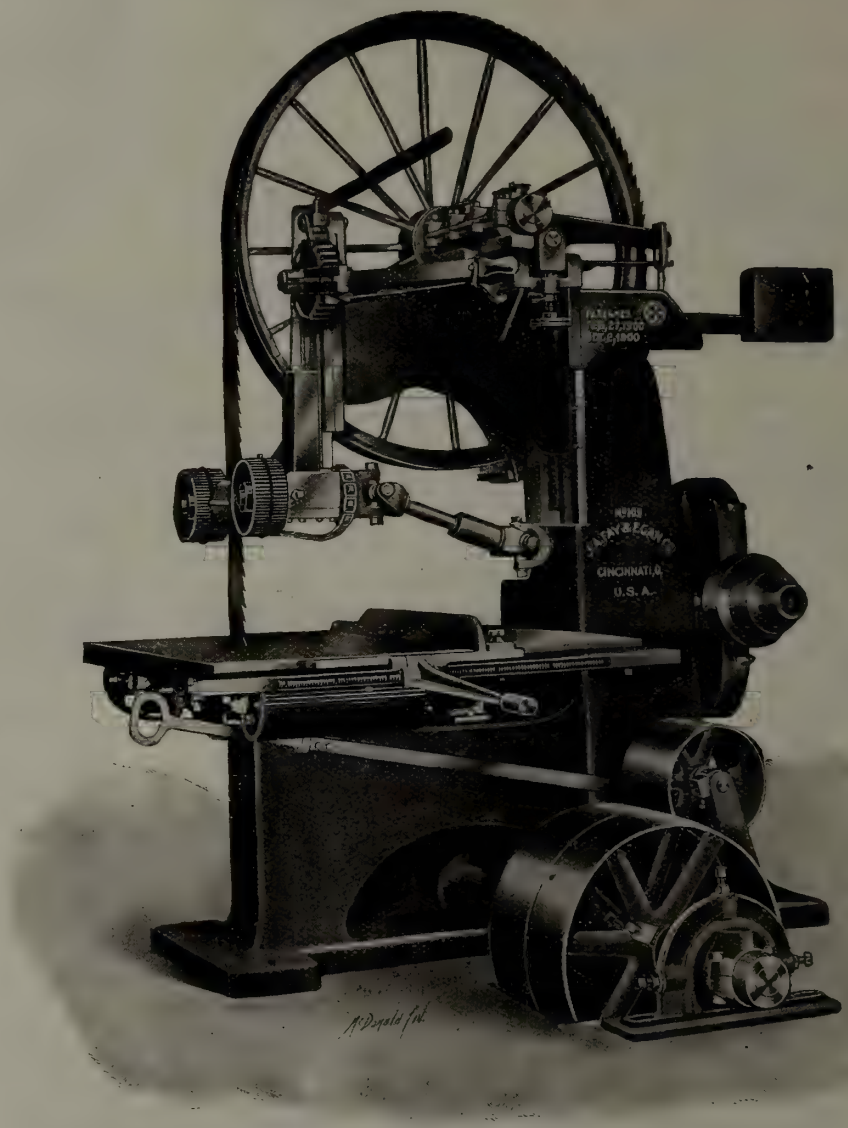
Send for Catalogue No. 6

Big Rapids, Mich., U. S. A.

If You Need a Heavy Band Rip Saw, Look into the Merits of Our No. 109.

In our large descriptive Circular—Sheet No. 1-N

particular attention is called to the massive and substantial construction of our



No. 109 Patent Aut. Band Rip Saw

It is made for **heavy** ripping in bridge, ship and car shops or wherever a heavy rip saw is required. The general construction of this machine, its

Massive Square Column
Solid Lower Wheel
Patent Sensitive Straining Devise
Strong Feed

make it a superior tool for all lines of heavy work

Two noteworthy features on this machine are our Patent sensitive Straining Device and Solid Lower Wheel, a combination which permits the use of an extremely thin blade at a terrifically high speed without any danger of breaking it.

Feed is the strongest imaginable and consists of two heavy, fluted upper rolls and three lower ones of large diameter, all power driven.

Write for Sheet No. 1-N which illustrates and describes Our No. 109 in full.

No. 109 Patent Aut. Band Rip Saw—Capacity for material 28" wide and 14" thick.

No. 111 8″ x 16″ Four Sided Moulder

There's Real Satisfaction in Using a Hespeler No. III Four Sided Moulder

If you're looking for quality in a four sided moulder you are sure to find it in this machine. It's truly a twentieth century wood tool. We have spared no expense in bringing this machine up to its present point of efficiency; and we believe it superior to anything of its type yet offered.

The Frame is substantial and strong, doing away with any tendency to twisting usually found in machines of this size. It is machined and bolted together in such a way that the bearings are kept in perfect alignment. It is provided with heavy column in the front of the machine, which is a substantial support for the table, under head, etc. The outside bearing for the support of top arbor extends to the floor line, is planed and firmly bolted to the main frame, and is locked and bolted through the machine and table from side to side.

The Feed consists of Four 5″ rolls, two top and two bottom, all driven by our superior system of gearing, the motion being continuous and strong at any position of the table. It is simple and not liable to get out of order, and is controlled by a tightener locked in a position convenient to the operator.

The Arbors are of large diameter running in large bearings provided with oil space. The top bearing being 1¾″ in diameter, bottom bearing 1⅞″ in diameter, and the side head bearings are 1½″ in diameter.

The Top Head has a lateral adjustment, and the bottom head has lateral and vertical adjustment, both controlled by a wheel placed convenient to the operator.

The Under Head has an outside bearing extending outside the driving pulley, making three bearings in all in the bottom cylinder.

Side Heads raise and lower with the table in the usual manner, and have also independent vertical adjustment. Both inside and outside spindles can be adjusted while in operation and set at an angle. The inside head is free from all trappings and easy of access. There is ample space to permit of the using of all ordinary bits on almost any kind of work.

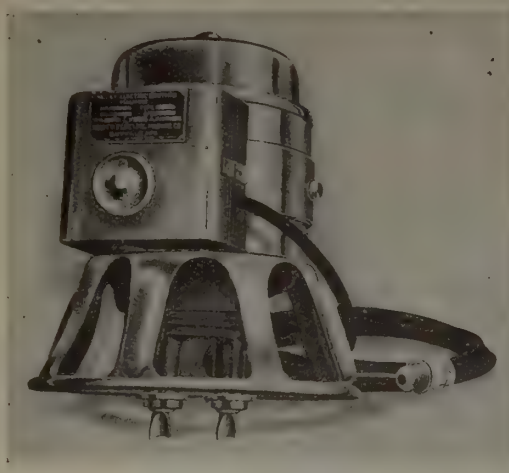
The Chip Breaker is of the weighted type and is adjustable, but for all ordinary work it will not require adjusting and moves backwards and forwards with cutter head and is always ready for work.

The Guide Springs are adjustable by simply turning the handle, both guides moving together.

The Shoe or Bonnet is adjustable to and from the head, or can be swung clear out of the way giving access to the knives,

The Main Table or bed, is well gibbed to the frame, and is raised and lowered on a large screw of the square thread type resting on ball bearings, and will drop 16″ below the cutting surface of the top cylinder.

The End Table and the bottom head are adjustable on the ways, the extreme outer section of the table having independent vertical adjustment, the whole arranged so that it is swung out of the way for access to the head without disturbing the guides



Drive Pulleys both on top and bottom cylinders, and side heads are of the anti-pneumatic type.

Tight and Loose Pulleys are 10″ in diameter x 5½″ face, and should run at 900 revolutions per minute. Horse power required 4 to 6. Floor space 5′ 4″ x 5′ 4″. Approximate shipping weight 2700 lbs.

We also manufacture a complete line of Surface Planers, Planers and matchers, Combined Planers, Matchers and Moulders, Moulders, Buzz Planers or Jointers, Mortisers, Tenon Machines, Sash and Door Clamps, Shapers, Band Resaws, Self-Feed Rip Saws, Saw Tables, Band Saws, Borers, Sanders, etc.

RESULTS ARE WHAT COUNT

A Combined Skidding and Loading Machine that will clear up the largest area at a setting and can be moved and set up in the shortest possible time will get the best results.

The latest Russel machine has some distinct features that save time and trouble, consequently money. Note the new method of suspending skidding sheaves. They are hung from a vertically hinged jib or triangle, the outer end of which is guyed by two lines one on each side, which are power-tightened and can be set while skidding lines are going out. The guy lines lead back so they do not interfere with skidding or loading. The uppermost leg of the jib has a spring connection to the tower, reducing shocks. All

skidding strains are absorbed by the guy lines. The swinging boom is operated by wire ropes passing through sheaves suspended from a steel frame projecting from tower and leading to two drums on loading engine, controlled by one lever. Machine is raised or lowered by hydraulic or patented gear jacks. Built for 2 or 4 lines, with stiff or swinging boom, constructed entirely of steel, except loading boom. Is without question the strongest and fastest machine of the day.

McDonough Horizontal Band Resaw Machine

The above cut herewith shows the McDonough Horizontal Band Resaw Machine. This is the most practical and efficient horizontal resaw manufactured. Equipped with saw wheels seven feet in diameter, weight 24,000 pounds; also built with sixty-inch wheels, weight 16,000 pounds.

We also handle smaller Resaws for factory use from 44 up to 60 inches. The Resaw is one of the best paying machines in the saw mill. It is a lumber saver. We are the sole Canadian Agents for this machine and we solicit your enquiries as to price and the work that it will do. At the same time, remember that we are builders of up-to-date Saw and Shingle Mill Machinery. We build Saw Carriages from $200.00 up as high as you like. Edgers from $125 to $1,250.00.

We also make Log Loaders, Kickers, Niggers and all the machinery for a first-class mill. Let us quote prices on anything that you want. Large or small orders will be attended to promptly.

This Saw Stands Without a Rival

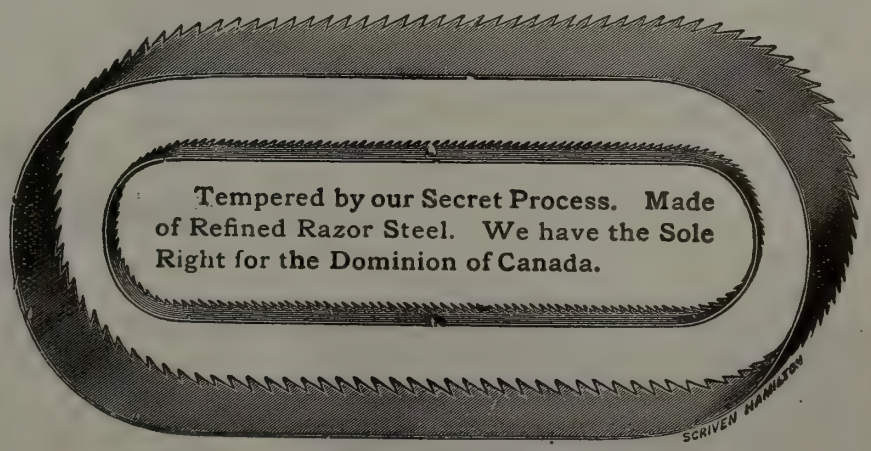
AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

MANUFACTURED BY

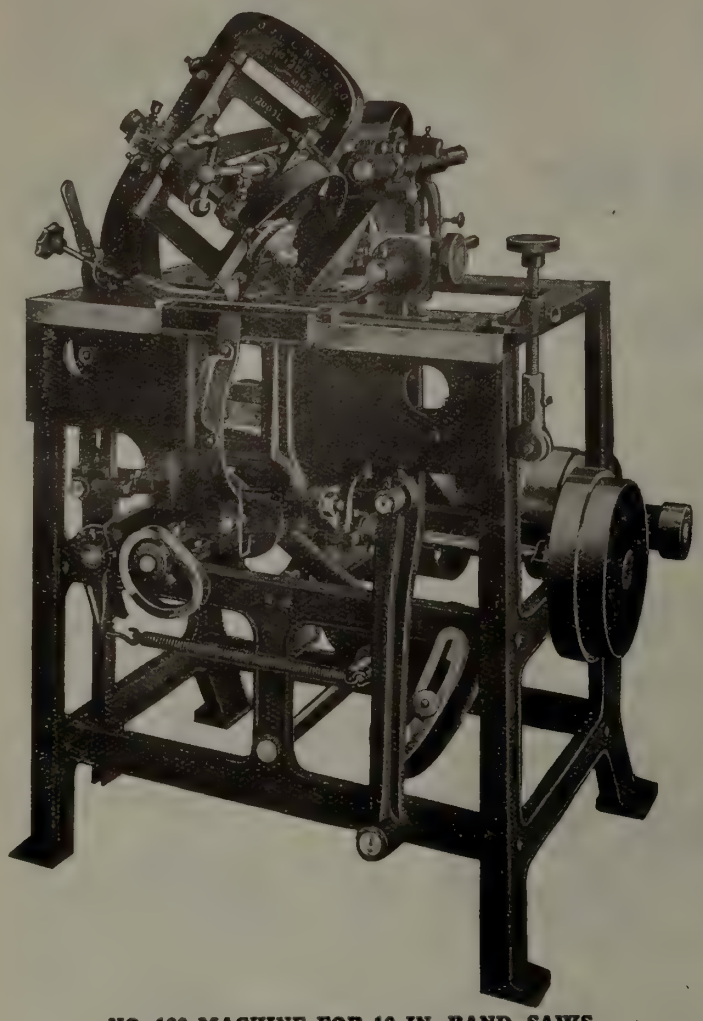


SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Razor Steel, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

NO. 120 MACHINE FOR 10 IN. BAND SAWS.

SAW MACHINERY

The Most Efficient Band Saw Sharpener Made

Equipped with **new automatic idler** bracket keeping the belt to the emery wheel at the same tension as it travels up and down. Idler pulley is located on slack side of the belt and can be adjusted in line with the emery wheel. Belt is held to same tension at all times by a large spring. There are **no flange pulleys** used on this machine, with the use of automatic idler the life of the belts is prolonged. **Head** is constructed with 60 degree angle shaped slides on both sides so that **wear can be taken up by adjusting one gib.** Every wheel arbor can be adjusted so that a straight wheel will do the same work as a concaved one. Head is adjusted to a 45 degree hook.

Saw rest is moved up and down by hand wheel at the right hand side of the machine, convenient for the operator. Adjusting screw is so placed that it **cannot become covered with emery dust.** The saw rest is made of self hardening steel and can be easily replaced. **Back feed** is of a new design and is strong, simple and effective. The adjustable eccentric cam on the cam shaft is connected to the long back feed shaft by means of a lever, this lever rocks the back feed shaft that moves the back feed arm. Back feed finger can be turned out of the way and allow saw to be lifted up without interfering, machine is equipped with an **adjustable cam.**

To those interested in the highest type of machinery of this kind we invite your inquiries and ask permission to send detail description.

Twelve Good Reasons Why—

Our 1910 Model Band Mill is the most up-to-date, most compact, easiest operated, and fastest cutting mill as yet designed

Because—

The base extends completely around the mill.
The upper wheel is supported above and below mandrel.
Top Wheel has extra wide range of adjustment.
The tensioning device is double knife-edged.
The upper wheel is mechanically tilted from front or rear.
Both guides are saw-centre swing, single or double cutting.
Upper guide is absolutely rigid, non-breakable, water cooled.
Operating mechanism is direct, rapid and power driven.
No belts to gum or slip.
All mechanism is enclosed within column.
Lower Guide is extra high and opens instantaneously.
Every part is accessible.

This Mill is completely described in Bulletin No. 102. Send a post card for it.

Pine, Spruce and Hemlock
A full line of dry lumber in stock for prompt shipment. Let us give you our prices for anything you require in lumber.

Pine Doors
We have long appreciated the fact that price is not the only requisite a dealer must seek in placing his order for doors. Poorly manufactured doors can scarcely be considered a bargain at any price.
Door Making is our Specialty
We have equipped our plant with the best door machinery made, and we are turning out doors that **are right in quality and right in price.**
Our doors need no commendation. They prove themselves. They are business builders for every dealer who handles them.
If you have not received our latest quotations on Doors, Sash, and Interior Trim, write us to put you on our mailing list. It will be mutually advantageous.

The above cut represents our No. 83 Four Sided Heavy Duty Moulder which includes everything that is necessary for strength and hard continuous work, eliminating all useless trappings

ALL GEARS are cut from the solid, which insures smooth operation and a feed free from vibration

THE FRAMES are of very heavy design planed and bolted for cross girts and where jointed to the base

THE BEARINGS on the upper and lower cylinders (three in each case) are what is known as White's patent type, familiar to all users of modern machinery

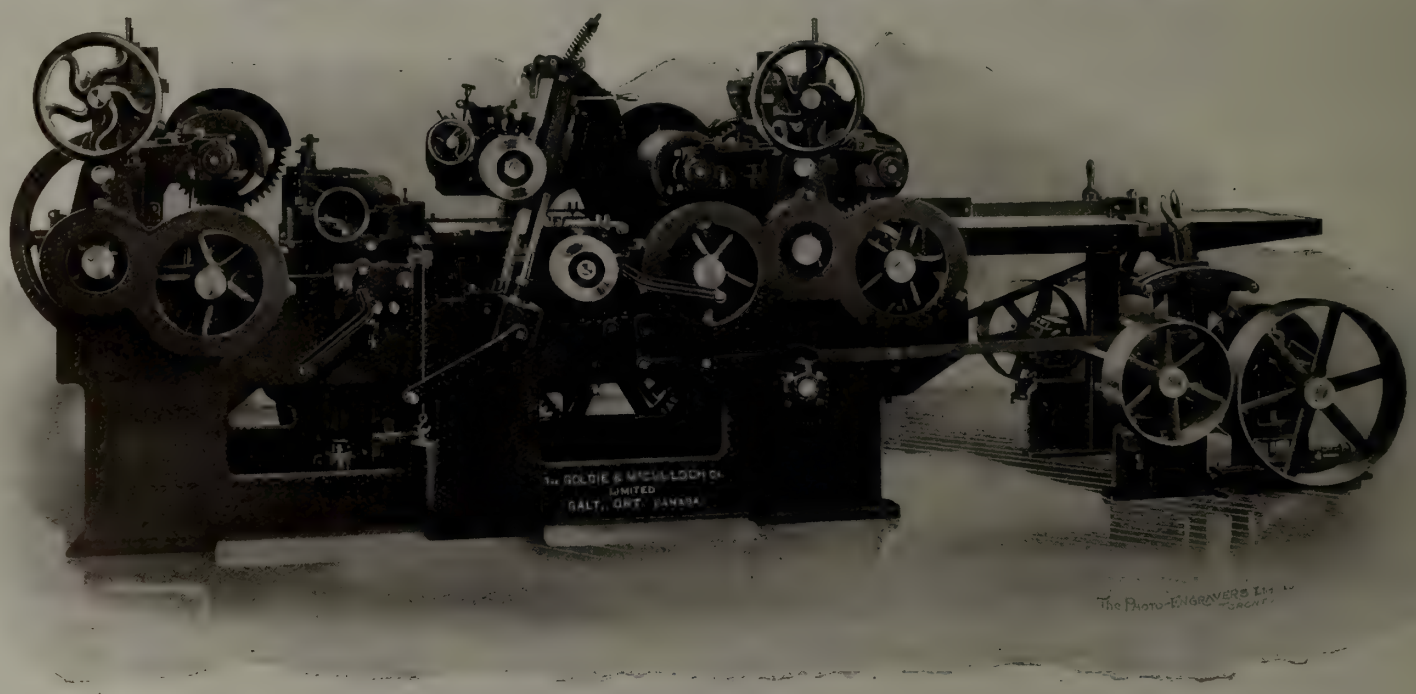
SIMONDS

Inserted Point Saws

Made in Montreal

Are you buying a new saw this winter? Then listen to what some other mill men say about the Simonds Saw. We quote from their letters. "As near perfection as one could be made for our mill." "Miles ahead of any other—would not take $100 in gold for it." "Our favorite saw in the mill." "First class, works fine." "Runs equally well winter or summer." "Your saws have proved the best I ever used." "It's the only saw I can get to stand up in frozen timber."

Some of our friends may be over enthusiastic, but there you have their own words. Isn't it enough to cause you to hesitate and learn more about the Simonds before buying any other make? Really he who uses this saw profits much more by it than do we in selling it. You have more to gain than we.



An attractive little booklet fully describing these saws can be obtained by addressing our nearest office.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For Manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 30 Toronto, May 15, 1910 No. 10

The pasing of King Edward, the peacemaker, has brought sorrow to countless millions in all parts of the world. Among the people of Canada that sorrow is keenly felt, with a personal grief as though we had each lost a dear member of our own family. But our sorrow at the passing of the great monarch is softened by his last peaceful moments and by the great example which he left for the guidance of our new King and for our own inspiration

B. C. Loggers' Request Refused

The British Columbia Government have taken the only natural course in deciding not to remove the prohibition of the export of rough cedar for manufacture into shingles. From time to time this class of request has been made of recent years and on special occasions, when there was a danger of logs going to waste in the water, the Government has acceded. Such a course was commendable enough, as the logs could not be manufactured in Canada in time to save them from the ravages of the marine borers. The present instance, however, is a very different affair. The British Columbia Loggers' Association, whose members had been foolish enough to cut more logs that the market required, desired to export them to the United States, giving as their reason the excuse that they had lost the advantage of the American shingle markets because of the recent increase in the duty upon shingles entering the United States. It would be a very doubtful advantage, however, for the loggers of British Columbia if they were permitted to sell their product across the border. The price of shingles in the United States recently declined 20 cents on account of a difference of opinion between the manufacturers and the wholesalers as to who should absorb most of the profit which the increase in the duty had enabled the industry to secure. The shingle mills of the State of Washington have all suspended operations, throwing some 9,000 men out of employment. When such conditions prevail across the line, it would be absurd to send Canadian cedar logs into that country. In fact, it is almost probable that the loggers will not be disappointed at the refusal of the Government, because this latest development in the industry across the line may result in a protracted depression in the price of shingles, rendering that market for logs even less attractive than the British Columbia market. It would be the part of folly, moreover, to make such a move when the increase in the tariff on shingles entering the United States has only been in effect about nine months. The shingle industry in the United States and Canada has been in such a state of flux during that period that there has been no opportunity for adapting it to the new conditions.

The shingle manufacturers of British Columbia, like the loggers, have frequently suffered from a disposition to produce more than their markets feel inclined to take. They should both be given a longer time to appreciate the fact that they have only their own efforts to look to for any improvement in the conditions of their markets. If the prohibition of export is to be removed whenever the loggers find that they have a surplus on hand it might just as well not be on the statute books at all. It is designed for a purpose, and that purpose is to encourage Canadian manufacturing. This should be kept in view permanently, and the Government should make it clear that only in case of an actual crisis of a nature which is unavoidable and not created by the loggers themselves, will a proposition to remove the prohibition be even considered.

The only reasonable solution of this problem is that the loggers should find some practical manner of learning how to estimate more accurately the requirements of the markets which they have to depend upon, so that they may not be so continually and regularly overstocked. Shingle manufacturers should take the lesson to heart. It would be far less injurious at this stage if they and the loggers were to stop operations altogether for some time to come, rather than that the logs should be exported to the United States mills to employ United States laborers in their manufacture. This was one of the objects had in view on the part of the people of the United States when they increased their duty, and Canadians would only be playing into their hands and giving them control of the shingle business completely if they made a practice of exporting their logs whenever they were troubled with a surplus.

Lumber Trade Marking Time

The lumber situation throughout Canada at present is rather peculiar so far as it concerns actual market conditions. One could find reason for arguing either that there is a fair prospect for a period of business activity, or that we have somewhat discounted such a period already by the activity of the last few months and have to look forward to a period of rather a listless trade. Fortunately those who take the former view are generally believed to be nearer the truth. The situation, however, is one which will bear careful study. For about a year past manufacturers, wholesalers and dealers have been continually doing their best to make one another believe that the trade depression which commenced at the close of 1907 and continued through 1908 and part of 1909 is completely a thing of the past. In short, they have been indulging in the process of raising themselves by their own boot straps. They claimed, and not without apparent good reason, that conditions were certain to improve steadily until they had reached a generally satisfactory state. Unfortunately, however, the steady improvement became a little too rapid and for a short time past the trade throughout eastern Canada in particular has been practically marking time.

This is rather a fortunate feature of the present situation and will serve in a large measure as a necessary check upon any inclination to force the lumber consumer to take more material than he really has any need for. After all, good trade conditions depend, not upon the volume of sales, but upon the rate at which the material produced goes into actual consumption. In other words, the most satisfactory state of affairs for the lumber trade is a nice balance between the quantity produced and the quantity consumed. From this point of view it is clear that the lumber trade in Canada has no great reason to complain to-day. It is equally clear, however, that those who are engaged in it are not realizing quite so satisfactory a return to normal trade conditions as they were expecting.

Probably the most fruitful source of the present dulness is the poli-

tical uncertainty prevailing in the two countries which afford the largest markets for Canadian lumber: Great Britain and the United States. Until this has been cleared away, it will be unreasonable to expect a return of the conditions which prevailed in 1907. That everything has not been plain sailing during the last few months for the lumbermen of eastern Canada is plainly shown by the regrettable assignment of the old established firm of Andre Cushing & Company, of St. John, N.B. The story of their trouble is a brief one. It does not indicate incompetence or reckless operation of any kind, but simply that the strain of many months of low prices and dull markets has at last depleted the ability of the firm to make ends meet and the banks have been obliged to step in to protect themselves. People who are in the habit of imagining that all lumbermen are making splendid profits would do well to consider this case, in which one of the largest, most conservative and most energetically managed lumber concerns of the country has come to grief. Fortunately this is an isolated example which it is to be hoped will not involve any others in disaster. It is, however, a strong proof of the fact that the lumber industry, in spite of all the glamor which pertains to it in the eyes of those who are not engaged in it, is not always a bed of roses.

In marked contrast with the quietness of the lumber trade is the activity which prevails in Canada in general. The Department of Trade and Commerce announces that the figures for the fiscal year which has just ended will show that Canada's trade during that period has been the greatest in its history. The figures for the year ending January 31st have already been published, and they show that the total trade of Canada was $655,546,884, an increase of $102,072,692 over the same period in 1909, and an increase of $10,118,640 over the record year of 1908. The imports for this period decreased by $10,464,625 as compared with 1908, and the exports increased $20,653,265. The lumber trade has enjoyed a certain amount of expansion and its figures show that for the twelve months ending with February the trade in forest products amounted to nearly two millions more than during the similar period in 1907. The exports of wood and manufactures of wood for the eleven months ending February were nearly eight millions in excess of those for the same period in the previous year. Notwithstanding the fact, therefore, that the lumber industry is somewhat lifeless compared with the activity of trade in general, there is every reason to expect that with careful and conservative business methods a period of expanding and successful trade is at hand. Everything depends, however, upon a most careful consideration of the condition of the consumer. After the disorders from which he has only recently recovered, it will take some time for his appetite to become normal, and any attempt to force it might be attended by serious results.

Lumbermen and Settlers—The Government's Plain Duty

The increase in the stumpage dues and ground rents in connection with the timber limits in Ontario, has been made apparently for the object of increasing the revenue of the Government. It does not look as though the Government saw anything but the revenue-producing features of the changes they have made. The dollar is being held so closely to their eyes that their own duty to the lumbermen is completely lost to view. Possibly this is the wrong interpretation of the situation. It may be that the Government intend to recognize that unless they give something to the lumbermen in return for the additional taxation, the public will look upon their increased taxes as something which may be politely termed confiscation. If the Government take this view of their duty they will not resent having the duty explained to them

Briefly put, the duty of the Government of Ontario is to protect the owners of timber licenses in the possession of the property purchased from them. The management of the settlers' land grant business of Ontario has long been conducted in a manner which can be defended only from a political point of view. The sin of the Government, however, is not one peculiar to any one party. It seems to be a recognized principal of Government in Ontario that the lumbermen of the country, in return for permission to cut timber (for which they pay handsomely), should be obliged to allow their licenses to be deteriorated by grants to settlers. Bona fide settlers would be bad enough, unless the license owner were relieved of the tax upon the land thus withdrawn from his license. But when he is not so relieved, and when, in addition, the settlers frequently are merely timber pirates, the lumbermen have reason to express their opinion of the Government. Th duty of the Government is to see that in return for the money received from the lumbermen they are protected from timber pirate settlers.

Those who are not acquainted with the facts would be slow to believe in them. But the Government know all about them and calmly ask the lumberman what he is going to do about it. And, to be frank, the lumberman is helpless and can only hope that some day the Government's conscience may relent. Take, for instance, a concrete case and consider how it would be dealt with if one of the parties were not a government, and therefore able to do very much as it wills. In the limits of a large manufacturer on the north shore of Georgian Bay, a certain township is about one-half settled by bona fide settlers. The land upon which they live once grew a fine crop of timber, for which the owner of the license paid the regular Government charges. Then came the settlers, and the Government gave them the right to cut the timber and sell it to the license owner This was not a great evil, as the lumberman understood that bona fide settlers could be given these privileges. But the lumberman still pays ground rent for the land occupied by the settlers. The moment settlers are permitted to enter upon land in a timber limit, that portion of the land should be excluded from the amount upon which the license owner is taxed. But the Government does not see it in this light and continues to take money for which it gives no return.

Quebec's Pulpwood Action—Its Probable Effects

The decision of the Government of Quebec to prohibit the export of pulpwood cut from Crown lands has, as was to be expected, created a great deal of interest and not a little criticism, both in Canada and in the United States. From the Canadian point of view tsere is only one criticism which can reasonably be directed against the measure, namely, that the smaller owners of pulpwood in the province will be cut off from the United States market and will suffer heavy loss until mills can be built in Quebec to use their pulpwood. It is feared by those who criticize the measure on this ground that the building of the mills will take a number of years and that in the meantime pulpwood owners will be injured, whereas the seigneurs and others who hold large quantities of private timber land will benefit by the demand from the United States and delay the erection of mills in Quebec by selling their wood across the line. It is scarcely to be feared that such results will come about. From the indications at present, the rapidly advancing price of paper in the United States will result in money being directed towards the building of paper mills in Quebec without delay. The most remarkable feature about the whole affair, in fact, has been the immediate effect of the measure upon the paper market of the United States and upon the manufacturers and consumers of paper. With one voice, newspaper publishers in the United States are urging upon their Government the necessity for going to almost any extreme in order to secure Quebec pulpwood for the mills from which they draw their supplies of paper. They argue that they are face to face with a loss of millions of dollars unless they can obtain an uninterrupted supply of pulpwood from Quebec.

The trouble in the United States has been so clouded by political issues that it has been impossible to obtain a clear view of the situation until now. The Government at Washington have been accused of bringing about what is called a "tariff tangle" with Canada. Canadians, however, cannot see the matter in this light. The difficulty so far as the United States are concerned is not a "tangle" at all, but a direct development out of natural conditions. The determination to prohibit the export of pulpwood may have been hastened by the action of the United States Government in placing a heavy duty upon print paper

and wood pulp, but if so, this was only a minor influence. The prohibition had to come in the end, irrespective of any duty imposed by the United States, and so far as present appearances indicate the prohibition will have to remain in force indefinitely, irrespective of any removal of duty by the United States, either from paper or wood pulp. Premier Gouin has as good as promised that this prohibition has now become an integral part of the Government's policy.

In considering the situation from a purely economical point of view, it is plainly clear that the Government have taken the only course that was open to them. The loss to the United States newspapers will be regrettable enough, if it really becomes extensive, but the loss which the people of Quebec are concerned in most closely is one which they have already submitted to for many years, i.e., the loss of their own natural resources, and the permanent injury resulting from the placing of those resources under the control of a foreign people. Too much stress has been placed upon the importance of Quebec's action from an international point of view. The Dominion Government is in no way responsible for the action taken by Quebec. At the same time Quebec's course was not directed against the interests of any other country. The decision was merely the result of a national desire to make the most of the country's own property. With the example of Ontario to go by, it is a foregone conclusion that the people of Quebec will be greatly benefited by this step and that this benefit will not be slow in making itself felt, even by those who have most fear, the smaller owners of timber.

It is encouraging to note that, according to recent despatches from Washington, a more reasonable view of the situation is being taken than that which we were at first given to believe was general. The plain logic of the situation is too strong to overcome. The people of the United States will, of course, seek to make the most they can of Quebec's course whenever the reciprocal tariff arrangements are being discussed, but they already appreciate Canada's situation thoroughly and will have no reason for offence if Canada follows the very course which has been the most important factor in making the United States, themselves, so prosperous.

Editorial Short Lengths for Busy Readers

There seems to be just as strong an objection on the other side of the line as in Canada to the recent ruling that lumber imports must be accompanied by a tally showing the actual lading of each car. The importers modestly point out that, taking them all round, they are as much entitled to be trusted as any other class. If the Government believes it is not getting as much duty as it is entitled to, they point out that a more sensible remedy would be to employ a few secret service officials to look into the matter. At a much smaller cost and without imposing any unfair tax on those who are conducting their affairs honestly, a more effective remedy could thus be secured. Canadian exporters have also made representations upon the subject to United States Consul-General Foster at Ottawa, who has taken the matter up with the Government at Ottawa.

The people of the United States, in their anxiety about the pulpwood situation, have been quick to scent danger from afar. The United States consul at St. John reported that that province was about to make it law that no pulpwood cut from Crown lands should be exported. This was an error of judgment. Hon. W. C. H. Grimmer, Surveyor-General of New Brunswick, states that there is no foundation for the report. "The Legislature of New Brunswick passed a resolution stating that the prohibition of the export of pulpwood from the Crown lands of the province would be desirable," he said, "and a committee, of which I was a member ex-officio, was appointed to look into the expediency of enacting legislation to this effect. We haven't collected a great deal of information, but, judging from the little we have already collected, you may say most emphatically that there's nothing, absolutely nothing, in that Washington despatch."

A question of considerable interest to Canadian exporters of spruce plank has recently come before the Treasury Department at Washington. A contention has been made on the part of the Treasury that 1¾-inch spruce plank should be dutiable at the full 2-inch measure by reason of the fact that, while purchased at the mills as 1¾-inch, it is the custom of the trade to sell it in United States markets as 2 inches thick. A large number of lumbermen were present at a recent hearing on the subject and a strong case was presented in opposition to the Government's proposal. One would expect the Treasury Department to go about the matter in a different manner if they really thought they were not obtaining as much duty as they were entitled to. If they are allowed to charge duty on 1¾-inch as though it were 2-inch, the precedent would permit them to do the same thing to 1½-inch, and would be a serious matter for lumbermen. It cannot be contended that 1¾-inch is just as valuable as 2-inch, or there would never be any 2-inch manufactured.

It is instructive to note that scarcely any objection to the proposed reciprocal trade negotiations between Canada and the United States comes from the States or Provinces which are close to the boundary line. In the United States, what little objection is found to the proposal emanates from the southern States, which are less concerned in the question and naturally not so well informed. The "Southern Lumberman" seems to make the question an almost personal one, which, considering the free entry of yellow pine into Canada, is rather ungenerous. It considers that Canada has been unkind to the people of the United States by permitting the Province of Quebec to prohibit the export of pulpwood from Crown lands, and advises that the reciprocal trade negotiations be called off. The wonder is that Quebec has been indifferent to her own interests for so long a period and has permitted the people of the United States to come and pick her plums free of charge.

The matter of ethics is closely connected with and scarcely second to the subject of inspection. I allude to that phase of business ethics which has to do with the wilful substitution of one grade for another by a dealer or manufacturer who takes an order for a high grade and knowingly fills it with a lower grade, or conversely "sweetens" or "juggles" grades so as to make a sale or win a customer from someone else, or "kicks" without just cause to avoid a merited loss or get unearned profit.

This class of trouble is more deeply seated, more vicious and more difficult to deal with than even inspection irregularities. It partakes of moral depravity and no suggestion will thoroughly reach the trouble except one that will reform the individual.

Here association work is peculiarly appropriate, as personal work along lines of reformation is nearly always resented. Much can be accomplished, however, by personal work along parallel lines and particularly by convincing delinquents that they can not possibly derive lasting benefit from such practices.—W B. Stillwell, in an address to the N.L.M.A.

"There are many details between the manufacturers of lumber and shingles and the retailers, which ought to be attended to," says a reader of the "Canada Lumberman" in a letter. "Take, for instance, the classification of shingles. How often the outside rows are merchantable, and marked 2X, 3X, or 4X, while the inside bunches remind one of the apples in the centre of the barrel. This applies to shingles from all parts of the country, including British Columbia and New Brunswick. The present system of marking is no insurance against dishonest packing. The retailer has the loss to bear when he deals out the shingles to his customer. A 3X B. C. shingle should be above reproach, but in many cases it is not. There should be a law to prevent this deception, and the manufacturers should be obliged to guarantee their shingles." There is much to be said in favor of insisting upon honest methods in shingle packing Many of the large manufacturers do live up to their duty in this respect, but the writer of the above complaint is probably not an isolated victim of unfair packing. Some of the difficulty in marketing shingles at a fair price would be overcome if uniformly honest shipments were made. Men who place thin or faulty shingles in the centre of a bundle, are stealing money when they sell the shingles as a uniform grade. Apparently much of the trouble among the shingle men in British Columbia is that some of them do not hesitate to take this kind of an advantage of their customers or to play a similar trick on their fellow-manufacturers.

Lumber News from Maritime Provinces

Regretable Failure of the Old Established Firm of Andre Cushing and Company—Nova Scotia Makes Important Changes in Crown Lands Act

The old established firm of Andre Cushing & Company, of St. John, N.B., have made an assignment to the Eastern Trust Company. The crisis is stated to have been precipitated by the Union Bank of Halifax, which is believed to be the largest creditor. It is said that the bank is fairly well secured and will not suffer a very heavy loss. It is authentically stated that there are no other secured creditors. The total amount of the indebtedness has not yet been made public.

The firm of Andre Cushing & Company are probably the largest operators in the maritime provinces. They were established 58 years years ago and have always been looked upon as one of the most solid firms in New Brunswick. Mr. George Cushing, who is the sole member of the company, has for a long time been one of the most important factors in the industrial life of St. John and in the province as a whole. He is a man of known integrity, progressiveness and great business energy and his courtesy and generosity have endeared him both to the public and to his employees. It is hoped by all who have known him that he will come out of his present difficulties and re-engage in the lumber business. For the present, the manufacturing will be proceeded with as usual. The company operate three mills in the vicinity of St. John and employ a very large number of men. For some years they have been struggling against heavy indebtedness, hoping by vigorous attention to business to liquidate their liabilities. They were accomplishing this end with a fair measure of success until the financial crisis of 1907, which entailed heavy losses owing to the decline in the price of lumber. Their market is chiefly in the United States, and for that reason they suffered severely as the financial crisis was felt more extensively in the United States than in the English market. The company had to reduce their cut and curtail their business, and as a result their profits dwindled until they were unable to pay interest on their fixed charges and leave a sufficient margin of profit to enable them to pay off the indebtedness.

Recent Lumber Exports from St. John

April 30—Roger Drury, Philadelphia ...	1,884,200 spruce lath.

Important Changes in N. S. Crown Lands Act

The Nova Scotia Government has brought in legislation making several important changes in the Crown Lands Act. They lead to the appointment of a provincial land surveyor and the reorganization of the survey system, while another provision enables the Government to establish forest reserves. Crown lands will not be granted hereafter except to bona fide settlers, it having been found in the past that a good deal of such land had been taken up under such a plea when, in fact, the only object was to obtain possession of the timber growing on it. One clause of the old Act is re-enacted, to the effect that lands upon which the trees are of scrubby growth and upon which hardwood is the principal growth, may be leased, under terms and conditions to be prescribed, provided the person proposing to lease the same undertakes to expend money in the erection of mills and machinery for the manufacture of pulp or other wood products. Section 84 of the new bill reads: "The governor in council may at such time as is deemed expedient prohibit the export to foreign countries of pulpwood or timber or wood cut or removed from lands belonging to or held under lease or license from the Crown, to be used in the manufacture of pulp or pulp products." In giving notice of the above legislation, Attorney-General Maclean explained that the power will not be exercised except for good reason, but, he added, he thought there were many good reasons why the Government should take the power.

The new plant of the Canada Woodenware Company at South Bay, N.B., will have a very advantageous situation. The logs will be brought in by river on one side of the plant, and the railway for shipping the finished product runs along the other side. Special attention will be given to the construction so that the insurance will be moderate, and the general layout is so planned to give the most efficient and economic handling of the raw material. The machinery is of the latest and most modern type. About 60 men will be employed at first, but the number is expected to be increased rapidly. The company plan to do about $90,000 of business, or one-tenth of the present volume of this business in Canada.

Hon. W. C. H. Grimmer, Surveyor-General of New Brunswick, has announced that a committee of the executive council, composed of the Provincial Secretary, the Chief Commissioner of Public Works, and himself, would commence the work of gathering evidence on the pulpwood question at an early date. It is expected that the committee will make a report to the Lieutenant-Governor in Council no later than next fall, and the question of whether New Brunswick will or will not prohibit the exportation of pulpwood cut on the Crown lands of the province will then be decided.

An Important Labrador Enterprise

Plans of Anglo-American Development Company Which Will Cut Timber in the Far North East

Details of the Anglo-American Development Company's recent deal in Labrador timber lands have been made public by Chas. D. Stanford and R. H. Wing, of Bangor, Me., who are members of the syndicate which has acquired the rights obtained by the Anglo-American Company from the Newfoundland Government. The tract comprises 13,853 square miles, or 8,865,000 acres, densely covered with spruce, the present stand being estimated conservatively at thirty billion feet, equal to 50,000,000 cords of pulpwood. For the right to cut over this territory for the period of 50 years, with the privilege of 49 years' renewal, the Anglo-American Company, organized last August at St. John's, Nfld., contracted to pay to the Newfoundland Government a rental amounting to $4 per square mile for the first year and $2 per square mile for each subsequent year, and the syndicate which has taken over the lease has just paid the first year's rental, amounting to $55,412. The syndicate, composed of 24 New York capitalists and Messrs. Stanford & Wing, of Bangor, will develop the tract as soon as surveys can be made and water powers improved, the purpose being to manufacture the timber into pulp, as the export of pulpwood is prohibited. The tract acquired is about equal in extent to the State of Massachusetts, or to the entire area of Maine's timber land on Labrador, extending from Byron bay, on the north side haustible.

The property was secured from Mr. R. W. Strong, of St. John's, Nfld., who had two other men associated with him in its ownership. They will receive from the purchasers $250,000 and 49 per cent. of the proceeds of the industry in future. The sale includes 13,580 square miles of eimber land on Labrador, extending from Byron bay, on the north side of Hamilton Inlet, to Port Manners.

The new company will be capitalized at $25,000,000. Development work will be commenced about the end of the present month. The intention is to erect there pulp mills at the most convenient points on the coast where the timber limits are situated. They will manufacture pulp and export to England and America. It is contemplated that exporting can be carried on at least six months of the year, and the manufacturing all the year round. Mr. R. W. Strong will leave St. John's about the 20th of May if conditions permit, taking a party of about 40 men, including four surveyors, axemen and chainmen. The survey party will work there all summer. This undertaking when properly started will mean permanent employment for thousands of men.

The log production for the initial quarter of the year in British Columbia is said to be 250 per cent. higher than in the first quarter of last year.

Lumber News from Sunset Province

Coast Loggers Forming an Association—Emerson Lumber Company's Plans—Offshore Trade of Vancouver

An association of British Columbia coast logging interests, to be known as the British Columbia Log Brokerage Company, is now in process of formation in Vancouver. In a few days the company will complete incorporation and the work of active organization will be immediately proceeded with. In some respects the work of the organization will be along the lines followed by the Puget Sound Log Brokerage Company, the membership of which includes all the logging interests of the Puget Sound country, large and small. It is reported that practically all the loggers on the coast are associating themselves with the British Columbia Log Brokerage Company. One of the principal objects of the company is the securing of information respecting logging and lumbering market conditions not only in British Columbia but elsewhere, wherever such may have a bearing upon the local logging industry. The general aim of the association will be to place the logging industry of the coast of British Columbia on a more stable basis than it has occupied for a number of years. A plan of the organization is that it shall act as selling agent for the log output of its members. It is also the object of the company to provide that in future there shall always be a plentiful supply of logs for the trade. The formation of the association is looked on by business men and lumber manufacturers as being a step in the right direction—as one of the most important moves made by logging interests in a long time. The membership of the company will include both large and small loggers, the big companies operating with railways and dozens of logging engines, and the individual working on a comparatively small scale. The members will rank on an equal basis no matter how large or small their operating interests may be.

Washington Mills all Closed Down

The shingle situation on the Pacific coast of the United States has reached something of a crisis. Practically every mill in the State of Washington has suspended operations indefinitely as a result of a cut of 20 cents in the price, announced by wholesalers. Virtually the only mills running are the combination plants which turn out lumber as well as shingles, and the owners of these mills have agreed to store all shingles manufactured, with the exception of those called for in mixed orders. Full cars of shingles will not be shipped until the market recovers. At a conservative estimate, more than 9,000 men have been thrown out of employment temporarily as a result of the shutdown. The wages of these men amounted to at least $30,000 daily, and the shutdown is causing a loss of about $10,000 a day to the mill owners. The loss to the associated industries is also considerable.

It is said that the action of the mills is prompted by a proposal on the part of jobbers to take advantage of the low prices and lay in large stocks as to cause a shortage and then sell to the retailers at a high figure. The loss thus occasioned would fall on the manufacturer and consumer. Eastern retailers have declared themselves in favor of the movement and may refuse to handle Washington shingles until the market becomes steady. If the manufacturers are unsuccessful in the shutdown movement there is still another avenue open to them. A movement is on foot among them to organize an association which will supplant the jobbers, by establishing selling agencies to deal with the retailers. This would eliminate the middlemen and steady the market.

The growth of the Vancouver, B.C., lumber trade to offshore points is shown in a statement issued by the British Columbia Mills, Timber & Trading Company, operators of Hastings mill, from where all Vancouver's offshore lumber is shipped. During 1909 the lumber shipped from these mills was 34,677,385 feet, valued at $472,200. This analyzes as follows: United Kingdom and Europe, 4,947,503 feet, value $79,428; Australia, 9,368,405 feet, value $119,159; New Zealand, 636,065 feet, value $10,095; Pacific Islands, 2,738,141 feet, value $49,815; Africa, 4,268,758 feet, value $56,762; Japan, 1,355,140 feet, value, $20,145; China, 4,268,710 feet, value $46,401; Chile, 7,094,693 feet, value $90,-395. The largest customer for lumber was Australia, which took nearly twice as much as the United Kingdom and Europe. Africa and China imported practically the same amount, the former taking only 48 feet more than the Celestial Empire, and next to Australia the biggest importer was Chile.

Sale of the Emerson Properties

The properties of the Emerson Lumber Company and Messrs. Perry D. Roe and Robert Abernethy, of Port Moody, B.C., have been recently acquired by the National Finance Company, of Vancouver, for a consideration of $600,000. The realty comprises over half a mile of waterfrontage, and, including tide flats, about 80 acres of land. The Emerson Lumber Company announce their intention of retaining the use of the mill site property for the next three years, a clause in the agreement of sale to that effect having been inserted, during which period ample time will be afforded to secure another location and build a new mill which, Mr. J. S. Emerson says, will be much larger than the one being operated at present.

The lumber industry is in full swing at Queen Charlotte City, B.C., where the Moresby Island Lumber Company is making foreign shipments of clear spruce and hemlock and is scarcely able to supply the local demand. J. E. Corlett, general superintendent, is in Queen Charlotte making his regular tour of inspection, and renewed energy will be devoted to the logging camps. If the present two camps will not supply the demand, a third crew will be put in the woods. The new wharf is out over 500 feet, and will be rushed to completion within the next ten days in order to accommodate the deep sea vessels now chartered for taking cargoes from this point to Australia.

The Victoria branch of the Vancouver Island Development League has received memoranda of two more resolutions passed by the Alberni branch of the League, advocating the reservation of a game and timber reserve around Cameron lake. These are in accord with the resolutions and sentiments of the members of the local branch of the League, members of which stated recently that despite the fact that it might, as pointed out by the Government, cost two millions or more to make the reservation, it would be worth the expenditure to coming generations to have this reservation as a magnificent monument to the resources of the island.

John Arbuthnot, J. M. Savage, J. C. McGovin and H. G. S. Heisterman, of Victoria, have sold out their interests in the Red Fir Lumber Company, Limited, at Nanaimo, B.C., to a New York syndicate. Geo. W. Hartzell, of Dayton, Ohio, is in Nanaimo looking after the interests of the company, and will eventually take over the management. T. A. Smith for the present will have charge of the details of operation as heretofore.

Cooperage Outlook is Improving

T. W. Mitchell, Forest, Ont., manufacturer of hoops, staves, headings and lumber, reports as follows: "There is, as far as I can learn, a large stock left over from last year, especially staves and headings, which makes it very dull at present. I think that the market will be all right in the near future, as the stocks of logs taken out last winter are very small and I understand quite a lot of cooperage manufacturers are cutting some lumber, which will make the present cut very small. With a fair apple crop and the good outlook for a crop of wheat, the slack cooperage market will be good next fall."

The Trenton Cooperage Mills, Limited, Trenton, Ont., report under date of May 9th as follows: The market for Canadian cooperage in Ontario is necessarily largely governed by the prospects of the apple crop. There is always a demand for No. 1 stock, for the cereal and sugar trade. Mill run and No. 2, however, are used principally for apple barrels, and a shortage in the crop soon makes itself felt. The promise this year all over is for a very general crop. Many things may happen, however, as the season advances, that will destroy the crop. In many districts, the crop was light last year. In the apple belts in southwestern Ontario and east of Toronto the crop was also light. If the promised crop this year materializes, there will be by no means too much cooperage in stock, and we may expect a decided advance in prices.

The past winter in many districts was not a good one for lumbering elm, the winter being open until quite late, and no hard frost occurring until after a heavy snowfall, making it impossible to get into the swamps. Last year the lower grades of cooperage sold cheap towards the end, and for that reason many coopers are holding back in ordering. When the business comes, it will come in a rush, making an advance in prices.

The Sutherland-Innes Company, Chatham, Ont., report as follows:

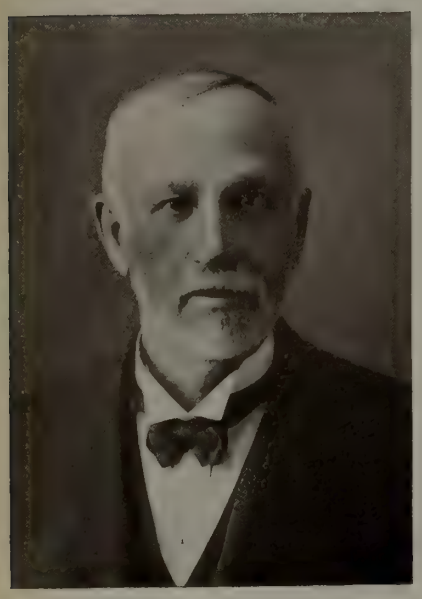
Business has opened up this spring very briskly, and there seems to be a general revival of trade throughout the world.

Dry stock of all kinds, excepting some low grade, is pretty well cleaned out from the mills, and new stock that can be got ready for the market is moving as fast as it is fit to ship.

The high price being obtained for elm lumber has curtailed the manufacture of elm staves and hoops greatly, and the weather in the south has been unfavorable to get stock on the market.

There are rumors of damage to the fruit crop in Michigan and Illinois; these rumors as yet are not authenticated, but New York State and Ontario have certainly not been affected, as never did apple and pear trees promise better.

Prices remain stationary on staves. Hoops and heading are very much firmer with better prices obtaining. Keg hoops still continue scarce and are worth $2 to $3 per 1,000 more than a year ago.



There has been quite a demand for potato and truck barrel stock, which has cleaned out a lot of low-grade material.

White and red oak staves of all kinds are in good demand. Some lines are much higher than a year ago; in fact, all lines will average from 5 to 20 per cent. better.

Cooperage men generally, are looking forward to a banner year, provided there is no setback to the crops from the cold weather during the last few days.

A Pioneer Ontario Lumberman

Brought up from Boyhood in the Lumber Business - Mr. Jacob Kaufman of Berlin, Ont.

Jacob Kaufman, Berlin, Ont.

Mr. Jacob Kaufman, of Berlin, Ont., whose portrait we reproduce herewith, is one of the best known lumbermen of Waterloo county, Ontario. Mr. Kaufman was born in the county of Perth in 1848, and spent his early days on the farm. On leaving school he started work in a carpenter shop, working there in summer and spending every winter in the lumber camps, so that from his earliest days he has been connected with the lumber industry.

In 1877 he moved to Berlin and started the present planing mill. Success seems to have attended his efforts from the very first, as progress has been made each year, and from a small mill his plant has grown to be the largest in the county. In order to cope yith his rapidly increasing business, Mr. Kaufman has found it necessary to build an addition to the present building. This addition will be of reinforced concrete, 100 x 40 feet, four storeys high, and will be equipped with the most up-to-date machinery.

Not only in the lumber business has Mr. Kaufman been successful. In 1900 he became interested in the Berlin Rubber Company, and in 1903 was the founder of the Merchants' Rubber Company of that town. After operating for several years, they were finally sold out to a syndicate, and in 1908 was started the Kaufman Rubber Company, one of the largest of its kind in Canada. Of this company Mr. Kaufman is now president.

At different times Mr. Kaufman has been honored by his fellow citizens with a seat on the town council, and for several years was a member of the Board of Light Commissioners. Mr. Kaufman is a self-made man in every respect. He started life as a poor boy and with no material assistance has gradually risen in the financial world, until to-day he ranks as one of Berlin's most wealthy and respected citizens.

Lumber Matters in the Law Court

Judgment given in Deadman's Island Case —An Agent's Position when buying Timber

Purchase of Timber by an Agent—In the case of Marsh v. Lloyd, which recently came before the Court of Appeal of Ontario, judgment has been given in favor of the plaintiff. The case involved the purchase of timber on two farms in King township for $4,500. The defendant acted as agent for the plaintiff before the sale, but claimed that on the date of the sale the plaintiff backed out and that he (the defendant) made the purchase on his own account, borrowing the money therefor from the bank. In the trial court, the defendant's case was upheld, but in the Divisional Court this judgment was reversed. The Court of Appeal has now upheld the Divisional Court judgment.

An Engineer's Qualifications—J. H. McRae, of the Rat Portage Lumber Company, at Vancouver, B.C., had recently to answer a charge of infringing the Steam Boilers Inspection Act. The charge was that he failed to notify the boiler inspector when running the mill without a duly qualified engineer. Mr. McRae testified that he had endeavored to secure an engineer, but had not be able to, and argued that the Act allowed him 30 days to report to the inspector. The prosecution testified that the wages offered, $75 per month for a third-class engineer to take charge every night for 13 hours, was inadequate. After hearing the evidence the magistrate decided that Mr. McRae was allowed 30 days by the Act to make his report. He therefore dismissed the charge.

Lumber Accounts in Dispute—Chief Justice Falconbridge has reserved judgment in the suit of Allan McPherson, a lumber dealer and manufacturer, of Longford Mills, Ont., against A. McGuire & Company, Annie McGuire and Andrew Devine, of North Bay, to recover something over $4,312 in a dispute over accounts. The defendants set up a counterclaim of $6,450 for wages, commission on the sale of timber limits and rental for mill.

Workman Seeking Compensation—For injuries received by being struck by a piece of timber while working on the Massey river, Joseph Bloom, of Ottawa, is suing the Massey Lumber Company, Massey, Ont., for $1,500 damages. Bloom was working on a "keep over" or log house when the accident occurred. He had three ribs broken on the right side of the breastbone. Damages are sought under the Workmen's Compensation Act.

The Deadman's Island Lease—Judgment has been given by Judge Morrison in a trial court of British Columbia in the well known Deadman's Island case. The Vancouver Lumber Company's lease on Deadman's Island is held to have been a breach of the trust imposed upon the Dominion Government when the property was transferred to it by the Imperial Government. The court holds that the Vancouver Lumber Company knew of the subsisting equities to which the property was subject. The Crown must be held to have been deceived, misled or mistaken and the lease to the company is declared void.

Liability for Workmen's Injuries—The Nova Scotia Legislature has passed an Act making employers of ten or more men, liable for the partial or total disability or death of their employees by accident.

Payment for Lumber Delivered—In the case of M. Giberson v. the Toronto Construction Company, which was heard recently by Judge Barry at Andover, N.B., judgment was given for the plaintiff in the amount of $1,098.75. Mr. Giberson was suing for $2,000, which he claimed was due him for lumber delivered by the defendants on the National Transcontinental Railway. The defendants claimed that in their dealings with the plaintiff that they were represented by a sub-contractor named Ferguson, who should be responsible for any payments due to the plaintiff. It is expected that the case will be appealed.

Ownership of Timber Berth—A timber berth six miles square, valued at $50,000, on the north shore of Lake Huron, is the basis of an action which has been commenced before Hon. Justice Teetzel in the Non-Jury Court of Toronto. The plaintiff is Patrick McDermitt, of South River, and the defendant Rheinard Cook, of Berlin, formerly a partner of the plaintiff's. Prior to September, 1907, the right to cut the timber was held by Ira S. K. Weber and Rheinard Cook, of Berlin, but on that date Cook assigned his half interest to Weber as security for an advance of $30,000. In February, 1909, Patrick McDermitt, of Parry Sound, a former partner of Cook, secured a judgment against him for $12,673. As it is still unsatisfied, he brought a second action asking for an accounting between Weber and Cook on the timber limit transaction, or a declaration of his own right to redeem Weber and sell the property to satisfy the judgment. The case was enlarged in order to obtain further evidence.

Statistics of Interest to Lumbermen

Imports of timber into Barbados during 1909 from Canada were valued at £3,719. From the United States timber valued at £3,414 was imported.

The export of Canadian timber to China in 1908 amounted, according to official Chinese figures, to 1,710,873 square feet. In 1907 the total was 3,392,162 square feet. No figures are given for 1906, but in 1905 the total was only 51,747 square feet. Canada should get credit for a large amount of the timber coming from Hong Kong, as this is only a distributing centre. But, unfortunately for statistical purposes, all goods landed or transmitted there, are classed in the customs returns as from Hong Kong, and the identity of the country of origin is lost.

The production of logs on the British Columbia coast during March was slightly less than in February, but higher than in January. For the first three months of the present year the number of feet scaled exceeded the number scaled during the same period of last year by about 45,000,000 feet. The figures by months are as follows: 1909, January, 16,179,114 feet; February, 19,793,851 feet; March, 35,073,973 feet. 1910, January, 37,349,092 feet; February, 39,938,638 feet; March, 38,334,973 feet. The total for first three months of 1909 was 71,046,658 feet. For the same period of 1910 it was 115,622,703 feet.

During the last nine months of the calendar year of 1909 Canada sold the United States $5,000,000 worth of pulpwood as compared with a shade over $3,500,000 worth for the corresponding months of 1908. There was no other customer for Canadian pulpwood. In wood pulp the United States bought in the last nine months of the year just closed $3,000,000 worth, or just four times as much as Great Britain bought. The total sales of wood pulp in the last nine months of 1909 were $3,800,000, as comparel with $3,200,000 in the corresponding period of the year before. The United States and Great Britain each bought $750,000 in the last three quarters of 1909. Canada's importations of paper in the last nine months of 1909 amounted to nearly $3,500,000. The United States sold her $2,225,000, and Great Britain $750,000. The total buying exceeded the nine months of the year before by $750,000.

The death is reported of Captain Thos. Thompson at Port Bruce, Ont. Mr. Thompson was at one time a sailor on the Great Lakes and afterwards a successful merchant, shipbuilder and mill owner at Port Bruce. He was ninety years of age.

Montreal Exports in Full Swing

Season Now Under Way Expected to be Satisfactory to Shippers—Improvements to the Harbor Facilities

Montreal Office of the "Canada Lumberman."
May 11th, 1910.

The export lumber season is now practically in full swing. In the short space of a week, operations have been resumed and every movement is being carried forward as smoothly as though there had been no interruptions occasioned by the winter season.

The harbor front once again presents an animated scene, with the familiar barges tied fast to the big ocean liners, and the longshoremen busily engaged in transferring their cargoes for shipment to the old land. Water, too, has been turned into the Lachine canal, and water shipments to American points will soon be commenced in earnest.

The export men are naturally looking forward hopefully to having a good shipping season. The English market is expected to prove a large purchaser of our lumber, although at the present time English orders show a tendency towards conservatism. Perhaps the recent elections and the death of His Majesty King Edward VII. will not be without their depressing effect upon the English market.

Since the close of navigation last year the harbor commissioners have not been idle and numerous improvements have been made along the docks that are greatly appreciated by the lumbermen. A noticeable feature has been the installation of elevator lifts to raise wagons and teams of horses to the second floor of the harbor sheds. This is filling a long-felt want and proving of vast service in the expeditious handling of the different freights.

The local lumber trade is still rather quiet, but shows evidences of improvement. Hardwoods are, if anything, in slightly better demand. Furniture manufacturers are asking particularly for 1¼-inch and 1½-inch birch and maple. These sizes are not, however, in frequent demand and are said to be quite scarce.

Lath are still quoted firmly, while locally the demand for cull lath is excellent at the present time.

Spruce lumber is reported to be selling well and 2x10-inch merchantable stock is especially sought after and is quite scarce.

The building figures for the month of April are just to hand and compared with the same period during the previous year show the splendid gain of $710,191. They are as follows: 1909, new buillings, $1,016,856; alterations, $95,035; 1910, new buildings, $1,647,295; alterations, $174,787. Totals, 1909, $1,111,891; 1910, $1,822,082.

Montrealers Organizing a B. C. Company

The Pacific Pulp & Power Company is just being organized in Montreal. The new company have extensive limits in the neighborhood of Prince Rupert, B.C., owning twelve sections on the Skeena and ten sections on the Naas rivers, two streams to the north of Prince Rupert which approach quite close to that town. Reliable cruisers who have thoroughly investigated this district have made an excellent report regarding the extent of the lumber available. It is principally pulpwood and fine clear cottonwood, chiefly located on numerous small islands in the rivers, and quite easy of access. Mr. A. S. Goodeves, a British Columbia timber commissioner, who has investigated this land, estimates that 45,000 feet to the acre can be cut. Based on a more conservative estimate of 40,000 feet to the acre, the Pacific Pulp & Paper Company have 600,000,000 feet of timber on their property. Mr. James Robinson, ex-M.P., of Miramichi, N.B., is at present the largest shareholder in the new syndicate, but it is stated that Montreal capital is being largely interested.

As well as carrying on a general lumber business, the company intend to generate a large amount of horse power (the first development to be about 15,000 horse power) at Union creek, 16 miles from Port Simpson and 30 miles from Prince Rupert. The head of this development is obtained from four lakes, the Union, the Deep, the Second, and the Fourth. The power developed will not only be utilized in operating their sawmills, but they intend also to supply electric light to Prince Rupert and Port Simpson, as well as operating an electrical road between these two places. In fact, their operations will extend for a radius of 75 miles around Prince Rupert. Mr. A. Scott Ives, of Montreal, is organizing the company, whose total holding comprises approximately 15,000 acres of timber land.

Champoux Interests Sold to Brompton Company

The Brompton Pulp & Paper Company have just completed arrangements for taking over the Champoux Lumber Company's interests along the St. Francis river, consisting of sawmills and 20,000 acres of timber lands. Mr. J. A. Bothwell, the general manager, also states that the Brompton Company have commenced the construction of a new ground wood mill and electric power station at a point known as the Upper Power, about half a mile above their present plant, where there is a 40-foot head available for development purposes. The company are proceeding with the installation of special pulp conveyors in their East Angus mill and, with other changes completed which the company have under way, the Brompton Pulp & Paper Company will have one of the most up-to-date pulp mill properties on the continent. Their holdings, at the present time, are about 275,000 acres, half stumpage and the balance freehold.

Countervailing Duty Removed from Pulpwood

To meet the new conditions imposed on May 1st by the Province of Quebec on exports of pulpwood, the United States Treasury Department has made a decision removing the countervailing duties of 35 cents a ton on print paper made from pulpwood cut from the Crown lands in that province.

Quebec was the one Canadian province which imposed an export tax of 25 cents a cord on pulpwood cut from Crown lands. The recent action of the province in prohibiting exports of pulpwood naturally annulled the tax on such exports. The Treasury Department's decision simply meets the new situation, removes the countervailing duties of 35 cents a ton on print paper and leaves pulpwood, wood pulp and print paper in the same situation in Quebec as has been prevailing in the Province of Ontario, which also prohibits the exports of pulpwood.

This decision means in effect that from both provinces print paper from pulpwood cut from Crown lands pays a tax of $3.75 per ton, the regular duty, plus the additional duty provided by the tariff bill, bringing the total duty on a ton of print paper from Canada to $5.75.

The same restrictions exist on the importations of wood pulp into the United States, as have existed before from both provinces. Wood pulp and pulpwood cut from private lands can be imported into the United States entirely free of duty, but the tariff on print paper made from pulpwood cut from private lands in Canada remains at the Payne law provision of $3.75 a ton.

Dominion Box and Package Company, Limited

The box manufacturing businesses of Messrs. Wm. Rutherford & Sons' Company, Limited, and the Montreal Wire Bound Box Company, have just recently been amalgamated under the name of the Dominion Box & Package Company, Limited. The offices of the new company will be located in the Canadian Express Building, and the officers are as follows: President, Wm. Rutherford; Vice-president, Shirley Ogilvie; 2nd Vice-president, Geo. H. Anson; Managing Director, S. F. Rutherford; Secretary, F. Sketon, Managing Directors, D. Lorne McGibbon, F. H. Anson, S. A. McMurty, Montreal; James Playfair, Midland, and C. A. Anderson and Cushing Adams, New York. The Wm. Rutherford & Sons' Company, Limited, will still continue to operate their sash and door factory and lumber business.

Personal and Trade Notes from Quebec Province

Messrs. Watson & Todd, Limited, have commenced the export of lumber from this port. This year their shipments will be extended to a number of Continental ports and they are also anticipating an excellent season's trading with South Africa.

The Riordan Paper Mills, Limited, have removed to their new uptown offices at 1 Beaver Hall Square.

Mr. E. H. Lemay was in Ottawa during the week.

The Montreal Lumber Company, Limited, will shortly move into new premises.

Mr. C. A. Spencer has returned from a trip through western Ontario.

The sash and door factory of Mr. Poudrier, at Black Lake, Que., was recently destroyed by fire, and with the lumber also destroyed caused a loss of approximately $15,000, only partly covered by insurance.

Reports from the West state that British Columbia lumbermen will take 2,000 men from Ontario, Quebec and New Brunswick, with their families. Lack of men is said to be seriously handicapping western mill men, and this move was recently decided upon at an important conference at Fernie, B.C. It is expected that at least 5,000 men will be taken out within the next few years.

S. P. Musson, Son & Company, Barbados, report under date of April 23rd as follows: Lumberstuffs—White pine—The only arrival during the fortnight has been the schooner Moravia, from Liscombe, N.S., with 102 M. feet, for which consignees obtained $30 and $22.50 for merchantable and second quality respectively. Market is strong and we can recommend shipments on a moderate scale. Spruce—No receipts, and as market is only lightly supplied, a couple of cargoes would sell well. Pitch pine—The trn, schooner A. H. Barteaux arrived on the 21st inst. from Scranton with 367 M. feet which had been contracted for some time ago. Shingles—Receipts consist of 93,000 Long Gaspe, which were sold at $4.82. No receipts of cedar laying, but a cargo consisting of 1,500,000 has been sold to arrive at $1.95. Shooks—The S.S. Coppename brought 318 bundles and the S.S. Korona 50 bundles, both of which were imported by dealers for their own requirements. Wood hoops—Receipts consist of 1,050 bundles by the Serrana, imported by a dealer .

A large quantity of very choice logs are being driven to the mill of Mr. J. Carew, at Lindsay, Ont. These logs were secured on the Kennedy farm in Ops and are said to be the finest that ever came into Lindsay. The logs are being driven in the old fashioned loose manner, as they have to be passed singly through the sluiceway at the locks.

LE ROI EST MORT—VIVE LE ROI

"The King is dead—with knell of passing day
He crossed into that bourne from which
No traveller, howso exalted, may return,
Leaving a nation—nay he left them all
Sorrowing that the world had lost a King indeed.

We who remain—
Following the ancient rule, may shout in time
"Vive le Roi!"—but for a cloud of years
There will remain a pungent sorrow in the words:
'The King is Dead.' "

Personal News of Interest to Lumbermen

Mr. H. T. Trotter, sales manager of the McNeil Lumber Company, Buffalo, N.Y., made a business trip through the Georgian Bay district during the past fortnight and also called upon the trade in Toronto. He reports much activity among the mills, and states that dry mill culls are growing scarce. At Buffalo, he says, trade is going along well, and hemlock is moving well. They are handling much more western hemlock this year than ever before.

Mr. C. A. Spencer, 55 St. Francois Xavier street, Montreal, made a business trip through Ontario during the first week of May, and included the "Canada Lumberman" in the list of those whom he favored with a call. He reports that he found spruce moving very well at fairly firm prices, and he expects to see an advance before long. One-inch dry spruce random lengths, he said, was going for about $19.50 under favorable conditions, and could be sold at $19 without difficulty. Two months ago it could be had for $17. Lath, he reports, to be very strong, No. 2 white pine selling at $3.60 for 1-inch and 1½-inch. No. 1 was selling at $4.35 for 1½-inch.

The Lumber Underwriters, of 66 Broadway, New York, have been fortunate in securing the services of Louis H. Parker, of Chicago, as deputy attorney and associate manager in their New York office. He at present is general agent at Chicago of the Svea Fire & Life Insurance Company, Limited, but has resigned that position to go to New York with the Lumber Underwriters. His experience as an underwriter and

Louis H. Parker, New Associate Manager, Lumber Underwriters, New York

general manager fully equips him to assume his new duties, and at the same time gives the Lumber Underwriters a man of unusual force and executive ability qualified to keep pace with the organization's growing business in their field of lumber fire insurance underwriting.

Lumber Golfers to Hold Tournament

The Lumber Trade Golf Association will hold its two days' annual golf tournament either on June 14th and 15th or June 21st and 22nd, at the Country Club of Springfield, Mass These annual events have been looked forward to with a great deal of pleasure by all lumbermen who play or who "play at" the game. There will be the usual number of prizes to be played for this year and special entertainment will be provided for the visiting lumbermen golfers, and especially for the lumbermen's wives who may accompany them. Notices will be sent to the members and also will appear in the lumber papers later, giving the full programme, etc. Mr. L. P. Rider, of 1 Madison avenue, New York City, is president, and W H. Smedley, of Frankford, Philadelphia, is treasurer.

The Canadian Trade and Commerce Department's weekly report gives the following list of importers of lumber in Newfoundland: E. H. & G. Davey, Job's Cove, off Water street east, St. John's Nfld.; Empire Woodworking Company, Limited, Water street, St. John's, Nfld.; Horwood Lumber Company, Water street St. John's. Nfld.; W. & G. Rendell, 75 Water street east, St. John's, Nfld.; Henry J. Stabb & Company, Water street, St. John's, Nfld.

Lumbermen Lose Freight Rate Case

Railway Commission Decides against Claim that New Tariff is Excessive on Domestic Rates—Export Charges to be Lowered

Ottawa, May 12.—An order of the Railway Commission was issued to-day dismissing the appeal of the Canadian Lumbermen's Association against the tariff schedule of the railways made effective May 1st, 1908, which increased rates from 25 per cent. upwards, in so far as the appeal affected lumber for domestic use. The railway companies are called upon to file a schedule, not later than June 15th, 1910, providing a lower general rate for lumber shipped to Montreal for export.

The order is a surprise to lumbermen who remember Chief Commissioner Mabee's statement that there was a substantial increase ($49,000) shown in the rates collected by the railways under the new schedule. This increase was shown to the satisfaction of the Commission last September. At a previous hearing the chairman had stated that if it were shown that higher rates were charged it would not take long to dispose of the case. The lumber interests inferred that their views prevailed to some extent with the Chief Commissioner. The reasons for the order are not yet known. It is signed by Assistant Commissioner D'Arcy Scott. The formal judgment, with reasons, will be delivered in a week or so.

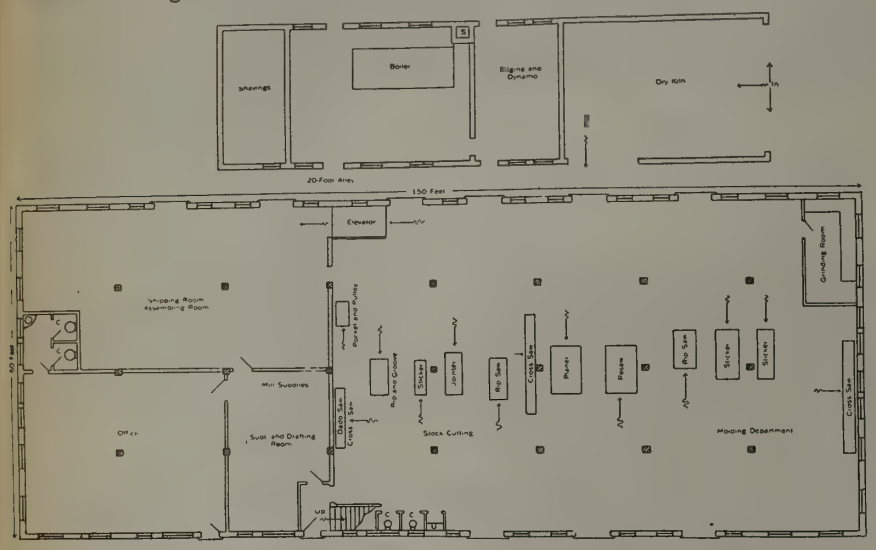
Since the new schedule took effect, there has been no more favorable rate for export than domestic lumber. Formerly the export rates were much reduced, as they are in the United States. If the old rates are restored there will be a substantial gain, but this remains to be settled. The C.P.R., G.T.R. and C.N.R. are the railways concerned.

Death of Quebec's Chief Ranger

J. C. Langelier, Superintendent of Forest Protection Service, Suddenly Called while on Tour of Inspection

Mr. J. Chrysostome Langelier, Superintendent of Forest Rangers of the Province of Quebec, died on May 7th. While on a tour of inspection at New Carlisle, Mr. Langelier suddenly became ill, and though his condition was critical for a while, he seemed to be recovering. Death came suddenly as a result of syncope. The deceased, who was 65 years old, was the son of the late Captain Louis S. Langelier, and brother to Sir Francois Langelier, Chief Justice, and Hon. Chas. Langelier. He leaves one son, Mr. Gus Langelier, and a daughter, Mr. D. J. Perry. Mr. Langelier had a well-earned reputation as being an expert authority on forestry and had written several valuable works on this subject.

Mr. Langelier was one of the ablest and most versatile of the representatives of a most distinguished family. He was born at St. Rosalie, county of Bagot, Que., in 1845, and was therefore 65 years of age. He was educated at the College of St. Hyacinthe, where he took a complete classical course. He studied law at Laval and Victoria Universities, and was admitted to the provincial bar in 1870, but never practiced his profession, as his tastes ran rather in the literary groove. Mr. Langelier took up journalism and edited "Le Courrier de St. Hyacinthe," "La Nation," "Le Canadien," etc., besides acting as a frequent contributor to the columns of "L'Election," "Le Soleil" and other well known and influential French newspapers published in the province. In fact, he soon became a power in the press, as well by his readiness and force as a writer, as by his wonderful knowledge of all the facts and information that bore upon the questions of the day, and by his untiring energy and industry. He published a great many valuable pamphlets on agriculture, colonization, railways and the resources generally of the Province of Quebec and of the Dominion. He knew practically every nook and cranny of his native province. No one was better acquainted with its forests, water powers and lumber trade, and he amply deserved the nickname of the "walking encyclopædia" which was applied to him by his friends. One of his most important publications was a paper on the "pulp industry in relation to our forests," which was read before the Canadian Forestry Association.



Mr. Langelier was of a most unassuming and retiring disposition. He might easily have entered the Legislature or Parliament, but repeatedly refused to become a candidate for public office. From 1887 to 1892 he occupied the important office of Deputy Provincial Registrar, during which time he compiled and published a "Description of the Surveyed Townships of the Province of Quebec," one of the most useful of the official blue books of the province.

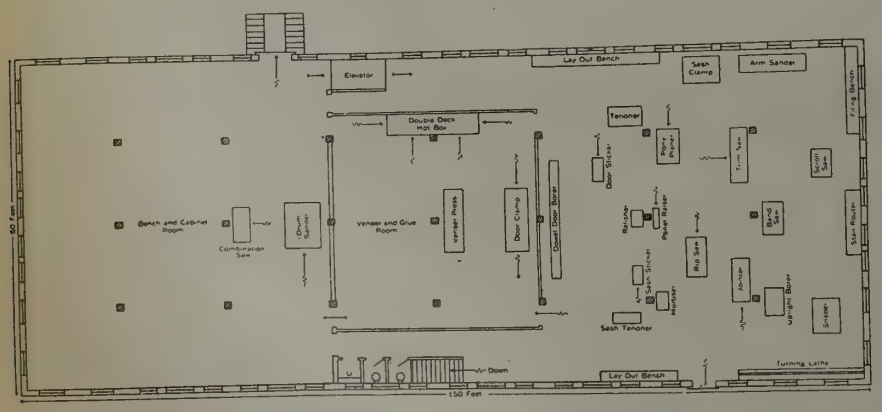
In 1897 Mr. Langelier was appointed Superintendent of the Forest Rangers of the province, and in that capacity displayed great ability, vigor and activity, besides carrying out a number of important reforms which contributed largely to the successful administration of the department of Lands, Forests and Fisheries. Mr. Langelier was an expert in all matters relating to the pulp industry. By his reports to the department and his writings in the press he did much to promote the interests of this industry. Both as a servant and as an important factor in the forestry movement of the day, Mr. Langelier will be greatly missed.

THE WOODWORKER

Plans for a Sash and Door Factory

A correspondent of the "Woodworker" recently asked for suggestions concerning a factory to employ 75 to 100 men. In the absence of more definite information for such a plant, as size of lot or ground, directions of streets, etc., and the kind of work to be done, the writer has taken it for granted that it is to be one to manufacture wooden articles

Buiding Material Factory.—First Floor Plan.



such as sash, doors, mouldings, frames, etc., such a line calling for a great variety in machinery and kinds of work to be done, the work ranging from common boards to high-grade interior finish.

To begin with, I have used the same dimensions as suggested. 60x150 feet, and the dry kiln in line with the planer. Note the arrangement of building supports and machinery, also the arrangement and size of doors. The writer has in mind that no material is to be carried, but for all long stock lumber trucks are to be used, and for shorter stock, after being cut, factory trucks are to be used.

The factory is to be two storeys high, with lower floor about 1 foot 6 inches above the surrounding ground. A small incline makes it possible to push a loaded truck into the factory and up to the machine, and work therefrom, without unloading and in turn reloading another lumber or factory truck. Note the arrangement of machinery and direct course from kiln or otherwise to planer, direct discharge for resaw, moulding or stock-cutting department. The arrows indicate the direction in which these machines receive and discharge the stock, ready for the next machine to receive it, without extra handling. Note also the central location of the elevator, making the route as short as possible for receiving and delivering materials. The location of stairs and superintendent's office is central and gives control to this official and saves steps in directing work.

At the second floor we unload stock from the elevator in either direction, also reload in the same manner, if desired, for unloading wagons, but as this is a two-storey factory, most of the finished stock will be loaded on wagons from chute, with side steps to wagon, and no elevator used. The writer has found this to be a very handy arrangement, and saves time.

The various departments explain themselves. Those using the larg-

Building Material Factory.—Second Floor Plan.

est volume of material are closest to the elevator. A new departure and a good one, is the veneer and glue room, centrally located for the convenience of the bench men It is also convenient to the sash and door departments. This feature is a money-saver, for as time goes on, more and more glue work will be the rule. Then, too, the temperature must be different for this room from that for other parts of the factory. The drawings will explain more readily than words.

Woodworking Machinery—Its Proper Care

By N. J. Millett

Give proper care to your machines and you will have less complaints to adjust. Spend more time keeping your machines at the highest degree of efficiency, and the surplus output of your plant will more than pay the expense.

How many hours will your machine run in a day of ten hours? Figure the maximum capacity of your machine, when running well, and compare this figure with your weekly production. If the percentage of time lost is greater than the percentage of money you care to lose on that part of the capital invested, find the reason why the production is not equal to the maximum capacity.

There are several reasons by which we lose efficiency on high speed machinery, and it would possibly be interesting to consider a few of these as briefly as possible. If the machine loses speed under heavy duty, the drive is not powerful enough.

If the stock is not jambed by the setting, and yet the feed travel decreases, the machine is not strong enough to do such work economically.

If you lose too much time setting the machine and taking care of the cutters, it would possibly pay to invest in shaped cutters and proper grinding tools.

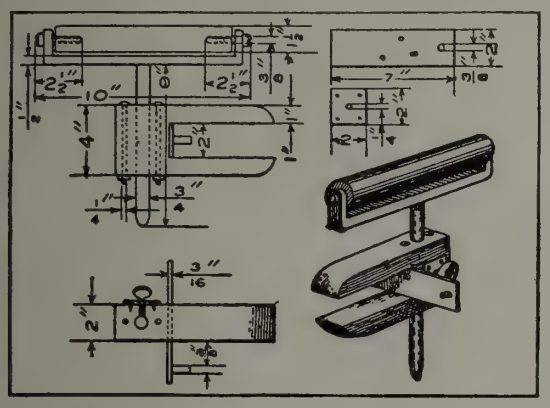
The operating shafts should be ground occasionally, box linings well scraped to have full value of bearing available.

Watch the oil supply. This is the "bug bear" of all machines. Good facilities for oiling are essential and the method by which the oil is distributed to every part of the machine is of great importance. This point is very often overlooked or neglected on cheap grades of machines, built to meet competition more than to establish a standard.

Give the belts special attention, as the drive is the most important factor on high speed machinery. A belt laced too tight will require unnecessary energy, wear the boxes and shaft faster, and ruin the machine in a very short time. If tight belts are required on a weak machine to operate, the proof is quite clear that the work is done at a disadvantage. On the other hand, if the belts are allowed to run too loose, they will slip or run off the pulley, and become damaged and defective in a very short time. It is advisable to keep records on belts in use, with details of their running. If in some particular place too much wear is noticed, investigation should be made to find the cause of the damage. It may be a shaft out of alignment, driving pulley too flat, or a rough casting too close to the belt to allow free travel.

If by accident a part of the machine breaks, make a close investigation of the damage to find the cause. If it is a miscalculation of the operator, take the necessary steps to overcome a second accident. If it is a weak part or a defective casting, repair it so that the machine will not lose strength or value. Make it stronger if possible.

In every case, a machine should be maintained in perfect running order and not allowed to "grow old." It can become out-of-date or superseded by a machine of better design, possessing greater facilities for operating, but the machine will always be able to do what it was intended for, providing it receives proper care.



Some Advantages of Electric Drive

One is impressed, in making a study of the various examples of electric drive in connection with woodworking machinery, that electric transmission is doing much to lighten and simplify the mechanics of such an institution. One can practically see the end of the old long lines of shafting, heavy belts and pulleys, and all the complicated tasks of placing machines and shafts so as to equalize strains and ensure steady running without hot journals and strained shafting, or other trouble here and there. Each machine and its driving apparatus is practically self-contained, and the belts are almost the same as the old machine belt proper, with the main driving belts eliminated. Of course, there come certain new requirements on the part of the millwright or designer of the plant. Sometimes he needs a certain kind of electric machinery, and also from time to time there are improvements in planers and other machines which call for special knowledge, and sometimes these improvements are more intricate than the older machines. Yet, with all that, with all the new ideas and complications involved in electrical machinery and improved designs in old machines, the task of preparing a setting for and setting up of a woodworking plant is much

simpler now than it was ten years ago. The machines themselves are not lighter, and there are always some heavy weights to handle, but the machinery equipment is lightened considerably by eliminating heavy pulleys and shafting and the belts that go with them. In fact, it looks almost like play to the old-time millwright when it comes to the modern equipment. There are very few belts over 6-inch in width, no shafting over 1 15/16-inch, and very little as heavy as that. Those who read history in the future will look back to views of manufacturing plants ten years ago, the modern ones of to-day and those of a few years hence, and wonder about the striking changes that have taken place, especially about changes which are due directly to the use of electric transmission for turning belts. They will see more light and greater simplicity of arrangement, each machine set where it is wanted, and not distributed so as to help balance up a line of shafting, or something of that kind.

Bench Roller for Handling Lumber

The handling of lumber on a bench can easily be accomplished with the aid of a small roller or bench support. The dimensions given in the accompanying sketch will make up a very good sized support. The roller is turned from hardwood and fitted with metal pins for axles, which turn in metal bearings made in a U-shaped piece of stake iron. A round pin is securely fastened to the centre of the U-shaped iron and the projecting end passes through a hole in the bench clamp and is adjusted with a set screw. The bench clamp resembles a carpenter's clamp and has a piece of 3/16-inch metal fastened with screws at the base of

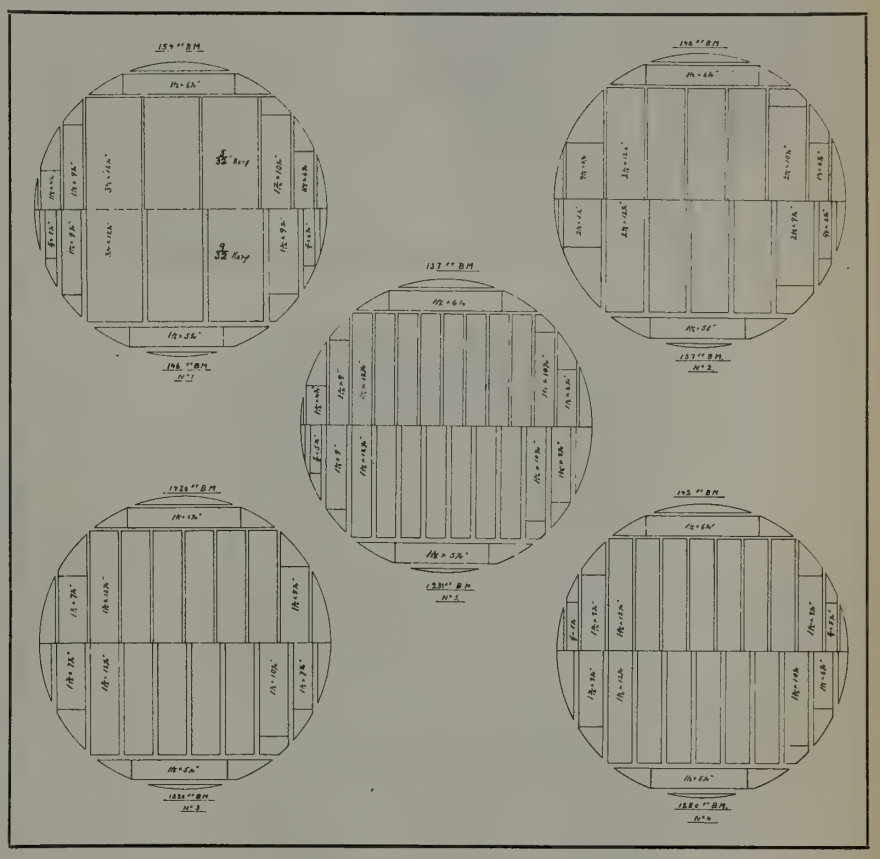
the opening, which has a metal pin riveted in one end. This pin is used to hold the support at any length on the bench. Holes are bored at various places in the edge of the bench to receive this pin, and, when the support is set and the pin pushed in a hole, the stock may be run over the roller instead of sliding on top of the bench.

Suggestions from Our Readers

Care of Double Cutting Band Saws—How Much Lumber can be Cut from 16 Inch Logs?

Editor "Canada Lumberman"—I noticed a few remarks in the "Canada Lumberman" recently which I would like to continue. The writer states his experience in double cutting band saws, saying that he had to make his lumber thicker to save mis-cutting or making some boards thin. I have looked after both, and I find that if the double cutting saw is properly put up for cutting, with a good carriage, so that there is no lost motion and well aligned, it will need no favors from a single cut. In my time I have seen single cut saws that would not make two boards alike. When a saw is working this way, either single or double cut, there is something wrong and before going too far, take a look around. Some filers, noticing that the lumber is bad, put more tension in the plate, whereas probably the saw is right, and by doing so they spoil it and abuse it so that it cracks. Then they say the saw is no good, when it may be the best.

I find it is better to look over everything carefully about the saw and carriage before trouble comes. You will seldom have trouble then, and will be able to make as good lumber with a double cut as a single, and a third more of it in every day of 10 hours that your mill runs. This I will guarantee to be right by experience.



A. E. Cartmill, Coldwater, Ont.

Editor "Canada Lumberman"—Quite recently a lumberman called me up, and said he had a quantity of choice white pine logs, which would average about 16 inches diameter. He asked me to tell him how much more lumber could be made from them if they were cut into 3-inch deal, than if they were made into 1-inch, 1¼, 1½ or 2-inch lumber. The saw he used was a 60-inch Hoe circular No. 8 gauge with No. 2½ bitts, which would take a kerf of 9/32 of an inch, in order to be correct as near as possible. I made five diagrams, the full diameter of the log, viz., 16-inch, allowing 1/12-inch over in the thickness, and ¼-inch over in the width of each piece, except the ⅝-inch, which I made ⅝ and reckoned them as ½-inch in thickness, but allowed ¼ in the width, the same as the other dimensions. Another query he wished answered was: How much more lumber would he have, were the logs cut with a 14 gauge saw. In order to answer both questions, I made the diagrams as shown, the upper half for the 14 gauge saw, and the lower half for the 8 gauge saw.

In the figures submitted below, I give the whole contents of each log, ⅝, 1, 1¼, 1½, 2 and 3-inch, in board measure. If any of your many readers have a better method of finding the contents of the above log, as here set forth, I shall be pleased to hear from them through the columns of your paper.

Contents of diagrams Nos. 1, 2, 3, 4, and 5, 1,000 logs, with 8 gauge saw: 3x12, 146,000; 2x12, 137,000; 1½x12, 132,000; 1¼x12, 128,500; 1x12, 123,500.

Contents of diagrams Nos. 1, 2, 3, 4 and 5, 1,000 logs, with 14

gauge saw: 3x12, 154,000; 2x12, 146,000; 1½x12, 142,500; 1¼x12, 142,000; 1x12, 137,000. Length of logs, 12 feet.

I. N. Kendall.

Canada's Trade in Forest Products

Canada's trade in forest products for the 12 months ending with February, 1910, amounted in value to $47,088,822. In previous years the values were as follows: 1909, $39,018,687; 1908, $44,126,797; 1907, 45,483,364. Exports for 11 months ending with February were as follows:

Articles Exported.	1909	1970 Total.	1970 To United Kingdom.	1970 To United States.
Logs	$ 863,657	$ 878,602	$ 36,262	$ 840,952
Lumber—				
Deals, pine	1,676,082	1,632,568	1,536,228	82,437
Deals, spruce & other	4,920,479	6,097,159	5,511,847	526,987
Laths, pilings, pickets	1,682,276	1,951,624	16,204	1,899,184
Planks and boards ...	18,040,313	21,674,554	1,357,221	16,538,450
Shingles	2,388,164	2,183,639	1,259	2,152,878
Timber, square	996,026	830,478	806,801	20,538
Wood blocks for pulp	3,930,930	5,635,879	.....	5,635,879
Wood pulp	3,877,814	4,581,378	821,962	3,667,279

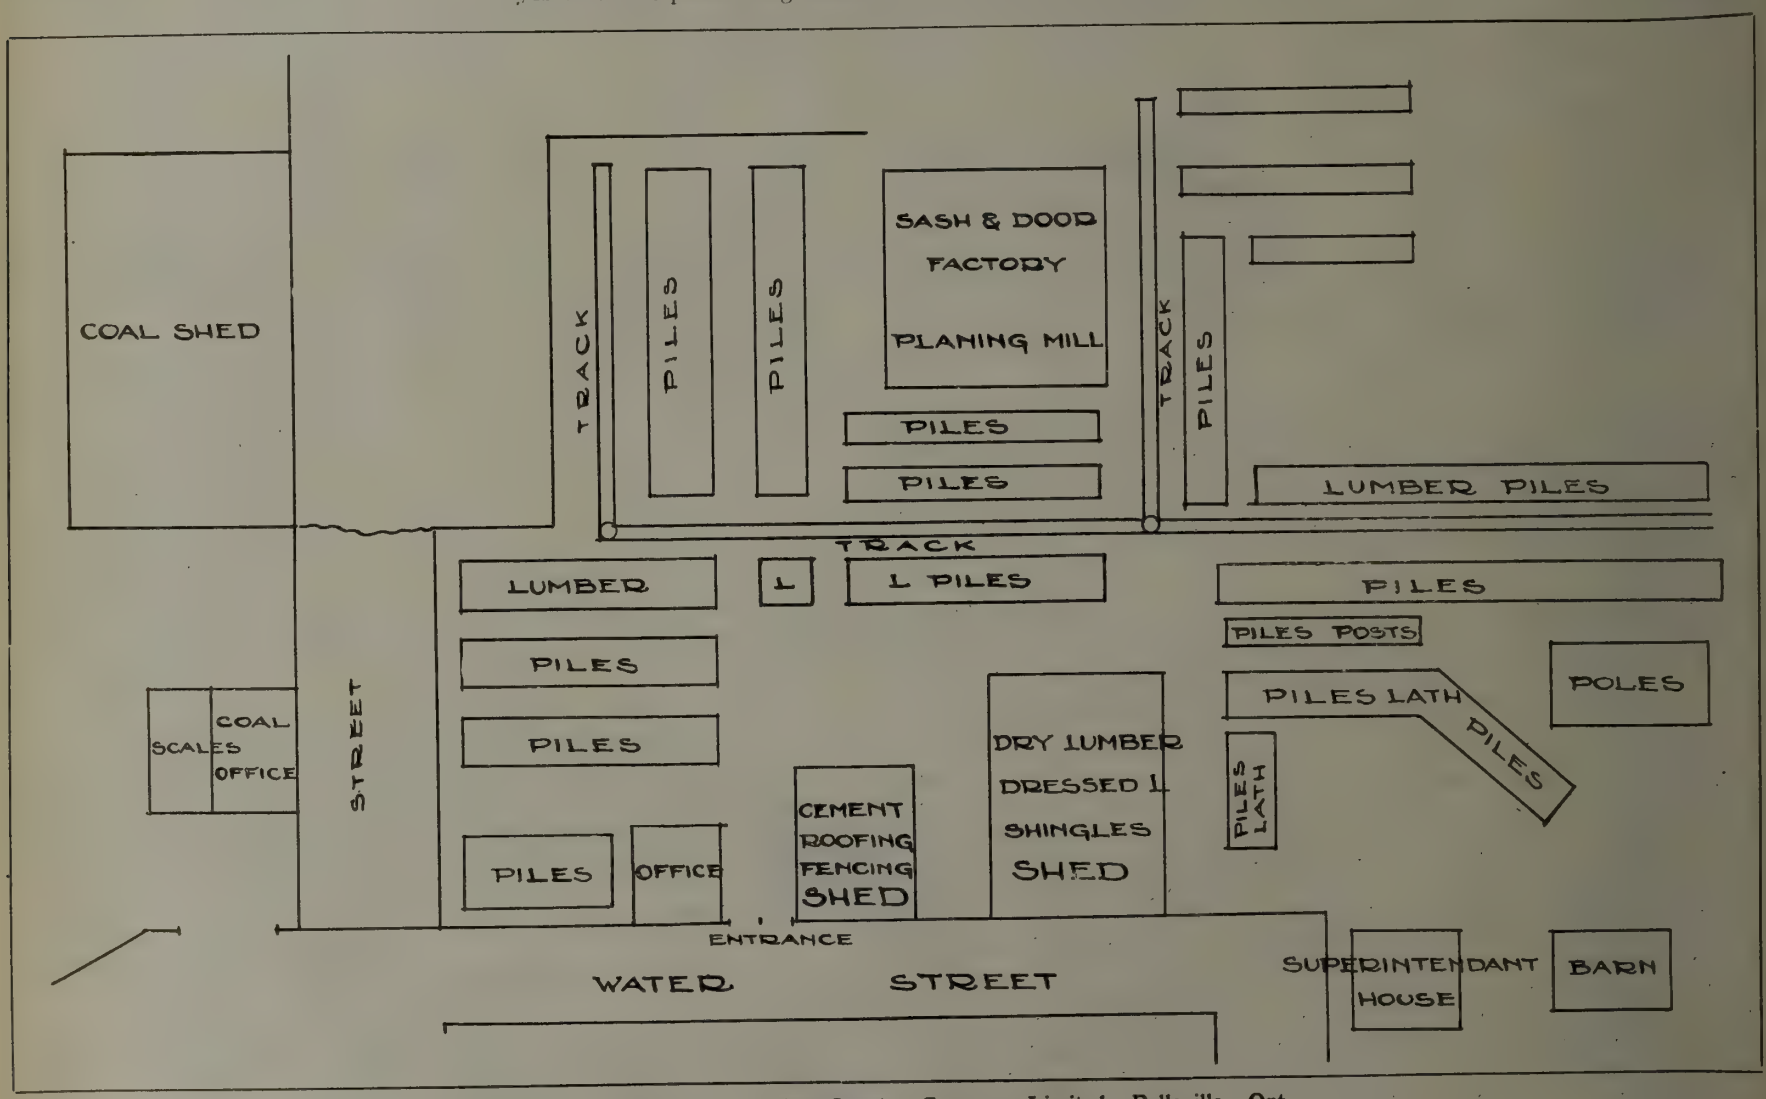
Total exports of wood and manufacturers of wood for the 11 months were valued at $49,605,277, against $41,389,902 in the same period of the previous year. Of this total the exports to the United States were valued at $33,127,650 and to Great Britain at $11,697,336

The imports of wood and manufactures of wood for the 11 months were valued at $10,000,776, against $7,681,365 during the same period in the previous year. Of this total $9,514,530 was from the United States and $221,234 from Great Britain.

The Canadian West Lumber Company, Limited, which is the name of the new company taking over the Fraser River Lumber Company, have just placed on the London market a loan amounting to about $7,000,000. The issue is £1,500,000 five per cent. first mortgage debenture stock at 88, repayable in 35 years.

The Retail Dealer and His Problems

A Pioneer Belleville Company—Well Laid Out Yard



G. H. Holton, Belleville, Ont.

In giving the history of the Holton Lumber Company, Limited, Belleville, Ont., one might as well tell the history of the city of Belleville, as since its formation under the name of Flint's mill in the dawn of the 19th century, many of the firm have risen to noteworthy public positions. Hon. Billa Flint, the organizer, was one of the original members of the Dominion Senate after Confederation. His son, J. J. B. Flint, who succeeded him in partnership with C. P. Holton, under the firm name of Flint & Holton, is a prominent lawyer who was police magistrate of Belleville for a quarter of a century, who sat in the council chamber as alderman for several years and who wore, as a climax to his municipal public career, the gold chain as the mayor of the city of Belleville. Mr. C. P. Holton, in 1885, bought out the other member of the firm and conducted the business for 23 years himself.

In 1908 Mr. Holton died and the business was formed into a joint stock company, known as the Holton Lumber Company, Limited, with Sir Mackenzie Bowell, K.C.M.G., Senator and ex-Premier of Canada, as president, and G. H. Holton, son of the late C. P. Holton, as secretary-treasurer and manager. The head office of the company is in Belleville, where they have extensive yards and docks splendidly situated on the shores of the Bay of Quinte. They can thus ship by water as well as by rail, as Belleville is a divisional point on the main line of the G.T.R. This firm conduct not only an extensive retail and wholesale lumber business, but have recently added an up-to-date planing mill and a sash and door factory, propelled by electricity. In addition to retailing lumber, lath, shingles, fence posts, slabwood, etc., they have a large trade in Portland cement, sash, doors, stair work, grill, verandah and cabinet work, building papers, fencings, felt and metallic roofings, etc. There is no outside capital in the company and it is solely through straightforward business methods that they have obtained their success.

The plant employs a competent staff of expert workmen and the output, which, it is said, is the largest of any lumbering concern in the midland section of Ontario, has a high reputation for excellence both of workmanship and material, among the trade, as well as among builders and contractors. In addition to the plant in Belleville, there are interests belonging to the firm elsewhere. It will be seen from the plan of the company's plant and yards which accompany this article, that their equipment is an excellent one and that they have secured an excellent arrangement of their yards, for carrying on their business effectively.

G. H. Holton, the capable manager and secretary-treasurer, whose portrait is published herewith, is a man eminently well suited to fill the responsible position. He is a native of Belleville. It might be said that he grew up amongst the lumber piles and, though not an old business man, he is one of Canada's young business men who has given evidence of sound judgment in his business affairs, and is considered by other business men of the city as an influential factor in Belleville's commercial circles.

Plan of the Yards of the Holton Lumber Company Limited, Belleville, Ont.

Mr. J. T. LePage, of Wabigoon, Ont., who recently took over the business of A. LeMay at St. Boniface, is running the yard as the LePage Lumber Company, so as to keep the yard separate from the manufacturing and wholesale business, which still continues as J. T. LePage. Mr. F. D. Poole, who is in charge of Mr. LePage's wholesale business at Winnipeg, and has general oversight over the retail yard, has had a long experience in the lumber business in Canada and the United States, and is recognized as a leading authority on all classes of lumber. Mr. LePage will shortly move to Winnipeg and make his headquarters there because of the increasing importance of that end of his business. He reports that he has on hand a good stock of dry red and white pine at Wabigoon.

Pointers on the Piling of Lumber

Modern Methods of Protecting Lumber from Damage by Weather—Economies that Count

Some day we will probably reach the point where practically all lumber purchased and carried in stock for manufacturing purposes will be carefully housed or piled under shelter so as to protect it from damage by weather, soot, and dirt. Some manufacturing institutions that use high grade stock are already housing quite a lot of their raw material, but the box factory, using as it does quite generally low grade lumber in large quantities, is not now in shape to even contemplate the idea of storing this stock under shelter. It is a matter of piling out in the open, and as the stock is rather low in grade anyway, too frequently the piling is carelessly done and much unnecessary damage to the stock results. It may not be so important to carefully pile low grade lumber as it is the higher grades and more valuable stock, but to-day it is worth while to pile even the low grades so that there will not be loss from exposure to the weather and improper piling that will amount to more than it would cost to pile it properly

There are two common sources of damage and loss to lumber after it is received in the box factory yard in connection with the piling. One is piling on board foundations down close to the ground so that the bottom of the pile damages from the moisture coming up out of the ground. The other is lumber damaged through lying around loose on the yard either because it is not properly piled up or stock from piles that have been partly torn down to get at certain lumber, and then left scattered about.

Begin with Foundations

The place to begin the campaign or system of proper piling and caring for lumber is with the foundations. In some box factory yards there is enough lumber damaged and goes to waste at the bottoms of piles from moisture to well pay the cost of putting in some good pile foundations. And speaking of good pile foundations, this is an expression that probably needs qualifying, too. Any pile foundations to be good should be up clear of the ground, and the ideal foundation should be built of something else than lumber or timber. Instead of throwing down a lot of cull boards or pieces of half rotten timber, the ideal in a pile foundation would be to make pillars underneath of some hard durable material, stone, brick or concrete. The concrete may be used either in the monolithic form or one may use concrete blocks. It is even better to use wood piles or posts and let the ends extend above the ground than to lay timbers flat on the ground. Then the ideal support for the lumber would be railway irons. Some old T rails. These may be put either on concrete, stone or brick piling foundations and they will furnish a permanent substantial support for lumber piles that are worth while and will keep the lumber up and dry. A good plan to follow is to start some idea of this kind in an empty corner of the yard. Where a pile or two has been cleaned out, put in a foundation of the ideal kind, put it there permanently and then keep on until in the course of time you will have practically the entire yard provided with excellent foundations. Then you will be in shape to start into saving all your lumber and keeping it in the best shape to work it. With straight, permanent foundations and a supply of piling strips, you should be able to pile low grade lumber so that instead of losing in quality much of it would improve or gain. Some that has already been exposed and become warped and crooked may by careful piling in this way be straightened out considerably and in the course of time be really better for the factory than when first received.

Sorting before Piling

In the matter of system and sorting and keeping up a lumber yard the plans differ in various box factories. Some sort lumber carefully as it is unloaded from the car. And this is an excellent plan, too, because the more thoroughly the lumber is sorted before piling the less likely you are to have piles torn down and scattered about the yard from time to time. The thorough sorting makes it so that you can find at any time any particular kind of lumber that may be wanted, and as it is in a separate pile of its own there is no need to tear down some pile to get a part of it. This is one of the strongest arguments in favor of carefully sorting lumber. It saves it from being torn down and scattered around to find some given thickness or width to fit a certain job. Also, it saves the time necessary to tear down piles and put them up again, so that really, sorting, even though it is made very elaborate and seemingly is very expensive, is much cheaper at the beginning when stock comes from the car than any other time.

There are a whole lot of things about the details of piling that might be gone into, but if one will start with the right kind of foundation and with the intention of piling the lumber so that it will get better instead of worse as it stays on the yard, these other details will suggest themselves right along and will need no emphasis laid on them. They will naturally follow in order. So, really, foundations carefully laid out are both the starting point and the inspiration to careful piling. Make a study of the subject, starting from the idea suggested herein. Study it in relation to your yard and the materials most convenient out of which to make foundations, then do some experimenting with it. Take some corner of your yard that has been emptied and start to work. It will not cost much to make a good foundation or two, and after you once make a start you will probably get so interested in the subject that you will continue without any further urging. And if you do, you will probably find that it pays just as well to have modern up-to-date pile foundations just as it does to have a modern mill and up-to-date machinery. —Packages.

Sudden Death of Mr. M. S. M. Long

Prominent Young Hamilton Lumberman Succumbs After Brief Illness—Close of a Promising Career

News of the death of Mr. M. S. M. Long, of the Long Lumber Company, Hamilton, Ont., will be received with regret by his many friends in the lumber trade. Mr. Long, who was one of the best known of the younger lumbermen of Canada, and who had already been most successful as a business man, died on Friday, May 13th, after an illness of only about two weeks' duration. Deceased was only 31 years of age. He was the head of the Long Lumber Company, wholesalers, and of the Consumers' Lumber Company, retailers, in which businesses he was associated with his younger brother, Mr. Guy H. Long. Mr. Long was

The Late M. S. M. Long

the son of the late George Long, who for many years conducted a successful wood and coal business in Hamilton. He was educated at the Hamilton public schools, the Hamilton collegiate, and the Hamilton Business College. At the age of 16 he found a position in a lumber yard. He was marked for promotion at once, and at the age of 19 was foreman of the yard. In 1901 the Nipissing Lumber Company was formed, and he was appointed secretary. He was engaged both at the mills and camps for three years, and in 1904 commenced business for himself as a wholesale dealer in pine and hemlock. His business expanded rapidly and he soon took his brother into partnership.

Mr. Long was prominently connected with the Masonic Order, being an officer of Acacia Lodge A.F. & A.M., and a member of Murton Lodge of Perfection, Rose Croix Chapter, and the Moore Consistory. He was secretary-treasurer of the Hamilton Driving Association and vice-president of the Hamilton Tigers Football Club. He also took an active interest in rowing and bowling and a number of other sports. His death occurred at the home of his father-in-law, ex-Ald. W. J. Macdonald, and was due to a complication of diseases. He is survived by his widow and one brother.

The Quebec Minister of Lands and Forests, Hon. Jules Allard, in his official report draws attention to the heavy loss by forest fires and states that the whole question of protection from fire losses will be taken up by the Government at an early date. It is their intention also to adopt the most modern methods of dealing with forest reserves.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope and stating number of enquiry:

703. Pine shelving—A South African firm desires to be placed in touch with Canadian shippers of pine shelving. This firm will be prepared to give a trial order of a car load to any firm guaranteeing the quality of their stuff; and large orders will follow if satisfactory. Payments cash against documents Montreal or New York.

708. Handles—A South African firm desires to be placed in touch with Canadian exporters of pick, hammer and axe handles. Quotations to be f.o.b. Montreal and St. John.

710. Furniture timber—A South African firm desires to be placed in touch with Canadian shippers of furniture timber, such as poplar, satin walnut, black walnut, oak. Quotations to be f.o.b. Montreal, and ocean freight rates to Delagoa Bay must be given.

711. Panelling and cornices—A South African firm desires to be placed in touch with Canadian shippers of panellings and cornices. Quotations to be f.o.b. Montreal, and ocean freight rates must be given to Delagoa Bay.

713. Handles—A South African firm desires to be placed in touch with Canadian shippers of pick, hammer and axe handles. Quotations to be f.o.b. Montreal, and the ocean shipping rates should be given to Durban and Delagoa Bay.

716. Handles—A South African firm desires to be placed in touch with Canadian shippers of pick, axe and hammer handles. Quotations to be c.i.f. East London and Durban.

726. Furniture timber—A South African firm desires to be placed in touch with Canadian shippers of furniture timber, such as walnut, figured oak, black walnut, poplar. Cash against documents London. Quotations c.i.f. Durban and Delagoa Bay.

727. Veneers—A South African firm desires to be placed in touch with Canadian shippers of 3-ply veneers. Cash against documents London. Quotations to be c.i.f. Durban and Delagoa Bay.

728. Table tops—A South African firm desires to be placed in touch with Canadian shippers of 5-ply table tops. Quotations to be c.i.f. Delagoa Bay. Cash against documents in London.

735. Pine doors, white pine, etc.—A South African firm desires to be placed in touch with Canadian shippers of pine doors, yellow pine boards (rough squared 12-inch, and from about 12 feet to 20 feet long), white pine, oak, walnut, black and satin walnut boards, maple flooring. Quotations to be f.o.b. Montreal and St. John, and ocean freight rates should be quoted to Delagoa Bay.

743. Birch planks—A Manchester firm asks for dimensions and prices of birch planks from Canadian exporters of same.

746 Pine ends—A Lancashire firm asks for prices of best pine ends, 3-foot up to 5-foot, from Canadian shippers of same.

747. Spruce lumber—A Manchester firm wishes to correspond with Canadian shippers of spruce lumber.

755. Roller blocks—A Manchester firm wishes to correspond with Canadian manufacturers of maple mangle roller blocks, and will contract to take 50,000 or 60,000 in the following sizes: 22-inch x 5¾-inch, 22-inch x 6½-inch, 23-inch x 5¾-inch, 24-inch x 6½-inch, 25-inch x 6½-inch, 26-inch x 5¾-inch, 26-inch x 6½-inch.

756. Maple logs—A Manchester firm desires to correspond with Canadian shippers of rock maple logs, and will contract in carload lots, dimensions 8-foot long and up, 80 per cent. to be 24-inch at small end and up, remainder not less than 22-inch diameter, and asks for price per ton c.i.f. Liverpool and Belfast. Also one carload of second growth rock maple logs, 7-inch to 9-inch at small end and nothing larger than 11-inch at bottom. Price per ton c.i.f. Liverpool and Belfast.

787. Pick handles, hammer handles and axe handles—A South African firm of hardware merchants desire to be placed in touch with Canadian shippers of pick handles 36 inches long, hammer handles 12 inches to 20 inches long, and axe handles. The firm would like to see a sample each of the two former. Ocean freight rates to Durban and Delagoa Bay.

788. Pick handles, hammer handles and axe handles—A South African firm who are agents for a large New York commission house, desire that Canadian exporters of pick, hammer and axe handles should communicate with their principals, quoting f.o.b. prices for these goods delivered to South African ports. Samples of the first two, both in hickory and ash, should be sent.

789. Canadian or red oak.—A South African Government Railway Department desires to be placed in touch with Canadian shippers of red oak for carriage building, etc. Quotations must be f.o.b. Montreal and St. John and ocean freight rates to Durban and Delagoa Bay must be given.

799. Birch and other square timber—A north of England firm manufacturing chairs and tables, make inquiry for the names of Canadian firms able to supply birch and other square timber.

817. Hammer handles—A South African firm of mining material importers desire to be placed in touch with Canadian shippers of hammer handles to fit English hammer heads. Ocean freight rates to East London and Durban.

818. Pick and axe handles—A South African firm of mining material importers desire to be placed in touch with Canadian shippers of pick and axe handles. These should be made of hickory, if possible, but otherwise ash will be taken. Ocean freight rates to East London and Durban.

Directory of Manchester Timber Importers

The principal importers of timber, etc., at Manchester are given by the Dominion Trade and Commerce weekly report as follows:

Timber—J. W. Southern & Sons, 38 Store street, London Road; Southern & Nephew, Collier street, Liverpool road; Wheeldon & Sons, Rennie street, Salford; J. & W. Bellhouse, Hulme Hall Lane, Miles Platting; Grant & Aldcroft, Lissadel street, Pendleton; Maddock & Tunaley, Blank street, Ancoats; H. Newsum Sons & Company, Trafford Park; Illingsworth, Ingham & Company, Whitworth street west; Peace & Norquay, New Islington; Imperial Lumber Company, Hanging Ditch; G. Evans & Sons, Limited, 761 Oldham road; Mallinson & Eckersley, Worsley street, Salford; Cooke, Laidham & Company, Royal Exchange; L. Lighthill & Company, Fawcett street, Ancoats; F. Parker & Company, Little Newton street, Ancoats; Felber, Jucker & Company, 29 Peter street, Manchester; R. A. Naylor, Limited, Warrington; R. & J. R. Creighton & Company, Limited, Alexandra Sawmills, Carlisle; W. Evans & Company, 132 Eccles New Road, Weaste; T. H. Helsby & Company, Ducie street, Piccadilly, Manchester, R. G. Tickle & Company, Limited, Blackstock Sawmills, Liverpool; James Lancaster, 40 St. Vilas Road, Blackburn; John Kelly & Sons, Limited, Little Newton street, Manchester; Wilson Bros., Bobbin Company, Limited, Garston, R. Bury & Company, Limited, Spencer street, Bootle, H. Hughes & Company, 12 Paradise street, Liverpool; F. W. Wilson & Company, 23 John Dalton street, Manchester.

Box Boards—Co-operative Wholesale Society, Limited, 1 Balloon street, Manchester; Crossfields, Warrington; Summers & Company, Stalybridge, Nr.; J. W. Southern & Sons, Limited, 38 Store street; H. Stephenson & Sons, Limited, Pollard street, Ancoats; Felber, Jucker & Company, 29 Peter street; G. W. Goodwin & Son, Ivy Soap Works, Ordsall Lane, Salford, Manchester; Maypole Dairy Company, Godlee; H. Nestle, Limited, Tulbury; Robinson & Sons, Limited, Wheatbridge Mills, Chesterfield; James Kelly & Sons, Limited, Little Newton street; J. Wheeldon & Sons, Regent Road Sawmills, Manchester; Ayrton Saunders & Kemp, 34 Hanover street, Liverpool; R. F. Sanderson & Company, Limited, 8 Peter street, Manchester.

Wood Doors—Illingsworth Ingham & Company, Whitworth street west; J. & W. Bellhouse, Hulme Hall Lane; Grant & Aldcroft, Lissadel street, Pendleton, Nr.; J. W. Southern & Company, 38 Store street; Felber, Jucker & Company, 29 Peter street, Manchester; R. A. Naylor, Limited, Warrington; J. Lancaster, 40 St. Vilas road, Blackburn; Collier & Proctor, 18 Kempston street, Liverpool; J. Wheeldon & Sons, Regent Road Sawmills, Salford; F. Parker & Company, Limited, Little Newton street, Manchester; H. Hughes & Company, 12 Paradise St., Liverpool.

Match Splints—J. Sankey & Sons. Bilston; W. J. Morgan & Company, Limited, Crumpsall Vale, Blackley, Nr.; T. Wilson & Company, 33 John Dalton street, Manchester.

Wood pulp—H. Newall & Son, Market Place; H. B. Wood & Company, Limited, Cathedral street; Werthein & Company, 3 Cross street; Kellner Partington Paper Pulp Company, 9 Newmarket lane; Blydt Paus & Pace, 137 Portland street; Olive Bros., 19 Cannon street; Andrews & Company, Cross street; Henderson Craig & Sons, 52 Corporation street; S. W. Royse & Company, Limited, 20 Albert Square; A. Rabey & Mather, Corn Exchange Buildings; J. E. Salvesey & Company, Limited, Corn Exchange Buildings; A. B. Wood & Company, 57 Hilton street; J. Kelly & Sons, Limited, Little Newton street, Ancoats, Manchester; Ayrton Saunders & Kemp, Limited, Hanover street, Liverpool; Robinson & Sons, Limited, Wheatbridge Mills, Chesterfield; A. Burgon & Company, Limited, 75 Sackville street; Premier Box Company, Worsley street, Hulme, Manchester; Blake & MacKenzie, Limited, Hanover street, Liverpool; H. Stevenson & Company, Limited, Pollard street, Ancoats, Manchester.

Paper Pulp Boards—W. Ibbotson, 21 Cannon street; H. & L. Slater & Company, 12 Dantzic street; Spicer Bros., 11 Lower Mosley street; W. Evans & Company, 3 Cross street; E. Hulton & Company, Withy Grove; A. B. Wood & Company, 57 Hilton street; J. Kelly & Sons, Limited, Little Newton street; A. Burgon & Company, Limited, 75 Sackville street; T. G. Nuttall, Commercial street, Manchester; Robinson & Sons, Limited, Wheatbridge Sawmills, Chesterfield; Premier Box Company, Limited, Worsley street, Hulme; Hugh Stevenson & Company, Limited, Pollard street, Ancoats, Manchester; Blake & MacKenzie, Limited, Hanover street, Liverpool.

Ash Boards, Squares, etc.—Harrison, MacGregor & Company, Albion Iron Works, Liverpool; F. Parker & Company, Limited, Little Newton street; Fitzgerald Bros., Ashton Old Road, Manchester.

Barrel Heads and Staves—P. Hickey & Company, 43 Oswald street, Manchester.

Picture and other Mouldings—S. Hildesheimer & Company, 63 Miller street; C. Rowley & Company, 5 Barton Square, St. Ann's Square; Horatio Davies, Ordsall Lane, Salford; John Heywood, Deansgate, Manchester; Boots, Limited, Nottinghom; Baxendale & Company, Miller street; R. Ashworth, 48 City Road, Manchester; J. Roberts, Limited, Bolton; J. Davie & Company, 31 Rochdale Road; J. R. Cohen & Company, 12 Dantzic street, Manchester; J. Lancaster, 40 St. Vilas Road, Blackburn; H. Hughes & Company, 12 Paradise street, Liverpool.

Timber Importers in the West Indies

The Dominion Trade and Commerce weekly report gives the following list of importers of lumber in the West Indies:

Barbados—Barnes & Company, Bridgetown; Collymore & Wright, Bridgetown; Herbert & Howell, Bridgetown; Manning & Company, Limited, Bridgetown; H. E. Thorne & Son, Limited, Bridgetown; Wilkinson & Company, Bridgetown.

Grenada—Martin, Dean & Company, St. George's; Thomson, Hankey & Company, St. George's; A. Hubbard & Company, St. George's; William Steele & Company, St. George's.

CAMP DEPARTMENT

King George as a River Driver

The succession of Prince George of Wales to the throne of Great Britain will recall to the lumbermen of Canada one of the most interesting and picturesque features of his visit to Canada. When the Prince visited Ottawa he was given a thrilling experience in the form of a ride upon a timber raft, down the boiling waters of a timber shoot. Every possible precaution was taken to ensure strength and careful guides for the raft on which the Prince was to rush down the shoot.

Only the immediate members of the suite and a few gentlemen, in all about 20, were allowed to make the trip. When these were fairly settled down, the Prince sitting on a raised plank, between the Duke of Newcastle and the Governor-General, the rope which held the mass of timber was cut, and instantly the raft began to move.

At first it went with a slow stately motion, but gradually as it entered the narrower parts of the shoot, where the incline began, the speed quickened, and everyone held fast as the first jump and steep descent drew nearer.

The following description of the event is reprinted from the version given by N. A. Woods, special correspondent of the "London Times":

"Before you could well say it was coming, the mass tipped up, and slid over the edge with an uneasy kind of gliding leap, like a huge porpoise, faster and faster till there was another jump, and then a straight run which plunged the beams under water, wetting some of the royal party to the knees.

"Quicker and quicker the banks flew by, all thronged with people cheering and waving handkerchiefs, and faster and faster the raft plunged down, groaning and creaking, now half hidden by the boiling water, into which it dashed at the end of each sheet, gliding rapidly along the logs of the straight runs with jerks and thumps, as if it was being forced over rocks, till it came to another steep incline, taking each one faster than the others in one grand long sort of flying whirl which gave it a motion of irresistible force, and made each passenger seem, as it were, a component part of raft, and rapids both.

"To go down the rapids of the St. Lawrence is nothing, but to go down the rapids of a timber shoot, to keep pace with the flying waters and see them hissing and rushing up over the raft beneath your feet, is the most exhilarating adventure in all the repertoire of American travel.

"It is something which partakes of flying and swimming; the immense speed of the whole mass—the rush of the waters, the succession of shoots stretching out far down beneath you, like sloping steps of stairs, the delight of flying over these with the easy skim of a board—the rough, long straights in which the raft seems to dive and founder and letting the water up and over it behind, until it is again urged forward, and their comes another incline of water which you whirl madly down as if you were in a swing.

"To steady yourself on the narrow plank amidships and hold on with might and main when the timber snaps and works like a bundle of weeds, getting a momentary rest with each quick incline, and again thumping over the straights with sharp, uneasy struggles, is to experience such a heap of new sensations as neither the Prince nor the Duke had known before; such a whirl as only three-quarters of a mile down the great timber shoots of the Ottawa can ever give.

"All on the raft with the Prince, to whom the sensation was as novel as it seemed beautiful and terrible, were delighted, and the only regret which His Royal Highness expressed when the raft did condescend to stop in the centre of the river below the falls, was that the shoot was not at least a mile longer."

A Strange Vehicle in the Lumber Camps

During the first months of this year a very peculiar yellow vehicle, something like a Noah's ark on runners, was seen at various points in the woods in the Parry Sound district, and later, in the woods north of Georgian Bay. When the cadge teamsters saw it in the distance they usually looked for the best turnout, and cleared the road, watching in silent amazement at is drove past. When, upon nearing a camp it turned on to a draw road, the "sandpipers" stopped work to gaze at it, and the same astonishment was visible when camp was reached, and a curious group would gather while the spokesman of the party would, in the polite phraseology of the woods, enquire: "What in hell do you call that rig?" or they would suggest among themselves that it was probably "a moving picture show," "a booze wagon," "a new fangled patent water tank," etc. After a hard passage through the water and slush on top of the ice in Lake Nipissing, when it arrived with the horses tails loaded with ice and the rig with a liberal coating of the same, the boys were sure is was a special fishing outfit.

When camp was reached and after a tent had been hooked to the sides, two bunks folded outwards and a fire started, amazement changed to admiration, expressed in some such happy expressions as "Well, I'll be d——— if that isn't the —— — —— completest outfit I ever seen in the woods," "Say, Jack, wouldn't that be a great rig for the drive?" Then possibly it would occur to one to seriously ask what it was anyway, and the reply that it was a Gospel van, and that the men in charge were missionaries, would cause some of the most profane to quietly retire from the immediate vicinity.

If the rig excited curiosity, the composition of the party aroused still more. The three men who assisted the leader had all been lumberjacks themselves, and a few years ago had been no better or less profane than the average lumberjack. The singer of the party was a blind man with an exceptionally good voice, "Jack Nicolson," of Bruce Mines, who lost his eyesight while prospecting a few years ago.

"There is no use your coming here to-day," was the first greeting at one camp when the party arrived. "Why not?" was asked. "Oh, you can't do any business because the clerk is away and there is no one to take up a collection." This opened the way to explain the greatest curiosity of all, viz., "That no collections were asked for anywhere," and by this policy the suspicious greeting was in this case, and in the others, changed into a hearty welcome, and Roman Catholics and all crowded into the meetings, and issued earnest requests to return again.

In conclusion, this movement to carry the Gospel to the camps is not supported by any church, though the members of the party are all church members. Neither, as some supposed, is it backed to any extent by wealth lumbermen. It is simply the result of the efforts of a few missionary enthusiasts who think the lumberjacks need the Gospel just as much as any other people. It would certainly pay the employers to encourage work of this kind. Anyone wishing more information should write to William Henderson, Burks Falls, Ont.

May Fine Railways for Forest Fires

An important meeting of the Forestry Committee of the Commission of Conservation, to consider the question of fires set by railways, was held in Ottawa on May 2. The following members of the commission were in attendance: Hon. Clifford Sifton, chairman of the Commission of Conservation; Senator W. C. Edwards, chairman of the Forestry Committee; Hon. F. L. Hassard, Premier of Prince Edward Island; Hon. W. C. H. Grimmer, Surveyor-General of New Brunswick; Mr Frank Davison and Dr. B. E. Fernow.

The committee recommended that the following sections be added to clause 297 of the Railway Act (Consolidated Statutes, 1906, chap. 37):

"In addition to the foregoing provisions, and any other provisions applicable thereto, and without affecting or impairing the same, or any of them, it is hereby declared:

"(1) For each and every case in which a fire is started by sparks from a railway locomotive, and either begins outside the right-of-way or spreads therefrom to the adjoining land, the company which is operating the railway at the time when the fire is started, as aforesaid, shall be liable to a fine of $1,000, to be recovered by summary prosecution before a stipendiary magistrate or two justices of the peace.

"Provided, that it shall be a sufficient defence against any such prosecution if it be shown by the railway company: (1st) That the company has used upon the locomotive the best available modern appliance for the purpose of preventing sparks spreading therefrom; (2nd) that no negligence has been shown by the engineer or fireman of the locomotive, or any other servant of the company, conducing to the starting or spreading of the fire, and (3rd) that the company has maintained a sufficient staff of fire rangers, properly equipped with all suitable appliances for fighting fire and efficient means of travelling from place to place along the line of railway, and that the said staff has been prompt and diligent in taking all possible means to prevent the fire from spreading."

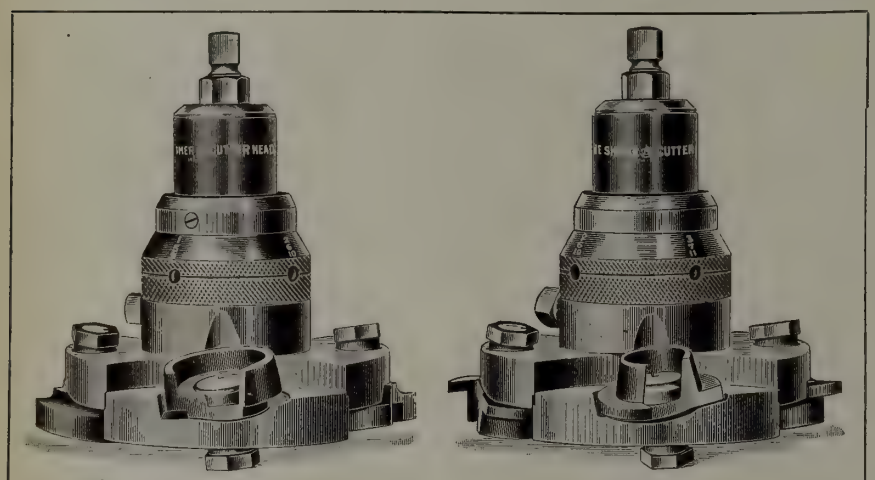
The committee further recommended that the Act Respecting Government Railways be amended to provide: "(1) That the Government railways maintain an efficient staff of fire rangers, properly equipped with all suitable appliances for fighting fires, and proper and efficient means of travelling from place to place along the line of railway; and (2) that the Government railways shall provide free transportation for all provincial fire guardians, properly certified as such, while travelling in the discharge of their official duties."

It was also recommended that the committee again press upon the attention of the Government the desirability of taking immediate action to form a reserve of the forest land on the east slope of the Rocky Mountains and afford efficient fire protection for the same.

Hon. W. C. H. Grimmer stated after the meeting, that legislation embodying these recommendations would be introduced at the next session of Parliament by the Commission's representatives in the House of Commons.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing



The Universal Use of Cutter Heads

The Shimer cutter head, which is a tool well known wherever wood is worked by machinery, has been on the market for about 40 years. Although the first heads were crude in design as compared with those of to-day, some of them are still in service and doing good work. The changes and improvements were only made gradually as a result of experiment and to meet the necessities suggested by practical use. The first heads were made principally for matching, and their use was gradually extended until almost every phase of machine woodworking is now attended to by Shimer cutter heads so as to save the time of the men and to make a more perfect product.

Experiment with different metals resulted in the adoption of the steel forging for the head proper. Steel with 60,000 pounds tensile strength is forged and shaped under a powerful steam hammer until the grain is further solidified and refined, making a tool which has no equal for strength. The adoption of this metal necessitated a change of methods in manufacturing and the establishment at heavy expense of a special department for their manufacture.

The Shimer cutter heads are made upon the interchangeable plan for quick changing from one class of work to another without altering machine guides or disturbing alignments. They are also made with a complete expansion feature whereby the cut of the bits can be expanded or contracted to suit different classes of work or material without taking the heads off the spindles.

All cutting bits are of high grade tool steel, tempered to file. They hold an edge exceptionally well in working wood of every class and their circular outlines maintain uniform shapes and patterns of the finished

Figs. 202 and 203 with Four Bits each and the Expansion Feature.

product. No filing or fitting of the parts other than that required to sharpen the bits, which requires about the same skill as that of filing a saw. These tools are manufactured only by Samuel J. Shimer & Sons, Milton, Pa., to whom those interested in having further information should write.

Simonds to Build a New Steel Mill

The Simonds Manufacturing Company, of Fitchburg, Chicago and Montreal, have completed plans for the erection of a new steel mill at Lockport, N.Y., which will enable them to double the capacity of their shingle mill at once and before long to increase the first Lockport output. The building is to be completed and machinery installed ready for operation on November 1st. The initial investment will be fully a quarter of a million dollars. This announcement will be of much interest to lumbermen, saw and planing mill operators, etc.

The new plant, by its central location, will serve as an economical distributing plant to the company's factories. In addition to the three plants and the new steel mill, the Simonds Manufacturing Company have branch houses at New York, Portland, Ore.; Seattle, Wash.; New Orleans, San Francisco, Vancouver, B.C.; St. John, N.B., and London, Eng. The Lockport location for the new steel mill was decided upon after considering all the factors of labor, power, land and water. On the item of power, the electric service direct from Niagara Falls assures the company a supply of flexible power such as it requires. The land secured by the company provides an opportunity for further enlargement. As to transportation, the plant will lie between the New York Central and Erie Railroads, having direct track connection with both, and a private siding for the company's special use. In addition to this, the Erie canal runs directly along the Simonds' property. The company will build at once 50 houses for their employees on the best lines that can be found for dwellings of that type

The first Simonds plant was established 78 years ago in Fitchburg, Mass. In less than a decade its business had extended to such an extent that a new plant had to be erected and the old one discarded. The new plant has been enlarged and is now feeling the strain of the excessive demand upon it. The Chicago plant, the steel mill, was erected in order that proper business advantage might be taken of labor, coal markets, etc. The Montreal plant was added to serve the demands for Simonds' products in the Canadian markets. Extensive as all this equipment has been, it is now found to be inadequate, and the Lockport plant has been built on lines to meet the immediate demands and provide for long future growth.

Miscellaneous Machinery News

"Berlin Quality" for May contains the usual amount of interesting illustration and description relating to Berlin woodworking machinery. The front page is devoted to a bright article upon Halley's comet, which is said to resemble Berlin machinery closely in that there is only one Halley's comet and only one Berlin line of woodworking machinery.

The Dominion Wrought Iron Wheel Company, Orillia, Ont., have favored the "Canada Lumberman" with a copy of their catalogue of detachable lumber trucks, lumber buggies, log and lumber wagons, etc., with wide-tire steel wheels. The products of this company are celebrated for their superior quality, strength and lightness of draft. The catalogue, with its illustrations and descriptions, will be of much interest to the trade.

The United States Graphite Company, of Saginaw, Mich., have issued an attractive booklet and an illustrated catalogue dealing with their products and properties, which will be of interest to everyone who uses lubricants. The catalogue explains clearly the importance of using amorphous or non-structural graphite, if perfect lubrication is desired. The booklet upon "Graphite Mining in Mexico" is extremely interesting and well illustrated.

Henry Disston & Sons, Limited, Toronto, have secured the contract for supplying the outfit of saws for the new plant of the Nepisiguit Lumber Company, Bathurst, N.B. The order, which amounts to about $3,500 worth of saws, includes the following: 6 60-inch circular cut off saws; 8 12-inch bandsaws: 8 8-inch band resaws; 6 38-inch solid tooth circular resaws; 36 20-inch chisel tooth edgers; 8 50-inch solid tooth twin circular saws; 36 24-inch trimmer saws; 10 36-inch lath trimmer saws; 28 12-inch lath saws; 10 20-inch lath bolters; 14 46-inch slasher saws; 230 8-inch gang saws.

Dayfoot Company Reports Good Demand for Boots

The firm of Dayfoot & Company, of Georgetown, Ont., manufacturers of river drivers', cruisers' and surveyors' boots, report business this year to be the best it has ever been in their history. The name of Dayfoot is well known all over Canada in connection with the boot and shoe industry, the business having been started in 1845 by the late J. B. Dayfoot, father of the present proprietor. In 1892 the firm name was changed to C. B. Dayfoot & Company, and with the introduction of new and up-to-date machinery they have been extending their business, until now the products of this firm are to be found from coast to coast. The secret of their successful business career, Mr. Dayfoot believes, is in the quality of the goods turned out. The best of material is used in their manufacture, together with the finest workmanship, and in no instance is quality sacrificed in order to meet competition in price. The firm anticipate putting out in the course of a few weeks a fully illustrated catalogue of their different lines of manufacture, which will prove a great convenience to their many patrons.

The blacksmith and woodworking shops of Messrs. Shields & Hatfield at Summerland, B.C., were destroyed by fire recently, with a loss of upwards of $4.000.

The following is a list of Canadian patents granted on March 15, 1910, of interest to lumbermen, and furnished by Fetherstonhaugh & Company, 5 Elgin street, Ottawa: Russel S. Smart, Resident:

124,420—S. Ashdown, Vancouver, B.C.; means for removing attaching logs or the like to a hauling tackle.

124,421—S. Ashdown, Vancouver, B.C.; automatic log releasers.

124,466—A. E. Hogue, Toronto, Ont.: sawing machines for sawmills.

125,162—Ben Roberts, West Bank, B.C.; combined saw sets and gauges.

125,180—Harry Wilson, Vancouver, B.C.; logging sheave blocks.

For the Camp

When purchasing your supplies of provisions remember that we make a specialty of this business and just at the present time can offer some lines at exceptionally interesting prices. If needing any dried fruits let us hear from yon.

Valencia Raisins
Evaporated Peaches
Currants
Figs
Prunes
Evaporated Apples

We have some choice Grocery Barbadoes Sugar that costs much less than the regular yellow.

H. P. Eckardt & Co., Wholesale Grocers
Cor. Front and Scott Sts., TORONTO

Tubular Boilers

Horizontal Tubular Boilers in all sizes from 10 to 250 H.P. for medium or high pressure.

High Pressure Tubular Boilers from 80 to 250 H.P. our specialty.

Vertical Boilers in all sizes from 4 to 60 H.P.
Locomotive Type Boilers from 25 to 100 H.P.
Larger sizes built to order.
Write for our new Boiler Catalogue.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted White Pine Pump Squares

Must be Quarter Cut

7"x7", 6"x6" AND 5"x5". HIGHEST MARKET Prices paid, also 2" and 3" Tank Lumber. Ontario Wind Engine and Pump Co., Toronto tf

Cargoes of Hardwoods Wanted

WE ARE OPEN TO PURCHASE CARGOES of Elm, Maple, Birch, Basswood, etc, straight or mixed, cut to order to be brought to dock here. McDonald-Rowland Lumber Co., Owen Sound. 12

Wanted

2 x 3—9 Hemlock or Spruce
3 x 4—9 Hemlock or Spruce
4' Plastering lathes, Hemlock or Spruce

Chas. F Felin & Co.. 325 Land Title Building, Philadelphia, Pa. 10

Birch Wanted

WE WANT TO CONTRACT WITH A number of mill men for their 1910 cut of Birch no stocks too large and none too small to consider. Write with full particulars, The London Lumber Co., London, Ont. 11

Lumber and Lath Wanted

WILL PAY CASH FOR LUMBER AND lath of all kinds, send us lists of anything you have to sell. Leak and Co., 18 Aberdeen Chambers, Toronto. 10

Wanted

LARGE QUANTITIES OF 1" SOFT ELM lumber, 6½ to 14 feet in length, for which special cash price will be paid anywhere in Canada. Correspondence solicited, J. S. Findlay, Owen Sound, Ont. tf

Wanted—C. and B. Winter Cut Basswood

WANTED 15 TO 20 CAR LOAD No. 1 COMmon and better white winter-cut Basswood to be plump, 1 inch thick when dry. For further particulars apply to Box 889 Canada Lumberman, Toronto. tf

Wanted

Birch, Basswood, Ash, Elm and Maple

WE REQUIRE THREE MILLION FEET 1" to 4", shipment when dry, can use LOG RUN DEAD CULLS OUT. Inspection at mill. Box 919, Canada Lumberman, Toronto. tf

Wanted Hard Maple and Soft Elm

WANTED FOR IMMEDIATE SHIPMENT two cars 2" and 3" Hard Maple Plank, also for shipment any time during 1910, up to fifty cars Soft Elm, 1" x 12" and up wide x 6½' 7' 8' 13' 14' and 16' long. Address Robert Bury & Co. Lock Box 408, Teeswater, Ontario. tf

Wanted

1½ INCH GOOD SOFT ELM 6" AND UP wide. Either dry or to be manufactured. Apply Box 976, Canada Lumberman, Toronto, Ont. tf

FOR SALE—LUMBER, ETC.

Cedar Ties for Sale

FOR SALE 1300 PIECES SOUND SMALL Cedar ties. Write Box 569, Lindsay, Ont. 10

Hemlock For Sale

FOR HEMLOCK BILL STUFF UP TO 30 FT. try Arthur Sherk, Whitehall, Ont. 12

Square Oak Timbers For Sale

FOR SALE HARDWOOD LUMBER OF ALL kinds. Wanted orders for Square Oak timbers 8 to 25'; and all sizes of Long Leaf Pine. Address Box No. 275, Fort Wayne, Ind. 13

For Sale

RED PINE PILES CUT TO ORDER AND loaded on Cars at once. Lenghts 20 to 60 feet, Diameter: any size. Apply to Papineauville Lumber Co., Limited, Papineauville, P. Q. 12

Wanted Lumber, Lath, Shingles Etc.

WANTED—FIVE MILLION FEET OF DRY Pine, Spruce and Hemlock Lumber, also Lath, Shingles and Posts. Address Box 964 Canada Lumberman, Toronto. 12

White Pine For Sale

OR ANY OTHER KIND OF LUMBER MAY be quickly disposed of by placing a small advertisement about it in this column. Canada Lumberman and Woodworker, Toronto, Canada. 10

For Sale

3 cars 1" Cottonwood Box boards 13 to 17"
4 cars 1" Commonwood, 1's and 2's
10 cars ⅝" Crating Spruce
5 cars 1" Qt. Red Oak, 1's and 2's
3 cars 1" Qt. White Oak, 1's and 2's
35 cars 1" Plain Oak, No. 1, Common

c Geo. C. Goodfellow, Montreal

For Sale

10,500 SAW-LOGS, MIXED (HEMLOCK, Spruce, Cedar, Pine and Elm). Also one carload of Telegraph Poles, 25 to 60 feet. Wm. Potter & Son, Tottenham, Ont 11

Tamarack and Spruce for Sale

CARLOAD 2" x 4" 10/16 SPRUCE: ALSO large carload 2" x 4" and up Tamarack, $15.00 M, good stock, McDonald-Rowland Lumber Co. Owen Sound. 10

FOR SALE

2500 CEDAR AND TAMARACK POLES suitable for Piles and Telegraph Poles, 25 to 50 ft. long, and 6 inches and up at top end. The Muskoka Wood Mfg. Coy., Huntsville, Ont. tf

FOR SALE—MACHINERY, ETC.

Machinery For Sale

1 42 in. Smith Sander
10 Bench Clamps
1 Grand Rapids box frame pulley boring bit
1 Patent Iron Vice
8 Work Benches
1 Hand Saw Filing Vice
13 Bench Trussels
1 Arm Sander
1 Woodon Rip Saw Table
10 Chain Clamps
1 Cut Off Saw
1 Swing Cut Off Saw
1 Transmission Rope Drive Equipment complete
1 48 in. Iron Pulley for Wire Cable
1 48 in. Wood Pulley, 2 grooves for cable

Practically all good as new. Apply Gold Medal Furniture Mf'g Co. Limited, Toronto. Ont. 10

Second-Hand Engines For Sale

1—Laurie Corliss 15 x 30 with 14 ft. 6 in. flywheel, Corliss gear with double eccentrics, fitted for indicator and complete with lubricators and valves, etc.

1—Brown Engine 13 x 34 90 R.P.M. 70 H. P. complete with usual valves, fitting and indicator piping.

1—Peerless Engine 11x10, 35 H.P., 283 R.P.M., two 4' x 12½" fly wheels, complete with usual valves, fittings and indicator piping.

1—Slide Valve Engine 10 5/16 x 24, 84 R.P.M. 10'x16" fly-wheel, complete with usual valves, fittings and indicator piping.

Apply for prices, etc.

Canada Paper Co Limited,
Montreal, Toronto or Windsor Mills, P.Q. 10

Machinery For Sale

1 Buzz planer 16 in. (Builder, H. B. Smith & Co., Smithville, N. J.)
1 Mortising Machine
1 Tenoning Machine
1 Large Glue Vat
1 Adjustable Arm Sander
1 Door and Sash Clamp, (McCregor Gourlay)
1 Sash sticker, (McGregor Gourlay)
1 Eight Screw Veneer Press
1 Combination Rip and Cross-cut Saw
1 Butting Saw
1 30 in. Double Surface Planer (made by Berlin Machine Works, Beloit, Wis.)
1 Railroad Butting Saw

The above machinery has only been in use about three months

GEORGE GORDON & CO., Limited
Cache Bay, Ont. 10

Machinery for Sale

SMITH SANDER 42", SASH CLAMP, POST boring machine, ten bench clamps 1½" screw, Grand Rapids box frame pulley boring bitt, patent iron vice, 8 work benches, hand saw filing vice, 13 bench trussels, arm sander, wooden rip saw table, sash sticker, 8 chain clamps. Gold Medal Furniture Co., Toronto. 10

Machinery for Sale

42 Smith Sander, sash clamp, bench clamps, swing saw, wood benches, bench trussels, Grand Rapids box frame pulley boring bitt, patent iron vice, arm sander, wooden rip saw table, chain clamps, cut off saw. All the above are in good condition and practically new. Gold Medal Furniture Mfg. Co., Toronto. 10

Machinery for Sale

50 H. P. MONARCH PORTABLE BOILER and 40 h.p. Engine, refitted, ready for work One 30 h.p., Bell portable Engine and Boiler on wheels refitted. One No. 0 light portable 3 block Saw Mill complete. The Robt. Bell Engine & Thresher Co., Ltd., Seaforth, Ont. tf

Second Hand Boilers For Sale

In good condition.

1 44 x 12	49 3"	tubes Dome.
1 48 x 11' 6"	52 3"	tubes Dome.
1 48 x 12	48 3"	tubes Dome.
1 48 x 13' 6"	39 3½"	tubes Dome
1 48 x 12	52 3"	tubes Dome.
1 54 x 12	52 3½"	tubes Dome.

Brantford, Canada tf

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion

PRACTICAL MILLFOREMAN DESIRES position; thoroughly experienced in millwrighting and the handling of men, Good references. Box 968 Canada Lumberman, Toronto. tf

WANTED—POSITION AS LUMBER INspector or foreman, seventeen years experience with large wholesale lumber firms. Address J. Hector Latour, Midland, Ont. 10

POSITIONS WANTED IN CONNECTION with the lumber trade can be easily found by printing your want under this heading. Canada Lumberman and Woodworker, Toronto, Canada. 10

WHOLESALERS—YOUNG MAN OF TWENty, education, ability and business experience seeks position with a reliable firm offering advancement in sales department. At present, head shipper and yard foreman of a thriving Toronto retail firm. Write Box 972 Canada Lumberman, Toronto 10

WANTED POSITION AS MANAGER OF company cutting about a million feet per season, by a well educated young man who can do his own bookeeping, blacksmithing, millwrighting and lumber selling. Can supply best of references from present employer. Address Box 973, Canada Lumberman, Toronto. 11

MAN WITH GENERAL KNOWLEDGE IN sash and door factory and planing mill, 12 years experience in lumber business from stump to office, can take off a bill of quantities from plans, figured the mill work speaks French and English, lives in Montreal, P. Q., desires a position Address Box 975, Canada Lumberman, Toronto, Ont.

WANTED CAPABLE AGENTS FOR RETAIL Lumber yards in Alberta and Saskatewan. State experience, age, whether married or single, references and salary expected. Box 1, Big Eddy, B. C. 11

BAND SAW FILER WANTS POSITION. Good reference. 159 Bradford St., Barrie, Ont.

SAWMILL AND LOGGING HELP WANTED openings for all kinds of experienced men. Send your address stating what position you can fill. It will be listed free of charge. Address W. A. Anstie, Secretary, Mountain Lumber Manufacturers' Association. Nelson, B. C. 14

WANTED PRACTICAL MAN TO TAKE charge of lumbering operations of pulp and paper mill in Quebec Province. English speaking man conversant with French preferred. Permanent position for right man. Apply stating experience, age, wages required also send references. Box 951 Canada Lumberman, Toronto. 10

BUSINESS OPPORTUNITIES

Capital Wanted

WANTED A LUMBERMAN TO INVEST $8000,00 in well established business. Apply Box 971 Canada Lumberman. Toronto. 12

Planing Mill for Sale

$5200 PLANING MILL FOR SALE IN A live Western Ontario town. A going concern at a sacrafice if sold at once. Good trade with local demand for side line. Address Box 967 Canada Lumberman, Toronto. 10

Agents Wanted

BRITISH MANUFACTURERS OF GRINDing wheels for sharpening wood saws are anxious to get into touch with parties in Canada who would be open to undertake the sale of these articles. Box 960, Canada Lumberman, Toronto. 11

Steam Saw Mill to Lease

ON CHATS LAKE, NEAR ARNPRIOR, capacity 30M feet a day, 10 hours, fully equipped with excellent piling grounds. For full information apply Box 963, Canada Lumberman, Toronto. 10

Planing Mill and Lumber Yard

A GOING CONCERN DOING GOOD BUSIness, good reasons. B. J. McCormick, Welland, Ont. 13

For Sale

1400 ACRES OF TIMBER CONSISTING of Hemlock, Elm, Birch, Ash, Spruce, Basswood, Cedar, Etc. 60 per cent. good Hemlock. A new saw mill at the railroad. For particulars apply Box 531, Orillia, Ont. 13

For Sale White Pine

TWO TRACTS OF FOUR MILLION EACH. One on open river close to Mills and to Georgian Bay. The other on the Canadian Pacific Railroad Price $15,000 each. Splendid bargains for small operators. Address J. A. Simpson, 99 Canfield Ave., Detroit, Mich. 11

Timber Limit and Saw Mill For Sale

WE OFFER OUR TIMBER LIMIT AND saw mill for sale together with machinery tools camps and camp equipment, about five thousand logs located 35 miles from Ottawa, This is a good opportunity for lumbering. Low Lumber Co., Low, P.Q. 10

For Sale

Saw and Planing Mill, premises and plant situate in the Town of Preston, which is one of the most progressive Towns in Western Ontario.

The following machines (comparatively new) with belting, pulleys and hangers complete comprise the plant.

1 Surface planer, 1 Dimension Saw, 1 Planer and Matcher, 1 Power-feed Rip Saw, 1 Swing Saw, 1 10" four side Moulder, 1 20" Jointer, Grinders, etc. Engine, Boiler and Saw Rig (inserted tooth saw) Capacity of Mill 10,000 feet.

Canadian Pacific and Grand Trunk Railway connections.

For terms apply to H. C. Edgar, Drawer A. Preston, Ont 10

Will sell reasonable on easy terms to right party. None but those meaning business need apply. For further particulars apply Box 943, CANADA LUMBERMAN, Toronto. 11

Asphalt as Lumber

The term "lumber" formerly was applied only to wood, but it has now been combined with the word asphalt to form a term so new as to be capable of copyright. It means a board-like product which, while composed of layers of a special long nbre felt saturated with a composition of asphalt, can be cut, worked, joined and nailed like wood.

This material, originally designed for roofing, and absolutely water and weather proof, is manufactured in a stock size, 36 inches wide and 6, 8, 10 or 12 feet long. The boards are made with a one inch rabbet, running full length on either side, enabling the material to be matched up readily and quickly, while a special asphaltic cement applied along the rabbeted joint makes the joints practically a part of the solid board. Such a material naturally has many wider applications than those merely of roofing construction, and it is available in all building operations demanding waterproof structure, capable of resisting heat or cold, and unaffected by the action of acids, gases, fumes, etc.

The material is compressed in the course of manufacture to such a solid consistency that it may be classed as a fire retardent, while it may be surfaced with sand, gravel, or mastic, as may be ordered. In the manufacture of asphalt board there are used four layers of saturated felt, three of parchmentized cellulose and six of cementing composition to which are added two weather coats applied to the outside.

Wood Preservation

A new method of treating wood has been invented and tried with much success in Australia. The essential part of the process consists in boiling the wood and allowing it to cool and absorb a saccharine solution, after which it is dried, rendering the wood thoroughly seasoned within a few days after cutting, increasing its strength, and stopping all warping and shrinking. The sap in the wood is driven out and replaced by an antiseptic, owing to the saccharine solution boiling at a higher temperature than water, thus making the wood impervious to dry rot and to the attacks of white ants and other parasites which prey on ordinary lumber.

During the past four years a number of pieces of lumber were tested by the Government of Western Australia in localities where white ants are very numerous. The treated pieces remained sound while the untreated ones were destroyed.

Supply of Hickory Decreasing

According to a report sent out recently by the United States Forest Service, the users of hickory have, during the past few years, become very much alarmed over the decreasing supply. So far it has been impossible to get accurate statistics either of the quantity of hickory remaining in the woods or of the amount produced and used each year. This is partly because a great deal of hickory is cut by small portable or stationary mills, which, after consuming the timber available in their immediate vicinity, are either sold or moved to new locations. Much hickory is also split into billets for spokes, handles, etc., instead of being sawed into lumber. Altogether, therefore, it is difficult to make even a fair estimate of the total hickory consumption. The National Hickory Association and the Forest Service have, however, secured some statistics which are significant. They indicate a consumption of about 132 million feet annually for special purposes, and the manufacture of about 200 million feet of hickory lumber, making a total of about 332 million feet.

American Sawmill Methods

Writing on the subject of North American Forestry, Prof. W. Somerville, Oxford, says: "At Ottawa, Vancouver, Victoria and elsewhere I had the opportunity of seeing large sawmills, and the rapidity and ease with which the largest logs are brought to the saw bench and handled there was a revelation. In most cases the logs are floated, in many instances for hundreds of miles, to the foot of an inclined plane, up which they are transported by endless chains to the saw bench. Even where floating is not the means of conveyance, it is found desirable to construct a pond, into which the logs are thrown from the trucks. The pond serves many purposes. In the first place it is the means of clearing the logs from adhering grit, it offers the most convenient opportunity of sorting the timber, and it is a suitable place of storage for logs that it is desirable to hold over for some months. From any lot of timber felled in a virgin forest a considerable proportion is 'pumped,' 'wormy,' 'foxy,' or otherwise defective, and to get the largest proportion of sound, or fairly sound, boards, the logs have to be frequently turned over on the saw bench. This is done by means of a steam 'nigger,' which takes various forms, but is often a great notched bar of iron that comes up from below the bench at the will of the operator, and turns over and otherwise manipulates logs weighing a ton or more, as easily and quickly as a man could move corks."

West Indian Timber Conditions

It is said that the islands composing the West Indies at the time of their discovery were covered with dense forests of mahogany, cedar and other valuable hardwoods. Parts of these forests, in the smaller islands, are still standing, according to a recent report of the Canadian Trade Commissioner. Two-thirds of Dominica, the largest of the leeward group, is still under virgin forest. Tropical forests are generally too damp to be subjected to fires. Certain concessions have been granted a large syndicate to operate the timber industry in the centre of the island. The undertaking includes the operation of light railways to bring the timber from the interior to the coast. Only a limited portion of the original forest exists in Antiqua at the present time, and no important belts of second growth are noticeable. Grenada, the spice island of the West Indies, according to the report, abounds in every description of tropical fruit trees, and has in addition an important area of virginal forest, consisting of mahogany, logwood and galba. The trees of the West Indian forests are for the most part ungregarious. A forestry department, acting with the Department of Lands and Mines, prepares regulations under which licenses are issued for obtaining timber and the valuable byproducts, rubber and balata. Greenheart, which is one of the most valuable timbers of this island group, is especially protected, and no tree can be felled without special license. Fire protection appears to be unnecessary on account of the absence of grass and undergrowth.

Woods and Forests of Jamaica

The physical features of Jamaica resemble those of Trinidad and of the other volcanic islands of the West Indies. Mountain ranges of great height, extending throughout the island along its greatest length, form its watershed. The areas of cultivation lie below the valleys and on the lowlands along the coast and on the rivers. The forest portions still remaining are in the interior and on the crests and slopes of the mountains.

In character the flora and forest trees are the same as in Trinidad, and occur in nearly similar varieties. Encroachments on the forest lands and clearing have gone on as in the other Antilles, due to the requirements of unsystematic cultivation and the pressure of population. The removal of the trees has been followed by the same irregular water supply and variability of climate. Forest laws have been slow of introduction, but at the present time a system has been developed which is accomplishing something in the direction of preserving what is left of the woodlands. The recovery of estates that have been leased and abandoned or in any way alienated from the Crown is one of the features of the present laws. The forests that remain on these estates are being conserved, and reforestation is progressing on the denuded portions. Already the good effect of the present law is being observed in the improved output from these lands and the increasing area now growing up into forest.

Logwood Largely Exported

Logwood was introduced into Jamaica at the begining of the 18th century, and has so taken root in the lower lands as to exclude all naturally indigenous species and to yield a large amount for export. Of late years the export has been largely met by the extraction of root wood, which is now found very valuable. The present export will probably be kept up as long as the demand outside continues. It generally acquires in from 10 to 20 years a diameter of nearly one foot, so that it is of easy and rapid growth. As a dye-wood it is inferior to that of British Honduras and Campeachy. The fustic is another tree of special importance in the island. Unlike logwood, it does not propagate itself to the exclusion of other species, and requires a longer time to arrive at maturity. The export of the wood is quite large. The trees are found of about 3 feet in diameter and of a height of about 60 feet. It yields a yellow-brown timber, which is close-grained and used locally in carriage building. Its export is chiefly as a dye-wood.

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario is at something of a standstill. Travellers who have been about the province during the last week report that retailers are very indifferent. In the months of February and March, business was exceptionally active and travellers were so optimistic in their talk that retailers, fearing an advance, laid in large stocks. The result was that for a short time the movement of lumber was even greater than it was three or four years ago during the good times. The pace was too fast to last and something of a reaction has set in. There is little likelihood of an increase in prices being made now. Manufacturers, being in close touch with the situation, will scarcely attempt to raise prices at present, as the market would not stand it.

The markets in the United States which take Ontario lumber are also dull. A Tonawanda traveller who spent some time around the Georgian Bay mills last week, stated that he was simply looking about to get an idea of the state of affairs. He was not doing any buying at all. The falling off in the demand will probably mean that prices generally will remain quiet until the fall, though, of course, an active building season may bring about a stiffening up. The indications at present, however, are that the building season will not increase the demand greatly. In some of the cities of Ontario, London for instance, there are a great many empty houses, which, of course, have their effect in keeping down the building activity. Lath, which were strong until a few weeks ago, are a shade easier now. Shingles are selling at $3.20 for 3X, but the trade is quiet. In western Ontario there is a little better demand for mill culls, the price for 1-inch to 2-inch being now $16. Mill run also are about $1 higher, at $32 for 1-inch x 12-inch and 1-inch x 13-inch. At Ottawa, pine good shorts, 1-inch x 7 inch and up, have eased off a little, from $40 and $42 to $38 and $40. Pine box boards are also easier. 1-inch x 4-inch and up, 6-feet—11-feet, are 50 cents lower, at $12.50 to $14. 1-inch x 3-inch to 6-inch, 12-feet—16-feet, are bringing $16 instead of about $16.50. 1-foot x 7-inch and up, 12-feet—16-feet, are about a dollar lower for good lots, selling at $15.50 to $17, instead of $15.50 to $18.

Travellers report a strong demand for lath. White pine No. 1, 1½-inch, is selling at $4.35, and No. 2, 1-inch and 1½-inch, at $3.60. An increase has taken place in the price of flooring. Manufacturers are asking $2 per thousand more for all grades of birch and maple flooring. There is a good demand for Quebec spruce in Ontario. Prices are about $2 a thousand higher than they were in March.

There is a great scarcity of high grade white pine in the Ottawa valley and prices are very strong. It is probable that advances will be attempted in the near future. Export busines is extremely brisk on account of the opening of navigation. The trade in 2X pine and cedar shingles is much improved. Prices range from $1.50 to $2, and permit of exports being made to the United States in spite of the increased duty. There is not much export in clear butts and 4X are also quiet. Low grade shingles are finding their way into the United States markets extensively. Birch and basswood are improving and the trade in ash and elm is moderate. There is a scarcity of hard maple, but the trade is quiet. Birch for flooring is in active demand at firm prices. Pine mill culls and dead culls are too numerous

The hardwood situation in Ontario is rather quiet owing to the scarcity of dry stocks. New stocks are not yet in shipping shape. Enquiries, however, are very good.

Eastern Canada

The log driving situation is the most interesting feature in connection with the lumber business at New Brunswick at present. The recent rains have swelled the rivers so that there is no longer any fear of a shortage of water for the drives. In some places, in fact, the opposite has been the case. Taking things generally throughout the province, the drive situation is favorable. A good demand for bank logs has developed at Fredericton, $15 per thousand feet being paid for deal logs. This is only of a temporary nature, however, and indicates the desire of manufacturers who are short of logs at this time of year to obtain a small quantity in order to keep their mills going until their own logs arrive from farther up the river. At Campbellton, N.B., a deal charter was recently made to the West Coast at 30s. 6d. per standard, a remarkably low figure.

Log driving throughout Quebec has been very slow and in many places there will be little water unless plenty of rain falls. The indications are that logs will be stuck for the season in many of the creeks.

New York reports a fair demand for eastern spruce and prices at mill points are said to be firm on account of available supplies being low. Yards are not buying much more than they actually need, preferring to wait until the season is a little older. The building outlook is somewhat uncertain. Spruce, hemlock, yellow pine and general building lumber are selling fairly well. Oak, ash, birch, chestnut and poplar are among the leading hardwoods. The balance of the list are also doing fairly well. At Boston there is a more active demand for spruce frames. 9-inch and under are reported as selling at $24. For quick delivery, $24.50 and even $25 has been obtained. Random is also stronger and in good demand. Sales of 2 x 4 have been made at $21 and $21.50. Spruce boards are improving. Shingles are only about steady. Some holders are looking for higher prices, but the buyers are holding off. Cedar extras are quoted at $3.40 to $3.50, but the outside figure is very seldom secured. Laths are in moderate demand. Dealers are asking $3.85 to $3.90 for 1⅝-inch, and sometimes $4. For 1½-inch there is a moderate demand at $3.50 to $3.60.

Western Canada

There is considerable concern among the lumbermen of British Columbia regarding the possible shortage in the supply of lumber for the prairie provinces. During the past six months the demand has been so extensive that many mills have been compelled to refuse orders for early shipment. On account of the early opening of the season, logging was interfered with to a considerable extent in Saskatchewan, reducing the probable cut by 25 per cent., which will throw an additional demand upon British Columbia mills. During the last two or three months, prices have been stiffening and the wholesale market is now from $3 to $5 higher than a year ago. While higher prices are expected, it is believed that the total output of western Canadian mills will be the largest in the history of the lumber industry. Reports from the Fernie district indicate that the mills are being worked to their fullest capacity to supply the demand for mining timbers and building. The export business from Victoria is increasing. Coast mills are running full time and large quantities of lumber are being shipped to the north, both on steamers and scows. Nelson reports an unprecedented activity in the lumber business of the interior. Many of the Canadian mills are working night and day. Laborers are reported to be very scarce. In the mountain district alone there are said to be at present vacancies for 1,500 sawmill laborers.

Great Britain

There is a good deal more business being done on the London lumber markets and business conditions are much more promising than a fortnight ago. The contract building trade is making more inquiries and the packing case requirements are fairly brisk, so that, taking things all round, there is an encouraging move in the right direction. Prices are maintained very steadily. Importers are not doing much in the way of forward buying, being satisfied to take chances on the market later on. The market is considered to be very sensitive on account of the high prices, which make everybody cautious in their buying. At Churchill & Sim's recent auction sale, 3 x 7 unsorted Quebec spruce sold at £8 10s. Unsorted Oregon pine, 3 x 12 and 3 x 9, sold only at 1s. and 3d., and 3/16 x 1-inch sawn laths at 8d. Plain boards also sold well. Some good stocks of floorings were offered and prices were quite up to recent sales. At Southampton, the timber trade is reported to be progressing on fairly steady lines with a further slight improvement noticeable in the building trade. Quite a variety of woods have arrived by liner parcel during the past fortnight at Bristol. Much interest is being taken in the inauguration of the new turbine steamship service of the Canadian Northern between Bristol and Canada. Sailings commenced on May 12th and will continue fortnightly.

A satisfactory trade is being done at Liverpool, though there is no indication of a boom. Some anxiety, however, is felt in regard to the effect of the disasters which have happened in the cotton market, as, upon the soundness of the cotton industry depends in a large measure the prosperity of the timber trade in Lancashire. It is too early at present to estimate the influence of this factor but it is assumed that it will have an important bearing upon many industries. Spruce deals continue steady. Stocks generally are of broken specifications which is usual at this time of year. Stocks of 11-inch and 9-inch deals are practically all of 14 feet and under. Supplies of 10 x 3-inch are plentiful and there is a fair quantity of 3 x 7 and 8-inch. The market is practically bare of anything longer than 18 feet. There is also a scarcity of 3 x 2-inch and wider, which are in good demand. The supply of 2½ x 7-inch has increased, but prices are still good. 3-inch scantlings in all widths are scarce and readily bought. Stocks of scantlings are mostly 2 x 4 and 6-inch and 2½ x 5 and 6-inch. Even these sizes are, however, not any too plentiful. The higher grades of Canadian pine deals are moving off better than formerly, and 3rds and 4ths are attracting some attention at current prices. The pitch pine market for arrival is practically stagnant. Birch c.i.f. values are firm and inclined to advance. Fresh logs are selling readily at slightly better prices. Stocks of plank are much reduced being composed entirely of 3-inch.

The imports at Glasgow are very small. The market has quieted somewhat during the past fortnight. Arrivals are quickly taken into consumption from the ship's side and stocks are steadily decreasing. Prices are maintained easily at the highest price. Pine deals and sidings

Why Not Have the Best?

To hold the confidence of your trade you must be able to back up all your statements with the goods, and that's where we can help you out. When you want anything in White Pine, Norway or Fir—and want it right—let us have your order. We can furnish any length from ten to sixty feet.

If there is anything on earth we pride ourselves upon, its the prompt way in which we fill orders.

Cleveland-Sarnia Saw Mills Co., Limited

SARNIA, ONTARIO

are scarce but the sales are not extensive. Spruce also is scarce and sales are only moderate, buyers being inclined to hold off on account of high prices.

United States

The spring rush is about over in the lumber markets of the United States but it is believed that the vast amount of building in progress will maintain a fair volume of trade throughout the season. Retail trade in northern pine at Chicago is quiet, the demand from the country being dull. Better business is expected towards the end of May. The city trade in Chicago is fairly active. Prices are well maintained and stocks are pretty well broken, but this will be altered on account of the opening of navigation and the arrival of fresh stock. At Buffalo, white pine is moving fairly well, the higher grades being most in demand. Uppers and selects are reported as saleable at whatever prices are asked, but the demand becomes decidedly weaker as the grade declines. The low grades are not expected to show any improvement until the box trade is doing better. At New York, the trade in white pine is irregular with prices unsatisfactory.

Hardwoods at Chicago have eased off a little in demand during the last fortnight, but business is still very brisk. Prices, however, are well maintained. The values for uppers throughout the list are steady. Plain oak is a little firmer and may possibly go still higher. The bad weather of late has interfered somewhat with logging operations and a curtailment of the output of oak, ash, cottonwood and gum is expected. Northern stocks are firmer. Birch and maple are better than the rest of the northern woods. Soft elm and rock elm are steady, but basswood is a little dull. At Buffalo the hardwood demand is still quite active and prices are strong. The greatest demand is for oak. On account of the scarcity of oak, chestnut and birch are being more freely bought. Elm, basswood and maple are quite strong and none too plentiful. The demand for hickory is rather light, though stocks are scarce. White ash is fairly active. Black ash is scarce. At New York, the hardwoods are stronger than the rest of the list, but the actual consumption is light. Beech is firm and scarce. Plain and quartered oak are a little firmer.

The hemlock situation at Chicago is steadily improving. Stocks at northern mills are reported to be broken, and also those in the yards. The demand for hemlock is improving by the firmer position of yellow pine and white pine. At Buffalo, the trade in hemlock is easy on account of plentiful supplies. The demand, however, is good and is increasing. West Coast spruce and cedar lumber at Chicago are in excellent demand and stocks are badly broken. There is a complaint on account of delayed shipments. At Buffalo, the demand for Pacific coast lumber is increasing. Trade is rather uncertain.

Shingles and lath at Chicago are dull and the curtailed supply from the coast has not had much effect. Dealers are asking $2.78 for Stars, but the price is about $2.73. Clears are selling around $3.24. At Buffalo, shingles have declined since the opening of navigation. The demand is still fair for the red cedar clears, though the cheaper grades and longer lengths are not much wanted.

Market Correspondence

Scarcity of Good White Pine at Ottawa

Ottawa, May 11.—Many of the highest grades of white pine are scarcely purchasable in the Ottawa valley at any price. The manufacturers have had their own way in the making of prices for this class of stock for several months. Quotations are strong, of course, but considering the dearth of the lumber sought they are moderate. Manufacturers and dealers very often refuse orders in preference to trying to get the stock looked for. This is a healthy sign for the price list, and some advances may soon be recorded in the quotations of nearly all the upper grades of pine. The orders that were held in the city for navigation are being attended to. This makes export exceedingly brisk. Some orders are waiting for American boats. It was announced by a private member in Parliament, two months ago, that New York canals were open to Canadian bottoms, but shippers are still of the opinion that the American barges had better take their loads. No authoritative statement on the matter has been received by the local transportation companies. They want a test shipment received on the other side before they can regord the American canals as open to them.

There has been a big improvement in the trade of XX pine and cedar shingles. Ranging from $1.50 to $2 per thousand, they can be imported into the eastern United States, freight and increased duty paid, and still be comparatively cheap. The export trade in clear butts and XXXX is quiet. The exporters of low grade shingles find that they do not have to meet the competition of similar stock from the lumber region of the western United States. The cheap shingles would not stand the long haul, and consequently the market is left pretty much to the Ottawa valley.

The demand for birch and basswood is improving. Ash and elm trade is moderate. Hard maple is scarce, but so little is used that the price is not affected. The sale of birch for flooring is on the increase and present quotations are very firm. Pine mill culls and dead culls are on the increase and dealers find sales hard to make. Mill owners assert that current prices are so low that middlemen will have to bear the losses if they cannot obtain a margin. The increased dues to be collected by the provincial Governments furnish reasons for maintaining the present prices to the wholesalers.

Mr. J. Fred Booth states that the water supply is abundant at the Chaudiere and reports splendid results from the dam built two years ago. The flow of water is increasing five or six inches a day from heavy rains of early May. The volume of north waters which last year flooded the mills and shipping yards will not be so large this season, and no serious result is looked for. The E. B. Eddy Company had reports from the Rouge and Upper Ottawa last week indicating the most favorable driving conditions. Ritchie Bros., of Aylmer, have 350,000 logs on the Petawawa river in two sections. The first lot is expected down in a couple of weeks. The season's logs are just reaching the mill of the Colonial Lumber Company at Pembroke, and that company will then run at full capacity.

The Canadian Lumbermen's Association made representations to Consul-General Foster of the United States regarding a ruling of the U. S. Treasury Department, effective May 1st, calling for a more detailed statement than heretofore attached to the consular invoices, accompanying lumber shipped from Canada to the United States. The new regulation permits of the same invoice being used for several cars as before, but calls for tally sheets showing the actual lading of each car. The proceeding necessary in the absence of these sheets would be to unload the cars and measure the lumber before it was released from bond. It would have to be unloaded and loaded again, entailing a lot of expense. The Ottawa valley lumber is sold f.o.b. Ottawa, so that at the outset, at least, the importer would be the loser. In time, no doubt, the exporter would have to make allowances for this extra outlay, so that it would be in the interest of all parties to have the extra handling of lumber obviated. The Consul-General told the "Canada Lumberman" that he had forwarded the views of the Canadian lumbermen to Washington, and up to May 7th had received no reply. In the meantime the Ottawa exporters have supplied forms of specifications which have passed muster with the American Customs officers, and it is possible nothing further will develop from the ruling.

Hon. W. C. H. Grimmer, Surveyor-General of New Brunswick, who was in Ottawa this week, expressed the view that the inquiry so far made into the question of prohibiting the export of pulpwood from the Crown lands of his province did not warrant the reports current to the effect that New Brunswick was likely to follow the example of Quebec in this respect.

Owing to the funeral of Mrs. Albert MacLaren, wife of the president of the James MacLaren Lumber Company, of Buckingham, the business places of the town closed on April 30th. A special train from Ottawa brought a number of friends to the funeral. Among the lumbermen were Senator W. C. Edwards, Peter Whelen, E. S. Leetham, R. G. Cameron and W. H. McAuliffe.

Ample Water for New Brunswick Drives

Chatham, N.B., May 4.—Since last writing the most important feature of the lumber industry, the log driving, has changed materially. Instead of a scarcity of water, as was reported a fortnight ago, there has been ample water in the brooks and rivers for driving purposes. A week of almost continual rains was responsible for the change. During that time, the water rose rapidly and the progress with the drives thus made possible saved the lumbermen of the St. John river, the Miramichi and the Restigouche from having a general hang-up of their logs. The water in the St. John reached its highest point on the 29th of April, and then began to fall rapidly. During the ensuing six days, it continued to fall, and at present writing it looks as if more rain would be needed to ensure the getting out of all the drives. However, conditions are not such as to cause great anxiety. Good progress has been made with the drives on the St. John and its tributaries and, at this stage, even a moderate rain helps a great deal. A number of drives have already reached safe water. The Scott Lumber Company, of Fredericton, received word some days ago that their drive, consisting of 2,000,000 feet, was out on Cranberry brook, which flows into Magaguadavic lake. J. A. Morrison, of Fredericton, has received word that the rear of his drive has reached Sweeney's, and is now practically in safe water. On the Nashwaak river, the Nappadoggan drive, consisting of 5,000,000 feet, is out into the main river.

William C. Noble notified A. Cushing & Company, of St. John, the owners of the logs in his drives on Baker brook, some days ago, that he expected to get out into the main St. John river without difficulty. J. R. McLaughlin is out of Three Brooks into the Tobique with his drives.

Charles Miller's drive on the Tobique is out of the brooks and it is expected will be gotten out into the main St. John without difficulty. John Kilburn, who takes charge of the drives of several St. John mill owners on the Quebec branches of the St. John river, has notified the

Lumbermen

Who are critical in their demands always find in our method of selling direct to the regular trade, the close attention to the minutest details so absolutely impossible to secure when buying haphazardly.

To provide for filling all our orders promptly and satisfactorily, we have large and well assorted stocks on hand constantly—a feature that can hardly help pleasing you.

We want to prove to you that we are different from the others in many ways.

Hugh C. MacLean, Ltd.

Confederation Life Building, TORONTO

owners of the logs that he had, up to the end of April, experienced good driving conditions and that his logs were all out of the brooks.

Conditions for driving on the Miramichi, following the week's rain, were very favorable, but during the last week in April cold weather set in and the water along the river fell four feet. These conditions retarded somewhat the progress of the drives. While conditions are not yet critical, more rain would greatly expedite the work. The drives on the Tabusintac and Bartibogue and all the other important down-river branches of the Miramichi, are out into the main river. Of the up-river branches, the drives are all out of Sabbies river and Cain's river into the southwest boom. Lynch's drive on Salmon brook is also out. The Miramichi Lumber Company have their drives out of the Sister's and Trout brooks ,and their Taxis river drives are also well under way, while a number of the other more distant drives are considered practically in safe water, there is no such volume of water but that a hang-up of a great volume of logs is quite within the possibilities, as the water in the Miramichi and its branches, during the past few days, has been just high enough to make driving possible by hard work.

On the Restigouche there is a good volume of water for driving, and many of the drives have already reached safe water. For several days following the heavy rains of a fortnight ago, the rush of water was so great that the logs were held in the booms with great difficulty. It is estimated that 30,000 pieces worked through the booms. Some of these were picked up about Campbellton, but a large quantity went to sea and were lost.

The strike of the workmen at Stetson, Cutler & Company's mill at St. John came to an end a week ago after the men had been out about ten days. The strikers demanded an increase of 10 per cent. in their wages, but resumed work at the old rate.

A record price for bank-logs has been paid at Fredericton, the figure being $15 per thousand feet for deal logs. Although this would indicate a great demand for logs, it is not so important as might be judged. The eagerness to obtain these logs is due to the fact that there are always manufacturers who are short of logs at this time of year, who require only enough to keep their mills going for a few days days until their logs arrive from farther up river, and who will pay even such an extravagant price rather than shut down their plants and have their crews scattered.

Your correspondent was informed a few days ago that a deal charter had been made from Campbellton, N.B.. to the West Coast at 30s. 6d. per standard. This is probably a record figure, at any rate a remarkably low one.

The steamer Whitefields arrived at Newcastle on the Miramichi on May 1st to load lumber. The Whitefields is the first steamer to load on the Miramichi this year.

U. S. Paper Men Anxious About Pulpwood

At the recent meeting of the American Newspaper Publishers' Association its president was instructed to send the following statement to Congress:

"As a result of a strike in the mills of the International Paper Company the price of news print paper for transient needs has advanced approximately $9 per ton within the last five weeks, a condition approaching a paper famine is imminent. What is aggravating the situation is the official announcement of the Province of Quebec that pulpwood cut from Crown lands after May 1, 1910, cannot be exported. The American supply of pulpwood is almost exhausted. Many of the American mills are dependent upon Canada for their supply of raw material, so that the action of the provincial authorities of Quebec brings to the print-paper industry of the United States a menace which the special committee of the House of Representatives, after a ten months' consultation, seeks to avert by its unanimous recommendation for legislation.

"If the final action in adjusting this print-paper matter with Canada is deferred for ratification and approval by Congress until next winter, it is probable that the newspapers' loss due to this will represent millions of dollars. We ask that you promptly act on the bill proposed by the chairman of that committee, James R. Mann, authorizing the free entrance of wood pulp and printing paper from Canada, providing all restrictions on the exportation of pulpwood and wood pulp are removed. The good faith of Congress was pledged to adopt the recommendations of that special committee."

Charles Bates, Goderich, Ont.. reports as follows: "Trade with me just at present is quiet, with prevailing prices fair. I make fruit barrels but until the season opens up I am pressing hay. A heavy frost here recently formed ice on the river from one-half to three-quarters of an inch thick and as the fruit buds were well advanced the frost may have injured the coming crop."

The Dominion Cooperage Company, Brigden, Ont., say: "Business with us at present is just moderate though somewhat better than at the same time last year. No. 1 stock prices are fair, but No. 2 prices are very low. We are, however, looking for better trade later on and think the demand will be very good this year."

Extract from Letter received from Eastern Canada

GENTLEMEN :—

We received your No. 2½ Chisel Tooth Saw and have tested it very thoroughly and are pleased to write that it is the most perfect saw we have ever had. The tension is the finest. It is the only saw we have ever had to stand up and do good work with the heavy feed we carry.

We are sending you saws of another make and would ask you to hammer them the same as the one you sent us.

When we need new Saws, you get the order.

This was a Burns No. 2½ Chisel Tooth Saw giving satisfaction under very heavy feed

EDGINGS

Ontario

Culliton Brothers' sawmill at Loon Lake, Ont., is now complete.

P. A. Mackle & Son, woodworkers, Toronto, Ont., have assigned to N. L. Martin.

H. A. Clemens Company, Limited, Guelph, Ont., lumber merchants, are stated to have assigned.

The Hope Lumber Company, Thessalon, Ont., are building a large boarding house for the accommodation of their employees.

Fire which broke out on May 4th in Robert Balcom's lumber and planing mills at Vienna, Ont., destroyed the entire plant. The loss is partly covered by insurance.

The Herman H. Hettler Lumber Company, of Chicago, have secured an extra provincial license to carry on business in Ontario, with capital limited at $250,000.

T. Harrison, of Kenora, states that the mill will give employment to a large force of men this year and will be in full operation all summer as a good supply of logs is on hand.

The Rodney Woodenware Company, Limited, Rodney, Ont., have been incorporated with capital of $15,000. The incorporators are J. J. Mistele and G. R. Whitton, merchants, and L. Miller, wood merchant, all of Rodney, Ont.

Mohr & Company, of Killaloe Station, Ont., whose mill is located at Barry's Bay, Ont., have installed a new band mill which carries a saw 6 inches wides, 18-inch—19-inch gauge, with a saw kerf of 3/32 of an inch. This mill is to replace a circular saw and the company expect by means of it to effect a saving of 15 to 20 per cent.

The Foley-Rieger Pulp & Paper Company, which has recently been established at Thorold, Ont., will shortly re-open the factory which was formerly used by the Artistic Wood Turning Company. Mr. E. P. Foley, of the new company, has been for several years manager of the Davey pulp mill at Thorold and has been unusually successful in his work.

Fire recently destroyed the planing mill, store and heading factory of John Pierson, of Stevensville, Ont., together with all the contents, including a quantity of valuable machinery and a large stock of lumber, some of which was partly manufactured and the balance stored in piles. Mr. Pierson carried no insurance and the loss will be heavy, being between eight and nine thousand dollars. The property destroyed included a new saw costing $180 and a quantity of oak lumber worth $300.

The Dominion Salt Company, Limited, Sarnia, Ont., a new incorporation with a paid-up capital of $100,000, will operate the plant purchased a month ago from the Empire Salt Company at Sarnia. The purchase was made by the Cleveland-Sarnia Sawmill Company, and the new incorporation is affiliated with the latter company. Mr. J. M. Diver, of Sarnia, is president, and the management will be in the hands of Mr. C. H. Rogers, formerly treasurer of the Dominion Salt Agency of London and secretary of the Empire Salt Company.

The Owen Sound Lumber Company, Limited, which was recently incorporeted with an authorized capital of $50,000, will take over the business formerly conducted by Mr. H. E. Rowland under the name of the Owen Sound Lumber Company. They will engage entirely in the wholesale lumber business, selling principally to furniture and implement manufacturers in Canada and the United States. Mr. Rowland's business had assumed large proportions and he was unable to take care of all the business offered. The new company will be in a position to handle the increased business and also develop new lines of trade. The provisional directors are Mr. H E. Rowland, Mr. W. Sherriff, formerly of Taylor & Pringle Company, who will be secretary-treasurer of the new company, and Mr. J. Rowland, who has been identified with his brother in the business since its inception two years ago The offices will continue to be in the new Kilbourn Block.

Eastern Provinces

G. A. Grier & Son, lumber manufacturers, of Montreal, Que., have dissolved.

The Austin Lumber Company, Cap St. Ignace, Que., have sold part of their assets.

It is reported that Mr. Menier is about to build a large pulp mill on the Island of Anticosti.

F. M. Pope & Son, lumber merchants, Bury, Que., have registered, F. M. Pope and Osborne L. Pope.

The William Rutherford & Sons Company, Quebec, Que., have been incorporated with capital of $60,000, to carry on the business of manufacturers and dealers in lumber, wood, timber, etc.

The Eagle Lumber Company, Limited, Montreal, have secured permission from the Dominion Government to increase their capital from $20,000 to $90,000. The increase consists of 1,400 shares of $50 each.

The option which outside parties had on the lumber business and properties of William Richards & Company, Limited, Campbellton, N.B., was not exercised. After it expired on April 1, they were given until April 15th to buy, but on that date the parties could not come to terms and the deal fell through.

The Laurentian Chemical Company, Montreal, has been incorporated with capital of $590,000, to produce and dispose of products and by-products obtained by the distillation of wood, etc., and to carry on the lumber industry. The incorporators are A. D. Gall, Westmount, Que.; R. Prefontaine and F. E. Lovell, all of Montreal.

The Manitoba Land & Timber Company, which was recently organized with headquarters at Montreal, owns 30,000 acres on the line of the C.P.R. about 45 miles east of Winnipeg. They intend to cut the timber and haul it to Winnipeg and also to operate a portable sawmill. Senator MacKay, Randall Davidson and others of Montreal are interested.

One of the largest timber limit sales recorded in Quebec in recent years was completed at Sherbrooke recently, when the Champoux Company sold to the Brompton Pulp & Paper Company all their river limits in the St. Francis

river and Quebec central districts. The limits comprise about 18,000 acres of land and a fine mill at D'Israeli. The price will be fixed by two arbitrators.

Application is being made to the Lieutenant-Governor in council of New Brunswick for the incorporation of the A. E. Hamilton Company, Limited, to take over the woodworking business of A. E. Hamilton, St. John. The stock will be $50,000 ordinary, in $100 shares, and $25,000 preference in $100 shares. The provisional directors are. A. E. Hamilton, St. John, contractor and woodworker; Thomas Nagle, St. John, managing director of Thomas Nagle Lumber Company, Limited; Stephen B. Bustin, St. John, barrister; J. Willard Smith, St. John, ship broker and commission merchant; Stanley E. Elkin, St. John, manager of the Maritime Nail Works.

The Swedish-Canadian Lumber Company have purchased from Curran Bros. their large mill at Rexton, N.B., formerly owned by J. P. Jardine, as well as their timber limits, chiefly on the Kouchibougac, and last winter's cut of lumber. The price paid is said to be in the vicinity of $70,000. The Swedish-Canadian Company some time ago purchased the O'Neill and Vaughan timber lands on the Richibucto river, which they have been operating during the last winter, and their cut will be sawn at the Rexton mill, this making a large and busy season. In all, they will handle about 6,000,000 feet. Frank Curran, of Curran Brothers, will be manager of the company at Rexton.

Western Canada

M. McIntyre, lumber merchant, Phoenix, B.C., has sold out to C. A. Ross, Rossland, B.C.

Robinson & Lequime, of Grand Forks, B.C., who operate a mill on Smelter lake, have this season cut nearly 80,000,000 feet of logs up the North Fork.

Arrangements have been made by the West Lumber & Supply Company to open a fully stocked lumber yard at Shell Brook, Sask., at once under the management of Mr. W. B. Crombie.

Mr. E. H. Heaps, the well known lumberman of Vancouver, B.C., is president of a new company called the A. B. C. Elevator Company, which has taken over the Canadian-Mexican Steamship line.

The mill of the Yale-Columbia Lumber Company at Cascade, B.C., will be worked time and a quarter during the present season so far as is known, but may over-run this as the season progresses.

Fire broke out in the Rogers sawmill at Creston, B.C., recently, and resulted in damage estimated at about $10,000, partly covered by insurance. The company will at once start to build a new mill.

Preparations are being made at Stamp River, B.C., for the erection of a large sawmill in that district which will employ a large force of men and open up another portion of the country tributary to Alberni.

The Fraser River Lumber Company, Limited, Fraser Mills, B.C., made a new shipping record recently, when in one day they loaded off 32 cars and received 40 empties, making 72 cars handled by the shipping department.

The McClelland Lumber Company, Limited, has been incorporated in Manitoba with capital of $40,000. The head office is to be in Winnipeg. The directors include R. Burritt, G. S. Alexander, H. A. Dangerfield and J. Doolittle.

It is reported that another sawmill, with a capacity of 50,000 feet a day, is to be built at Nakusp, B.C. Cleveland, Ohio, capitalists are said to be interested. The company have already secured extensive limits on the Kuskoonaux creek.

There will be an increased demand for British Columbia Timber limits this summer, according to Mr. H. R. Earle, a Detroit, Mich., broker, who visited Vancouver recently for the purpose of negotiating the purchase of various tracts of timber.

The Cranbrook Sash & Door Factory, Cranbrook, B.C., are about to build a new mill alongside their old one and erect a new dry kiln. The new mill will be fitted up with the latest and best machinery, including a re-saw, rip saw, new moulder, double surfacer, two planers and matchers.

The Edmonton Lumber Company's mill at Strathcona, Alta., was totally destroyed by fire recently. Mr. W. H. Clarke, manager and part owner, places the loss in buildings, machinery and lumber at $20,000, with only about $5,000 insurance. The loss on machinery alone amounted to about $10,000. The mill will be rebuilt at once.

The British Columbia Gazette gives notice of the incorporation of the following companies: Seaboard Timber & Trading Company, Limited, capital $25,000; the Shortreed Shingle Company, Limited, capital, $10,000; the M. P. Cotton Company, Limited, capital $100,000, to carry on all or any of the following businesses: contractors, builders, dealers in brick, timber and other building requisites.

The Michigan Prairie Lumber Company and other large business concerns of Victoria, B.C., are endeavoring to arrange for the introduceion of a system which will give them direct rail connection with the E. & N. This, they claim, should be possible without inconveniencing anyone, and would enable them to handle orders from outside points much more expeditiously. The necessity of this, it is pointed out, is evinced by the fact that the lumber companies are so rushed now that it has been necessary for most to keep their plants in operation night and day.

Fire destroyed the Deschamps sawmill, planing mill and yards at China creek, near Rossland, B.C., recently The sawmill and planer were under one roof, and the fire started on the roof of the planer, the entire plant being destroyed, together with 1,000,000 feet of dry lumber in the yards, ready for shipment. The loss is $35,000, the insurance carried amounting to $8,000. J. S. Deschamps, sole proprietor of the business, will build a temporary mill at once in a new location near the site of the plant that was burned. Mr. Deschamps bought out his partner, Mr. Bleu, about two months ago, the firm formerly being Bleu & Deschamps. The business was established seven years ago.

The second detachment of French-Canadians to be taken to the Pacific coast to handle lumber for the Fraser River Mills is being recruited in Quebec by Rev. Father W. P. O'Boyle, who will secure 30 married men and induce them to go to British Columbia. Father O'Boyle is on his second trip of a like nature, and with the experience gained from his previous visit will be in a position to make even more satisfactory arrangements than the previous time. When the first party of Quebec workers went out last year, it was found there was a number of single men among them, and while they were as good workers as their married brethren, they are not considered as likely to become a fixture in any one place. The French-Canadians who go west under Father O'Boyle's guardianship will find ready-made homes awaiting them on arrival, and will have everything made easy and pleasant for them.

For Sale to Close an Account

Crown Granted Timber Limits and Lands

in the

Province of British Columbia, Canada

The undersigned has received instructions from the owners who desire to close the account, to sell by private treaty

Forty Timber Limits and Lands

situate in the Salmon River Valley, West Kootenay, British Columbia, from thirty to forty-five miles north of the United States border, and upon, or contiguous to the Nelson and Fort Sheppard Railway which runs between Spokane, Washington, and Nelson, British Columbia, connecting with the Great Northern and Canadian Pacific Railways, and affording access to the United States and Canadian markets.

The limits contain in the aggregate thirty-eight thousand acres, and are comprised of bottom lands and benches of hills, constituting one of the best bodies of timber in the Central Southern part of British Columbia. Subdivision of the tract has hitherto been consistently refused. Individual limits contain from two hundred and fifty to twenty-one hundred acres, with from three million to forty-five million feet of Cedar, Pine, Hemlock and other woods of excellent quality upon them, in addition to large quantities of Cedar Poles—prices run from $5,000 up according to Stumpage and Location.

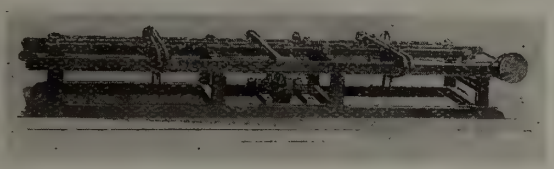
Some of the limits are essentially Cedar Pole Propositions, and contain large quantities of the very best quality of Cedar Poles from twenty-five to seventy-five feet in length, free of limbs.

The properties are Crown Granted, and the timber upon them may be exported. The Timber is subject to a Royalty of fifty cents per thousand feet, when cut.

A considerable quantity of the land is available for fruit land when cleared, and the owners are prepared to give a deed of land and timber, or a license to cut timber only for a term of years, at the option of the Purchaser.

TERMS OF SALE:

In order to close the account, very easy terms of purchase will be given, namely, twenty-five per cent. cash, and the balance in four equal annual instalments, and twenty per cent. cash with balance in six equal annual instalments—interest at six per cent.—with operating privileges which will assist purchasers to pay for limits out of stumpage.



The character of the properties together with the easy terms of payment present a unique opportunity to persons of moderate means to acquire valuable limits for either operation or investment.

Prices and further information may be had upon application.

KEBO BALATA BELTING

KEBO is the only Balata Belt in which each individual ply of canvas is treated with adhesive solution, and is compressed singly.
Hence there are no "weak spots" in **KEBO**, the plys do not come apart, the belt is absolutely waterproof, and will outlast any leather belting.
Every foot of **KEBO** belting we sell is backed up by the strongest guarantee we can give.
Is the belt you use as good? Let us tell you more about **KEBO**

Planing Matching Ceiling Flooring Novelty Siding Mouldings

We make the best line of medium size Planer, Matcher and Moulders on the market. When you buy a Cordesman-Rechtin Planer, Matcher and Moulder you are assured on four points:

1st—That you are getting the latest and most improved machine built.

2nd—That you are getting a well designed, well made machine, and one that won't give you any sort of trouble.

3rd—That you are getting a machine that will do good work and lots of it.

4th—That you are getting a machine that is fully guaranteed.

We make four different sizes and styles of these machines. One of these is sure to meet your requirements.

Write for circulars giving full particulars

The Cordesman-Rechtin Co.

Jeffrey Conveyers

for Sawmills and Woodworking Plants

Partial view of Jeffrey Wire Cable Conveyer, 1830 feet centers, recently completed for the Anglo-Newfoundland Developement Co. The wood is delivered to storage by cable on the upper run and reclaimed by the return cable which travels through a tunnel underneath the pile as shown.

Send for our illustrated supplement 57B. It contains descriptions of modern methods for handling Lumber, Refuse, Pulpwood, Logs and all other materials used in the Lumber industry.

Berlin Quality Counts

What We Offer in a "Utility" Resaw

Several years ago we became interested in the future of the Band Saw business and, after having studied the field closely, established a Band Saw Department, and then proceeded to hire the best mechanical talent in the country.

A careful study of conditions and competitive machines brought us to this fact; that the machines offered were not built as good as possible and then sold at a reasonable price—they were built to sell at a certain price.

We know that a policy of that nature could not make good to the fullest extent. So instead of putting on wheels that are cast (rim, hub and spokes) together, we made a radical departure—actually had Steel Rims made elsewhere at a greater cost for the rim alone than we could have cast an entire wheel.

We found that staggered steel spokes in combination with the steel rim, would give a perfectly balanced, very stiff, light running wheel. That was a point scored for us.

Then the straining devices in use at that time were cumbersome, weighted, etc.,—everything but simple. We remedied this by perfecting the simplest straining device on the market. Every part is balanced over knife edges and the force is exerted in straight lines—direct from weight to fulcrum and from fulcrum to upper bearings.

Other points—the superiority of which can be seen by even a novice, are the Variable Speed Device, Safety Saw Guide, Frame Without Overhang, Double Wheel Bearings, Roll Construction—in fact there is no reason why we shouldn't be busy in our Band Saw Department.

The "341", cut of which is shown, carries a 6-inch blade and because of its having the lightest wheels and carrying a short saw, it has the greatest capacity of any machine in its class and in many classes of work, we will put it up against any 8-inch blade.

It has all the good features of our heavy saws combined in a medium priced, medium sized machine. It will do twice the work of a circular resaw and make better lumber. It is the busiest machine in any planing mill or box factory.

But the "341" is just one of our big line. Just write us for details of any kind of a Band Resaw you require.

Ask us to send your operator a copy of our booklet "Fitting and Operating Band Saws." It is a booklet well worth his careful reading.

THE PHILADELPHIA RECORD

What an Insurgent Is
SEE PAGE 3

PHILADELPHIA, SUNDAY MORNING, FEBRUARY 6, 1910

WORLD'S BEST SAWS ARE MADE HERE

Filing Long Saws

In the rapid whirl of events which have world wide interest and significance, it is seldom that the management of a great metropolitan newspaper is profoundly impressed by the methods and achievements of an individual enterprise.

But on February 6th last, the Philadelphia Record—one of the foremost journals of the nation—employed an entire page to illustrate and describe the Disston saw works; to tell the deeply interesting story of its founder and his successors; of their purposes, their ideals and their accomplishments. Here are some of the editorial statements that were made:

"There are various reasons for the growth of this Philadelphia industry from nothing to the greatest of its kind in the world. One is that it has kept ahead of all others in the processes and inventions for sawmaking.

In the beginning, Henry Disston made saws to live, later, when wealth came, he lived to make saws. He studied his art—for it is an art—as a painter studies colors. And he produced a masterpiece. He was the great improver and developer who placed Philadelphia made saws in their present position at the head of the markets of the world for quality, finish and correctness of pattern—a position which his successors so ably maintain."

Disston saws, files and tools give longer and more efficient service than any other implements of similar character manufactured.

Business association with an organization which occupies so high a place in the commercial and manufacturing world; an organization that expends so much time and effort to serve the interests of its patrons, is an asset for every merchant and mill owner who handles or uses saws, files and tools.

For Flooring, Ceiling, Siding, Ship Lap, Double Ceiling, Doors, Sash, Blinds, etc. the Up-to-Date Lumbermen use

The Shimer Cutter Head

Because of the **complete mechanical features** and very **low prices** at which it is placed before the manufacturing trade.

It is kept in first-class working order with less labor and expense than others and offers one of the very best investments, for a little thing, that can be found to-day.

Any size or style, made to fit machine, will be sent on trial 30 days to any responsible lumberman in this or any other country.

Look for the NAME and TRADE MARK "**The Shimer Cutter Head**" stamped on every Head we turn out. A dealer who would sell you an imitation means to deceive you —Send them back and demand the genuine article with our guarantee for your protection.

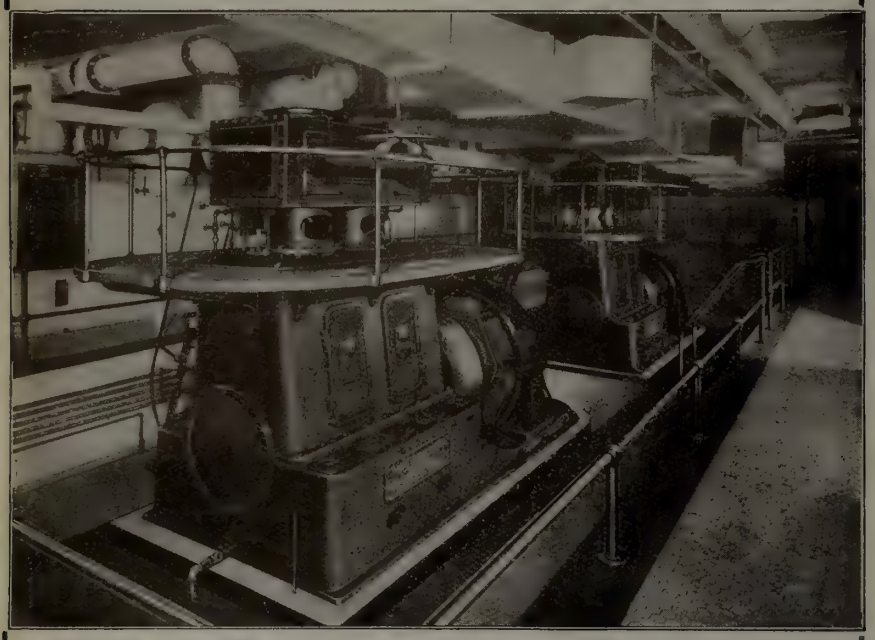
RESULTS ARE WHAT COUNT

A Combined Skidding and Loading Machine that will clear up the largest area at a setting and can be moved and set up in the shortest possible time will get the best results.

The latest Russel machine has some distinct features that save time and trouble, consequently money. Note the new method of suspending skidding sheaves. They are hung from a vertically hinged jib or triangle, the outer end of which is guyed by two lines one on each side, which are power-tightened and can be set while skidding lines are going out. The guy lines lead back so they do not interfere with skidding or loading. The uppermost leg of the jib has a spring connection to the tower, reducing shocks. All



skidding strains are absorbed by the guy lines. The swinging boom is operated by wire ropes passing through sheaves suspended from a steel frame projecting from tower and leading to two drums on loading engine, controlled by one lever. Machine is raised or lowered by hydraulic or patented gear jacks. Built for 2 or 4 lines, with stiff or swinging boom, constructed entirely of steel, except loading boom. Is without question the strongest and fastest machine of the day.

RUSSEL WHEEL & FOUNDRY CO., DETROIT, MICH.

Cost Nothing For Repairs

A customer says :—"We have used one of your vertical high speed engines, English Type forced lubrication since 1907. The engine runs at 425 revolutions per minute almost constantly night and day. It has given us every satisfaction and so far has cost us nothing for repairs."

If You Need a Heavy Band Rip Saw, Look into the Merits of Our No. 109.

In our large descriptive Circular—Sheet No. 1-N

particular attention is called to the massive and substantial construction of our

No. 109 Patent Aut. Band Rip Saw

It is made for **heavy** ripping in bridge, ship and car shops or wherever a heavy rip saw is required.
The general construction of this machine, its

Massive Square Column
Solid Lower Wheel
Patent Sensitive Straining Devise
Strong Feed

make it a superior tool for all lines of heavy work

Two noteworthy features on this machine are our Patent sensitive Straining Device and Solid Lower Wheel, a combination which permits the use of an extremely thin blade at a terrifically high speed without any danger of breaking it.

Feed is the strongest imaginable and consists of two heavy, fluted upper rolls and three lower ones of large diameter, all power driven.

Write for Sheet No. 1-N which illustrates and describes Our No. 109 in full.

No. 109 Patent Aut. Band Rip Saw—Capacity for material 28" wide and 14" thick.

Twelve Good Reasons Why—

Our 1910 Model Band Mill is the most up-to-date, most compact, easiest operated, and fastest cutting mill as yet designed

Because—

The base extends completely around the mill.
The upper wheel is supported above and below mandrel.
Top Wheel has extra wide range of adjustment.
The tensioning device is double knife-edged.
The upper wheel is mechanically tilted from front or rear.
Both guides are saw-centre swing, single or double cutting.
Upper guide is absolutely rigid, non-breakable, water cooled.
Operating mechanism is direct, rapid and power driven.
No belts to gum or slip.
All mechanism is enclosed within column.
Lower Guide is extra high and opens instantaneously.
Every part is accessible.

This Mill is completely described in Bulletin No. 102. Send a post card for it.

FACTORIES
MONTREAL TORONTO

A light man, with this machine, can cut more and better lumber than the strongest setter you ever bad

More lumber, because—It is steam operated. That means it works quicker than any man possibly can.

—It cannot tire—a man using it cuts as much lumber the last hour of the day as during the first hour.

—It will set up to four inches with one throw of the lever, instead of only two inches as all hand machines do.

Better lumber, because—the travel of the piston must be exact, and therefore it is a mechanical impossibility for the machine to make uneven lumber.

Then you are not dependent upon big, strong men only to do your setting. You can employ a setter for his ability regardless of his size.

Shall we send our catalogue?

Dimension Bill Stuff in
Pine, Spruce and Hemlock
A full line of dry lumber in stock for prompt shipment. Let us give you our prices for anything you require in lumber.

Pine Doors
We have long appreciated the fact that price is not the only requisite a dealer must seek in placing his order for doors. Poorly manufactured doors can scarcely be considered a bargain at any price.
Door Making is our Specialty
We have equipped our plant with the best door machinery made, and we are turning out doors that **are right in quality and right in price.**
Our doors need no commendation. They prove themselves. They are business builders for every dealer who handles them.
If you have not received our latest quotations on Doors, Sash, and Interior Trim, write us to put you on our mailing list. It will be mutually advantageous.

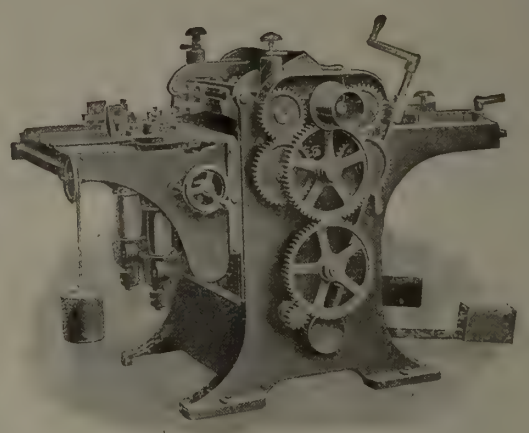
BANNER BRAND CONDENSED MILK

Our Banner and Princess brands of condensed milk, and our two brands of powdered milk are

SPECIALLY SUITABLE FOR LUMBER CAMPS



They can be used for every purpose with as much satisfaction as fresh milk.

We manufacture under favorable conditions and guarantee absolute purity and cleanliness. Our products are the best that skill and science can produce.

Write for full particulars about our various brands.

Prompt shipments and satisfactory prices.

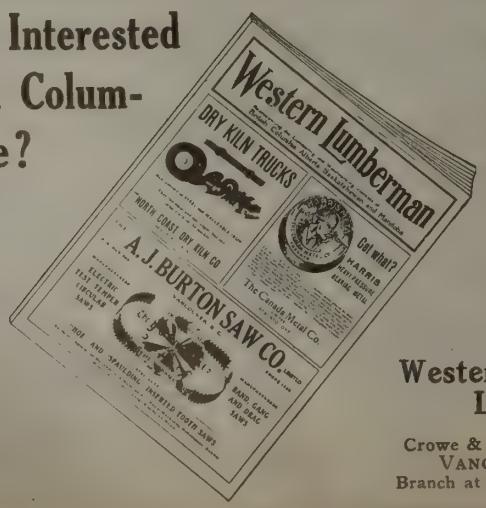
Mouldings

We make the best line of medium size Planer, Matcher and Moulders on the market. When you buy a Cordesman-Rechtin Planer, Matcher and Moulder you are assured on four points:

1st—That you are getting the latest and most improved machine built.

2nd—That you are getting a well designed, well made machine, and one that won't give you any sort of trouble.

3rd—That you are getting a machine that will do good work and lots of it.



4th—That you are getting a machine that is fully guaranteed.

We make four different sizes and styles of these machines. One of these is sure to meet your requirements.

Write for circulars giving full particulars

Simonds Saws

SIMONDS CANADA SAW COMPANY LTD
VANCOUVER B.C. — TRADE MARK Simond Steel REG'D — ST. JOHN. N.B.
UNEQUALED IN QUALITY AND UNIFORMITY
MONTREAL, QUE.

By the building of our new steel mill in Lockport, N. Y., the expression—

Made of Simonds Steel

will have a wider range of influence. More of our Saws can be made with this increased supply of the fundamental material. Quicker deliveries may also result.

Year after year we have been alert to furnish millmen with Saws above the average in quality. Our policy has been conservative, yet every Saw improvement of real merit has been instantly taken up by us and brought before the trade.

We prove first to our own satisfaction that a Saw, Knife or File is right. Then—but not until then—we let the mill have it. Our experience and endorsement are accepted by buyers everywhere as a guarantee of quality.

Our pocket size catalog should be in every mill.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For Manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 30 Toronto, June 1, 1910 No. 11

Record Trade for Eleven Months

The statistics of the lumber trade of Canada for the month of February, 1910, and the eleven months ending with February, show that although a temporary lull in trade occurred during February, the trade for the eleven months had broken all previous records. There is good proof in these figures that the quietness prevailing of late, though somewhat in the nature of caution, is largely a between season matter. It is, in fact, something of the nature of a rest for the consuming public who have been using up great quantities of lumber of late and now have a great deal still on hand to get rid of before coming back for more.

Exports of forest products for the month of February, 1910, amounted in value to $1,509,084, a decrease of about $230,000 as compared with February, 1909, and an increase of $123,000 over February, 1908. The exports of forest products for the eleven months ending February, 1910, amounted in value to $44,490,538, as compared with $37,090,119 in the eleven months ending February, 1909, and $42,391,537 in the period ending February, 1908. The total for the eleven months ending February, 1910, was the greatest yet recorded, and was only approached in 1907, when the total was $43,948,066, and in 1909, when the total was $42,391,537. In all other years the total was lower than $40,000,000. Exports of forest products for the eleven months were exceeded only by two other classes of exports, viz.: agricultural products and animal products.

Exports of wood and manufactures of wood during February, 1910, amounted in value to $1,977,998, against $2,101,517 in February, 1909. For the eleven months ending February, 1910, the exports of wood and manufactures of wood amounted in value to $49,843,271, against $41,639,491 in the same eleven months of 1909, and $46,981,401 in 1908.

Exports of unmanufactured wood for the eleven months ending February, 1910, were valued at $44,412,843, against $37,014,913 in the eleven months ending February, 1909, and $42,315,026 in 1908. Exports of manufactured woods for the same periods were as follows: 1910, $5,430,478; 1909, $4,624,578; 1908, $4,666,375. The export of other unmanufactured and manufacturel wood was therefore increased over each of the two preceding years.

Exports of logs increased during the eleven months by $18,000 over 1909, and $271,000 over 1908. Pine deal exports showed a slight decrease from 1909, of about $45,000, and a decrease from 1908 of about $14,000. The decrease in pine deal exports was largely in the trade with the United Kingdom, the totals of which were as follows: 1910, $1,536,228; 1909, $1,600,737; 1908, $1,561,207. Pine deal exports to the United States during this period were valued as follows: 1910, $82,437; 1909, $59,941; 1908, $83,603. Exports of spruce and other deals show an increase of $1,176,680 compared with 1909, and a decrease of $360,000 as compared with 1908. To the United Kingdom the spruce and other deal exports were as follows: 1910, $5,511,847; 1909, $4,545,106; 1908, $5,865,662. To the United States they were as follows: 1910, $526,987; 1909, $279,463; 1908, $405,291. There has thus been, as compared with 1909, a fair increase in the exports of spruce deals to both the United Kingdom and the United States. As compared with 1908 the exports to the United Kingdom show a slight decrease, whereas to the United States they were considerably increased.

Exports of planks and boards for the eleven months ending February, 1910, amounted in value to $21,674,554, an increase of over $3,000,000 as compared with the same period in the previous year, and $1,300,000 as compared with 1908. Shingle exports to the United States amounted in value to $2,152,878, as compared with $2,328,820 in 1909, a very creditable showing considering the increase of 20 cents a thousand on shingles entering that country.

Wood pulp exports to the United States for the eleven months ending February, 1910, amounted in value to $3,667,279, against $2,690,324 in 1909, and $3,263,735 in 1908. Pulpwood exports to the United States were valued during the same period at $5,635,879 in 1910; $3,930,930 in 1909, and $4,037,076 in 1908. This is a very material increase, which, however, may be expected to be reversed when the figures for the present year are published, as a result of the prohibition of the export of pulpwood cut from Crown lands in the Province of Quebec.

Imports of wood and manufactures of wood (furniture included) during the eleven months ending February, 1910, amounted in value to $10,000,776, against $7,681,365 in the same period of 1909, and $12,304,553 in 1908.

Still More Tariff Disturbances

Although the Tariff Act of the United States is still some two or three months short of a year old, the Republican party has been so alarmed by the opposition which it has developed, particularly in the States along the Canadian border, that it has decided apparently to open the whole question once again, and it seems probable that all the trade disturbances which resulted during the year previous to the passage of the Tariff Act of August 5th, 1909, will be repeated. Possibly this is a pessimistic view of the situation, and the move of the Republican party in having a tariff board appointed may be more of a political nature than of an economic one. It remains a fact, however, that the appointment of the board has been decided upon and a sum of $250,000 appropriated to meet its expenses in inquiring into the cost of production of all kinds of manufactures in the United States and abroad. Beyond question, the serious condition of the paper industry in the United States, depending so largely as it does upon Canadian pulpwood for its raw material, has been one of the most important factors in bringing about the dissatisfaction, so generally felt with the new tariff in the northern States. The imposition of a duty of $3.75 a ton on print paper entering the United States, while intended as a measure of protection in favor of United States mills, turns out to have been futile, because the United States forests cannot supply those mills with raw material. There was some sort of an idea among United States paper users that this duty and an extra duty of $2 per ton against countries which prohibited or taxed the export of pulpwood or paper, would bring Canada to her knees with an offer of free export. This idea has not worked out, but Canadians have taken advantage of their position to preserve their pulpwood re-

sources for Canadian paper mills and the paper manufacturers of the northern States are up in arms against the tariff. They have secured widespread support and the Government has, as a result, been defeated in some important elections which have recently occurred in districts closely affected by the paper situation.

That Canadian paper manufacturers have more than held their own in spite of the high duty is shown by statistics from Washington. There has been a large increase in imports of printing paper into the United States from Canada since the passage of the Payne-Aldrich Tariff Act. During March, 1910, the imports of Canadian printing paper amounted to 11,551,041 pounds, whereas in March, 1909, the total was only 3,431,583 pounds. For nine months ending March 31st, the totals were: 1910, 57,278,541 pounds; 1909, 26,272,038 pounds. At the same time the imports from Germany have shown a material decrease and those from other countries a slight increase. The figures go to show very clearly that Canada is in an ideal position to supply the United States with its printing paper, and it is a matter for congratulation that Canadian labor will be employed in future in the manufacture of Canadian pulpwood into the finished product.

This situation was surely foreseen by the framers of the Payne-Aldrich Tariff Act, and points plainly to the conclusion that the Act was intended rather as a big stick to be wielded in international negotiations, than as a workable measure of protection. There are many other less serious, but considerably disconcerting, features of the tariff which have made it something of a boomerang, and one is not surprised that even at this early date the United States Government should attempt to save its face by appointing a tariff board to enquire whether its latest tariff is not something of a failure.

The Freight Rate Judgment—Lumbermen Will Fight

It is understood that the Canadian Lumbermen's Association will not submit to the decision of the Railway Commission in the lumber freight case. The reasons for the judgment are being considered by lumbermen and counsel. So far, no official statement is obtainable as to what course may be taken. Lumber shippers and all others even indirectly interested in the sale of lumber give private views to the effect that the judgment is most unsatisfactory. Unless the appeal be based on some legal point, recourse to the Supreme Court appears to be cut off. There is, however, the means of seeking an order in council, which can be resorted to in extreme circumstances.

The judgment of the Board of Railway Commissioners, which is signed by Commissioner Scott, commences with a recital of the events which occurred during the various hearings of the appeal of the lumbermen, paying attention particularly to the opportunity which was given to the railway companies to justify the reasonableness of their new rates.

Continuing, the judgment says in part:

"There was an admitted necessity for a revision of the tariffs as they existed prior to May 1st, 1908, the rates in many instances were much lower than the average rates for other commodities for similar distances, and the total increase of approximately $40,000 per annum on domestic and export shipments over the two roads amounts to but 3.14 per cent. of the gross revenue from lumber movements earned by the companies during the first year of the new tariffs.

"The companies, in justification of their new lumber tariffs: (a) compared them with the tariffs of lumber carriers in the United States; (b) compared their rates on lumber with the rates on other building material, and the percentage of freight rate to the value, of the one to that of the other; (c) established the very great increase in the value of lumber, and the comparatively small relative increase in the rates thereon during the ten years prior to the effective date of the new tariff; and (d) showed the increase in the cost of the maintenance and operation of railways during the same period of time, and especially that feature of it which is due to the increase in the price of ties and of the different kinds of lumber required in building cars.

"I shall not attempt a review of all the evidence submitted; but I may point out a few features which impressed me:

"(A) The railways showed over 20 rates on lumber in Kentucky and Tennessee, for distances varying from 28 to 273 miles, and compared them with Canadian lumber rates for similar distances. In no case, did a Canadian rate exceed the American rate; in many instances, the Canadian rates were lower. Of course, the cost of the maintenance and operation of railways and the volume of traffic moved in those States, as compared with similar items in Canada, would have to be gone into before any very reliable conclusion could be drawn from such a comparison; but I presume it is some evidence of the reasonableness of the Canadian rates.

"(B) In their statements showing a comparison of values and rates on lumber and other building material, we find the following: The value of a carload containing 20 tons of hemlock lumber at Owen Sound, at $14 per thousand, is $186.60; the cost of hauling it to Toronto is $32, which makes the freight charges 17 per cent. of the value of the commodity. The value of a car of 20 tons of coursing stone or of dimension stone at Owen Sound is $100, and the freight charges to Toronto on the coursing is $28 and on the dimension $40—showing the freight to be 28 per cent. of the value in the case of the coursing and 40 per cent. in the case of the dimension stone. Similar comparisons of the values of commodities from Penetang to Montreal show that the transportation charges bear the following percentages to the values of 20-ton carloads: coursing stone, 54 per cent.; dimension stone, 72 per cent.; hemlock, 26¾ per cent.; spruce, 25 per cent., and white pine, 14 per cent. Cement at Owen Sound is worth $148.60 for a 20-ton carload, hemlock $186.60, spruce $200, and white pine $355.60. In each case, the freight charges to Toronto are $32. The percentage of this charge to the value of the commodity is as follows: Cement, 21½ per cent.; hemlock, 17 per cent.; spruce, 16 per cent., and white pine 9 per cent. Similar comparisons of building brick and lime with lumber show practically similar results.

"(C) In my opinion, the strongest evidence submitted by the companies in justification of the increased rates on lumber was the very large increase in the value of lumber during the past ten years. The value of the commodity hauled is an element that may properly be considered in rate-making. In general, the greater the value of the article, the greater the rate may be. There are, of course, many other elements to be considered in deciding on the reasonableness of a rate, which may in some cases outweigh the element of increased value of the commodity.

"The companies put in very voluminous statements showing the increase in the cost of the maintenance and operation of their lines for the ten years following 1897. They were unable to give the increased carrying capacity of their trains during the same period, which the lumbermen's counsel asked for; and the Statistical Branch of the Railways and Canals Department is unable to supply me with the information. The carrying capacity of trains must undoubtedly have increased considerably in the past ten years; and the volume of traffic moved by the railway is, of course, enormously greater than ten years ago. Nevertheless, taking the case of the rates on lumber alone, where the increase has been so small, it is fair to attach some importance to the large increase in the cost of maintaining and operating railways.

"The lumbermen were not prepared to discuss the figures submitted by the companies, as they did not know beforehand what evidence would be submitted. I, however, believe the statements put in by the companies to be true in fact; and, therefore, even if the lumbermen had had previous notice of the character of the evidence to be submitted, I do not think it would have made any material difference.

"Very elaborate and carefully prepared statements were submitted by the lumbermen to show that the lumber rate per ton per mile on the total of freight movements in Canada. Taking the general average rate per ton per mile as a basis of comparison, we find there are a number of individual rates in the new tariffs which appear without explanation, to be excessive; but, as I understand it, this enquiry is into the reasonableness of the new tariffs as a whole, and not into the reasonableness or unreasonableness of each individual rate taken separately.

"Speaking generally, then, of the new tariffs as a whole, I am of the opinion that the railway companies have succeeded in justifying the increases they show in rates on lumber for domestic use; and that, in so

far as the domestic rates are concerned, the tariffs should remain effective and the application be dismissed.

"Unjust discriminations or undue or unreasonable preference may exist in these new tariffs; and the decision in this matter will not preclude anyone, who thinks himself aggrieved, from laying a complaint against any individual rate in the tariffs, which complaint will be carefully considered by the Board. The attack in this case was made on the tariffs as a whole; and, in my opinion, that attack, in so far as it relates to the domestic rates, has failed.

"The justification of the domestic rates carries with it, to some extent, the justification of an increase in the rates for export; but it does not justify a greater percentage of increase of the new export rates over the old than has been made in the domestic rates from the same points, nor does it justify the action of the companies in abolishing the difference which existed between the domestic rates to Montreal and the export rates to that point. One reason for doing away with the lower rate to Montreal for export given by the railway companies, is the fact that they must now pay the harbor commissioners a rate of $2.50 per car for switching, which they had not to pay when they performed that service themselves. This is quite true; but that service must have cost them something. I do not think they told us what it cost them; but it is not unfair to assume that it must have been somewhat near the amount charged for the service by the harbor commissioners. The statements put in in September show an average increase in the rates per car for export on the Grand Trunk of $3.98 and on the C.P.R. of $2.86. In my opinion this has not been justified. It is a much greater increase than in the case of the domestic rates. Furthermore, the fact that the companies maintained for many years export rates to Montreal which were considerably lower than the domestic rates to that port, creates a presumption that such a condition was reasonable, which has not been rebutted by the companies.

"Export rates lower than domestic rates are maintained to other Atlantic ports, and I see no reason why Montreal should not receive a similar advantage.

"In my opinion, the companies should re-establish export rates to Montreal which will, on the whole, be lower than the domestic rates; and I think they should be ordered to file tariffs for that purpose within a reasonable time."

Valuable Report Upon Quebec's Timber and Forestry

One of the most valuable and interesting governmental reports on subjects of forestry and lumbering operations which has ever been published in Canada is contributed by Mr. G. B. Piche, to the annual report of the Minister of Lands and Forests of Quebec, which has just been issued. This is the first annual report of the Forestry Service of the Province of Quebec. Under the direction of Mr. Piche a number of agents and forestry students supervised the lumbering operations of a portion of four Quebec counties, viz.: Montcalm, Jolliette, Berthier and Maskinonge. The information which they gathered and the suggestions which Mr. Piche bases upon this information are of the utmost importance. These counties contain a forestry region at the gates of Montreal; that is to say, close to an excellent market, and they have been for the most part ruined by fire and useless deforestation. As Mr. Piche points out, it is high time to adopt energetic measures to put an end to so pitiful a state of affairs. What he says about these counties will apply with almost equal force to many other districts in various parts of Canada. The governments of to-day will have no available excuse to offer to the people of Canada if they fail to adopt measures which will be genuinely effective in preserving the forest wealth which remains. Publicity has gone far of late to assist in the preservation of the forests, but the people of Canada to-day, and those who are to come after us, have lost vast quantities of forest wealth which can never be replaced. In the face of the increasing scarcity of timber in all parts of the world, there is no more manifest duty for the governments to perform than to see that the resources which remain shall be saved.

The saving of the forest wealth of the country depends mainly upon two things; economic methods of lumbering and efficient fire protection. As to protection from fire, much has been done and greater efforts are being made each year. Not, however, until the fire loss has been reduced to a minimum will the people of Canada feel that the governments are doing their duty. Expenditure upon fire prevention in the past has been ridiculously inadequate. The matter is one which has not seemed to touch the public purse quite so closely as many others. As public sentiment was slow to appreciate the importance of the subject, a small appropriation has generally been considered sufficient. It is encouraging to note that after a long course of education, public opinion is awakening to the situation and governments in general are showing an inclination to devote larger sums of money to this purpose. Many times the present sums will have to be voted and wisely expended, however, before we can enjoy the satisfaction of feeling that we are doing everything that is possible.

Another subject which Mr. Piche devotes considerable attention to, is the necessity for having a proper working plan in connection with timber cutting operations. This matter has not been given nearly as much attention as it deserves. It is no exaggeration to say that in scarcely any section of the whole of Canada, has the timber which has been cut in the past been secured at a possible minimum of cost. The methods in use to-day in many parts of the country are those which prevailed when the lumber industry was in its infancy. This does not apply of course to the sawing of lumber, in which great advances have been made, but it does apply forcibly to the woods work. In eastern Canada if statistics were available, it could probably be easily proved that the lumber which has been cut in the past and sold at what afforded an actual profit for the operator, has involved a loss to the country in wasted timber not far short of the profits by the lumbermen. In fact, it is questionable whether the cost to the country of the disappearance of the white pine can ever be adequately estimated. With scientific methods of lumbering, the white pine which has disappeared in many sections of the country might now have been providing an additional supply for future generations, and the less valuable woods, by means of economic lumbering, would serve to meet the rapidly increasing demand which to-day is causing so much anxiety and fear of a lumber famine.

Mr. Piche is therefore deserving of sincere thanks from the people of Quebec for making this subject the foremost consideration in his first forestry report. By his investigations he has found that the companies which are cutting lumber in the four counties under discussion have been working entirely in the dark, knowing little or nothing of the resources upon which they may depend, and running a serious risk of depreciating these resources to such an extent as to ruin their business. He makes a strong argument in favor of having skilled foresters draw up a working plan for all lumbering operations. By such means only, will it be possible to avoid in the future, what has so often occurred in the past, the dismantling of many a fine mill for the simple reason that the timber in its region has been wastefully cut and can no longer supply material for operations. Foresters and lumbermen have to-day learned that if they had handled their cutting operations in a scientific manner in the past, limits which have now been abandoned would in many cases be providing a perpetual supply of good marketable timber. There is no room for doubt that lumbering operations to-day demand the services of skilled foresters who can advise as to what should be cut and what should be left to increase in value. Without such advice the timber owner will lose money and the country will be deprived of its resources. Through the employment of such men alone, can the country look forward to the solution of those problems which have been like nightmares to lumbermen in the past. Above everything else, so far as the personal interests of the lumbermen are concerned, it will be a natural outcome, that the vexed question of the clashing interests of lumbermen and settlers will be solved. With the definite advice of a trained forester as to which lands are best suited for lumbering and which for settlement, no government will be able to distribute timber berths indiscriminately to its friends under the guise of settlers' land grants. This and many others of the evils which have been connected with the lumber industry in the past are dealt with by Mr. Piche, and his report gives good promise of inaugurating a period of indispensable reform in Quebec. The example of such reforms will be pregnant with importance for all other parts of Canada.

Stratford as a Lumber Consuming Centre

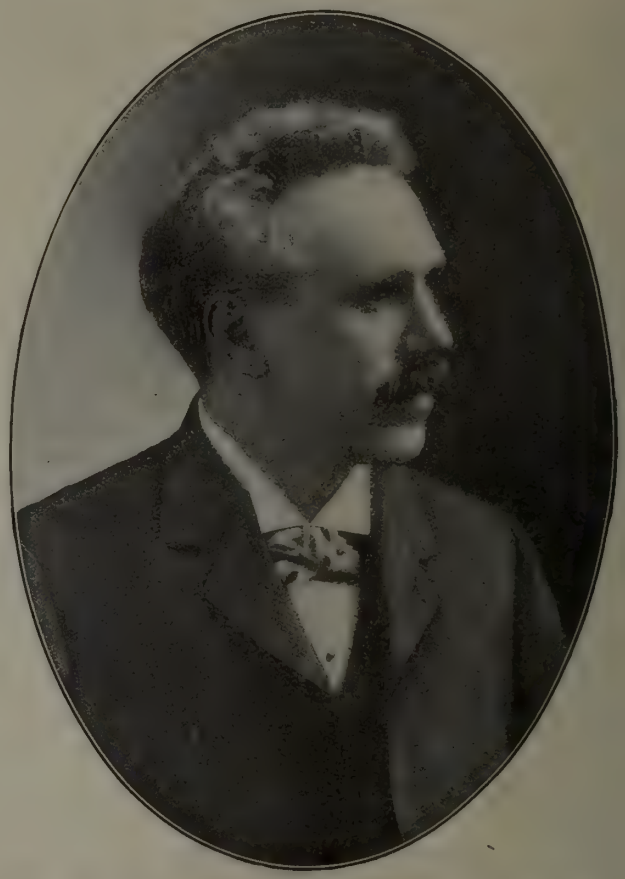
Three Furniture Factories Alone Used Four Million Feet in 1909—Favorable Location Assists Companies to Secure Trade—Wholesale Dealers Prospering

It may prove somewhat of a surprise to readers of the "Canada Lumberman" to learn that as a lumber consuming centre the city of Stratford, Ont., stands in the front rank both as to the volume of business done and the amount of lumber actually consumed. In this city there are located several large furniture factories, which employ hundreds of men the year round, and which consume lumber totalling to millions of feet annually. In 1909, three of the most important factories there, the Geo. McLagan Furniture Company, the Globe-Wernicke Company and the Stratford Chair Company, consumed 4,000,000 feet, the great majority of which was hardwood, which was purchased in the United States. Over 1,400,000 feet of oak alone were used in the manufacture of different kinds of furniture, while of mahogany, maple, cherry and kindred hardwoods, about an equal proportion of each was consumed.

One of the chief reasons for the phenomenal growth of the lumber consuming business is found in the favorable local conditions. A furniture dealer ordering from Stratford enjoys the privilege of a lower freight rate on his goods proportionately than from many other centres. This has been accomplished by an understanding between the three large firms, which allow a mixed carload of furniture to be shipped from their different warehouses in combination. Furniture dealers have not been slow to take advantage of this unique system. Thus, if a dealer needs a carload of different classes of furniture, he is not obliged to go to different places and pay increased freight rates, but can have it all shipped from one point. The reduction in the freight rate is considerable and has led to a large and increasing amount of trade being directed towards Stratford which otherwise might have been diverted into other channels.

In Stratford also are located several large and flourishing planing mills which supply the local demand. In three of these mills in 1909 over 3,000,000 feet of lumber were consumed, of which 2,500,000 feet were pine, the remainder being hemlock. These mills report a very busy season and claim that 1910 will, according to present indications, almost double 1909 in volume of business.

In order to give the readers a first hand knowledge of the extent of the trade in this connection, carried on in Stratford, we publish herewith a brief description of the various firms interested in the lumber industry.



The Geo. McLagan Furniture Company

The story of the growth of the George McLagan Furniture Company in Stratford is a remarkable one. Mr. Geo. McLagan, the head of the concern, is an old Huron county boy, who went to Stratford from Clinton as a young man and made his first start as a manufacturer of furniture in 1886.

On March 1st, 1900, Mr. McLagan's first plant, a frame structure on the present site of Oman & Easson's mills, was consumed by fire. This was replaced by the new and now widely known Geo. McLagan Furniture Company, whose products are sold from ocean to ocean and have an enviable reputation. Over 200 men find employment with this firm.

Mr. McLagan himself is recognized as a business man of the highest calibre and though his business occupies a large amount of his time, no citizen in Stratford is more zealous in the city's welfare. He is chairman of the Park Commission, is an active supporter of Baptist Church work, and takes a keen interest in Y.M.C.A. work.

At the present time the company are building a large addition, 160

Geo. McLagan, Pres. and Man-Director. Geo. McLagan Furniture Co., Limited, Stratford

H. L. Merritt of Merritt & Co. Stratford

x 60 feet, four storeys high, of solid brick, which will increase the floor space of the factory by two-fifths. They will also install at the same time a modern veneer plant.

The firm are among the largest consumers of lumber in Stratford. During the year 1909 over two and a half million feet of lumber were made up by them into furniture. Three-fourths of this was hardwood and was purchased in the United States market. This year the output promises to be much greater than that of the previous year.

The Globe-Wernicke Company

One of the big, solid and progressive industries of Stratford is at the Globe-Wernicke factory, where the well known branch of office furniture of the same name are manufactured. The present large factory building was begun in 1902, and now employs 120 hands. The output of this factory finds a market all over Canada, the company having agencies in all the principal cities and towns of the Dominion. At the opening of the Globe-Wernicke works in Stratford, Mr. J. J. Mason came from Montreal as manager and principal owner. He has become one of Stratford's foremost citizens and leaders in every movement for the advancement of the city's interests. He was born in England, but has spent the greater part of his life in Canada. The company is also a large lumber consuming one, over 700,000 feet annually being used in its factory.

Stratford Chair Company

Another large and growing industry located in Stratford is the Stratford Chair Company, of which Mr. Geo. McLagan, of the Geo. McLagan Furniture Company, is general manager, and W. J. Anderson secretary-treasurer. A few months ago the size and capacity of this factory was doubled by the amalgamation with the Central Furniture Company, and now employs 135 hands. As a lumber consuming plant it stands in the front rank. Last year over 1,000,000 feet was used, of which the majority was elm, maple and plain oak. As with the majority, they buy their hardwood in the United States. Quite recently this firm installed several new and up-to-date machines and are fully equipped to turn out the large orders that are pouring in from coast to coast.

Neilson Mills and Lumber Company

Occupying a creditable position in the industrial activities of Stratford is the Neilson Planing Mill. The proprietor, Mr. C. Neilson, is a native of Mornington township. From 1895 to 1902 Mr. Neilson was engaged in contracting work at the Soo, and later ran a sawmill at Listowel. Moving to Stratford in August, 1908, he bought the defunct Stratford Mill & Lumber Company's plant, which he has turned into a flourishing industry. The machinery of the plant has been overhauled and several new time-saving machines installed.

Although last year was practically the first full year Mr. Neilson had in Stratford, over 500,000 feet of pine and hemlock was handled. The outlook for the firm in 1910 is very bright, as already they have handled as much lumber as all last year's output, which they bid fair to double.

Ruston & Company

One of the most flourishing mills of Stratford is that of Ruston & Company, who enjoy a large local trade, as well as shipping some of their product to other points in the county. The manager, Mr. T. M. Ruston, is a native of Stratford, and has been in business there for over fourteen years. Last year 1,500,000 feet of soft pine were consumed by the mill alone, which goes to show the volume of business that passed through the hands of the company.

Pfeffer & Company

Although only located in Stratford for three years, the firm of Pfeffer & Company has succeeded in building up a large local trade, which is yearly increasing in volume. A planing mill is run in connection with the lumber yard, and last year over 1,000,000 feet of lumber, principally hemlock and pine, was handled. Mr. C. E. Pfeffer, the principal member of the firm, is a native of Wilmot township, County of Waterloo, and has spent over eighteen years in the lumber business.

Merritt & Company

The firm of Merritt & Company is pushing rapidly ahead to a foremost place in the city's industries. Although located in Stratford only four years, the business was formerly carried on in Blenheim, where it was established in 1897. This firm specialize in slack barrel cooperage stock, of which they turn out a large quantity, their output finding a market from coast to coast as well as many parts of England, to the markets of which they ship in large quantities. Over 2,000,000 feet of different kinds of timber was used by this firm during the past year, the greater part of which was soft elm. The prospects for this year are even brighter. Quite recently they bought out the Chatham Bent Goods Company, who have been in business there for some years, and will operate there under the firm name of Merritt & Company.

Wholesale Lumber Firms

Among those interested in the lumber industry in Stratford are two active wholesale firms, both of whom do a considerable business throughout western Ontario.

The Manufacturers' Lumber Company is a comparatively new organization, having been in existence about four or five years. The manager is Mr. J. E. McFadyen.

Mr. William Gordon is a wholesale operator who has been interested in lumber for many years. He is a very prominent citizen of Stratford and has several times been mayor of the city. During his first administration he was successful in negotiating for a very large addition to the G.T.R. workshops, which are an important feature of the industrial life of Stratford, employing a large number of men.

Busy Firms in Western Ontario

Active Developments in Trade of Wingham, Wiarton, Owen Sound, Palmerston, etc. — Extensive Additions to Plants

F. Buchanan, Wingham, Ont.

On May 20th the town of Wingham, Ont., passed a by-law granting a bonus of $1,800, a fixed assessment of $2,000, and a 21 years' lease of a large portion of land, to the firm of C. Lloyd & Son, wholesale door manufacturers, of that town. It had been the intention of the firm to remove their plant to another town where better inducements had been offered them, but Wingham has been able to retain this industry, which will immediately enlarge to five times its present capacity. This is an old established firm, having been first started in Wingham in 1888 by the late C. Lloyd. In 1903 it was reorganized, when Mr. A. E. Lloyd, son of the late proprietor, joined a partnership with Mr. F. Buchanan, for many years a well known resident of Toronto, and the business has been carried on successfully ever since. Mr. Buchanan has been business manager of the company for many years.

The new addition which the firm will erect, will be 150 x 50 feet, of reinforced concrete and brick and there will be installed the very latest machinery pertaining to this industry. The firm of C. Lloyd & Sons have in the past been in the lead in the door making industry, and with their enlarged and improved facilities will be in a position to cater to the trade very thoroughly.

Keenan Bros., of Owen Sound, Ont., have purchased the steam tug "Winana," which they are having rebuilt. It will be put in commission on the Georgian Bay for log-towing. The steamer has been renamed the "Keenan," and will be operated by the Keenan Towing Company.

One of the progressive lumbermen of Wellington county is M. Wooldridge, of Palmerston, Ont., who conducts a planing and sawmill at this place. Mr. Wooldridge has been in business in this town for thirty years, and every year has seen an increase in the business and an extension to his plant. During the past year an up-to-date veneer plant and a cheese box plant were added to meet the requirements of the business. Mr. Wooldridge also has a wholesale lumber yard at this point and handles builders' supplies of all kinds.

Mr. Paul Leinberger, formerly manager of the Interior Wood Factory, of Elmira, Ont., has purchased the planing mill of Spiesz Bros., Hanover, and will conduct the business on a much larger scale than heretofore.

G. S. Sinclair, & Sons, of Wiarton, Ont., manufacturers of lumbermen's machinery, whose factory was, a short while ago, badly damaged by fire, has added a splendid new addition to the former building, and intend enlarging their present plant. It is their intention when this is done to go in for the manufacture of lathers, bolters, trimmers, and shingle packers, as well as their line of patent couplers, which are so well known throughout Ontario.

Geddes, Tyson Lumber Company is the name of a new lumber firm, which has started operations in Owen Sound, Ont. They have yards at this point, and will deal in lumber of all kinds. Messrs. Geddes & Tyson were formerly of Wiarton, Ont.

Serious bush fires in Saskatchewan, during the last week of May, destroyed over 150 square miles of timber south of Mistatim, Sask. The mills of the Cowan Construction Company had a narrow escape from destruction, being saved only by a change in the direction of the wind. A considerable quantity of ties and lumber were destroyed along the line of the C.N.R. The limits destroyed are Government property under lease to Mackenzie & Mann.

Hemlock Prices Have Advanced

Producers in Georgian Bay District Ask Higher Prices and Secure Them with Little Difficulty—The New Schedule

An informal meeting of about 20 of the larger manufacturers of hemlock in the Georgian Bay district was held recently to discuss market conditions. The low prices which have been received for the last year or more were considered and the general consensus of opinion was that, on account of increased cost of production, the old prices could not be continued much longer without forcing the manufacturers out of business. The manufacturers discussed the situation in detail and finally a basis of prices was drawn up, which will be followed for the present. No hard and fast agreement was made to adopt these prices, but those present realized that these prices were the lowest that could be accepted without losing money. The schedule as drawn up is as follows:

No. 1 Hemlock

1 x 4 and 5-inch x 9 to 16 feet	$13.00
1 x 6-inch, 9 to 16 feet	15.00
1 x 8-inch, 9 to 16 feet	15.50
1 x 10-inch, 9 to 16 feet	16.00
1 x 12-inch, 9 to 16 feet	16.00
1 x 7, 9 and 11-inch, 9 to 16 feet	15.00
1 x 4-inch to 9-inch, including 6 and 8-inch	14.50
2 x 4-inch to 12-inch x 9, 10 and 16 feet, exclusive of 6-inch x 9 and 10 feet	16.00
2 x 4-inch to 12-inch, x 12 and 14 feet	15.00
2 x 4-inch to 12-inch x 18 feet	18.00
2 x 4-inch to 12-inch x 20 feet	20.00
2 x 4-inch x 12-inch x 22 feet	22.00
2 x 6-inch x 9 and 10 feet	14.50

No. 2 Hemlock

4/4 x 6-inch, 16 feet	10.00
2 x 4 to 12-inch x 6 to 16 feet, assorted widths	11.00
2 x 6 to 12-inch x 6 to 16 feet, unassorted	10.00

Important Announcements Regarding Conservation

Several important announcements by public men in a position to speak with authority in respect to the conservation of natural resources were conveyed to the public meeting in Convocation Hall of the University of Toronto, May 18th, held under the auspices of the Ontario Forest, Fish and Game Protective Association. The chairman, Hon. Frank Cochrane, Ontario Minister of Lands, Forests and Mines, stated that it was the intention of the province to blaze the trail in provincial co-operation. "We have been taking stock," he said, "with a view to action. We are realizing that a strong and helpful policy may be evolved to grapple with our share of the conservation problem in conjunction with the promotion of public health. We propose, in the near future, to do something to dispel the erroneous theory that God only made great tracts of our wild, unopened country to hold the balance of it together."

Mr. Byron E. Walker urged upon the Minister a proposal that the Government should turn over to the University of Toronto a large area of land in order that its forestry department may try the practical experiment of turning it into a dividend-producing perennial forest, the results to lighten the cost of education.

"It will not be hard to persuade the Government to act upon that suggestion," commented Hon. Mr. Cochrane promptly. "The subject is before them, and a practical and successful demonstration has been made of its possibilities by the forestry students of the Ontario Agricultural College."

Hon. Clifford Sifton, chairman of the Conservation Commission, in the course of an interesting address said: "We have counselled the Canadian Government that the most prolific cause of the appalling destruction of forests is fire, and recommended an amendment to the Railway Act requiring every railway company to maintain an efficient fire-fighting force along every mile of its lines, and placing the companies under a very heavy penalty for fires started by their locomotives. It is a pretty radical measure, but I am pleased to be able to tell you it has met with favor from the Government, and we may expect the legislation at the next session of Parliament."

Hon. Mr. Sifton had another Ottawa announcement of importance. The Commission had urged upon the Dominion Government the establishment of an immense forest reserve on the eastern slope of the Rocky Mountains. "This," he declared, "is to be carried out almost immediately." The reserve would be 400 miles in length, and from 50 to 150 miles wide. "It will be the greatest forest and game preserve in the world," stated Mr. Sifton, "and will be national property for all time to come." He suggested that Ontario take some such action relative to the district between Sudbury and Port Arthur.

"We have now two such reserves," commented Hon. Mr. Cochrane, "and I am pleased to assure Mr. Sifton that before another year goes round the Provincial Government will probably adopt a policy under which each reserve as it is set apart will become likewise a fish and game preserve."

"We are standing on the threshold of a new national era," was Mr. Sifton's prompt declaration. "We are getting rid of the old shibboleths. Net methods must prevail. The great questions which divide political parties are either dead or solved. We are aiming at a comprehensive and systematic plan of laws and regulations to be so framed and carried out that the permanent assets of the people will be administered in such a way as to prevent monopolistic control, and inure to the public benefit for all time to come."

University Foresters' Summer Plans

Mr. A. H. D. Ross, of the faculty of forestry, University of Toronto, has gone to British Columbia, where he will be engaged in forestry work during the summer. He will take four of the university students of forestry with him.

The Canadian Conservation Commission will be represented at the International Association of Forest Experiment Stations at Brussels, Belgium, by Dr. B. E. Fernow, head of the Department of Forestry of the University of Toronto. Dr. Fernow will also represent the commission at the International Congress of Geology to be held shortly at Stockholm, Sweden.

Dr. B. E. Fernow, Dean of the Faculty of Forestry of the University of Toronto; Mr. A. H. D. Ross and about 20 students who had been in camp at Nine Mile Lake, Muskoka, have returned to Toronto. The work was prosecuted vigorously and enthusiastically by the students and the course was completed a few days earlier than was anticipated. This was the more satisfactory as a number of the students have been engaged for the summer by the railways, the governments or private parties, and are anxious to get away to their work. Dr. Fernow, Mr. J. H. White, Dr. C. D. Howe, and Mr. T. W. Dwight, one of the graduates of the Department of Forestry, Mr. A. Joly de Lotbiniere, a senior student, and Mr. W. Kynoch have gone to Nova Scotia to complete the forestry survey which was commenced last summer. Dr. Fernow will return shortly and then leave for a trip to Europe.

United States Lumber Production in 1909

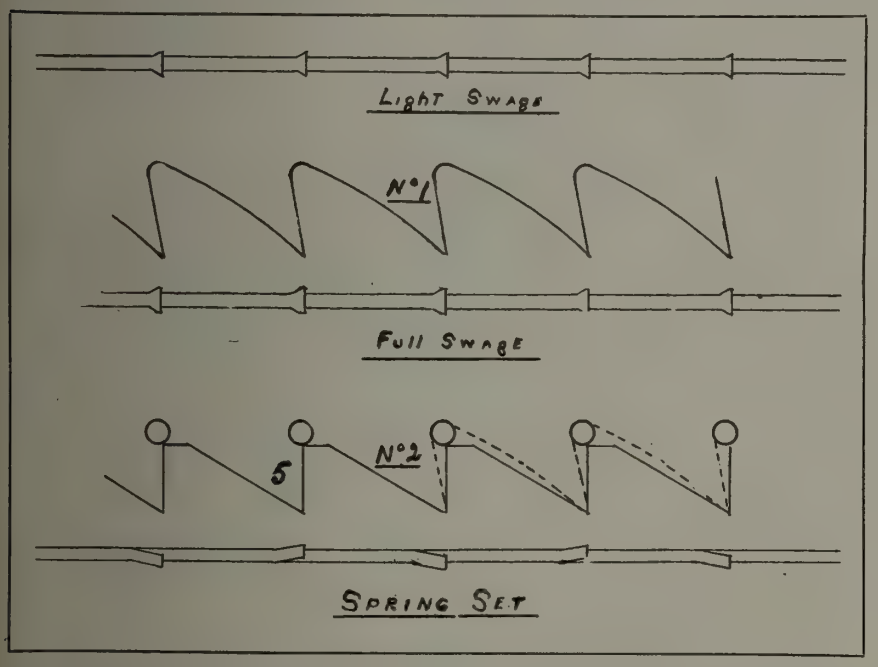
The annual statistics of lumber production and stocks in the United States for 1909, compilated by the "American Lumberman," include a report for 7,459 mills, as against 5,547 a year ago, an increase of 1,942. or 34.46 per cent. In addition, 677 mills were reported idle during the year, and 675 cut out, burned, dismantled, etc., so that 8,811 mills are represented.

The aggregate cut of soft woods was 23,170,482,000 feet, against 15,751,834,000 feet for 1908, a gain of 47 per cent.; the stocks at the end of the year were 6,794,050,000 feet, as against 5,389,475,000 feet, a gain of 26.05 per cent. The hardwood cut was 4,649,616,000 feet, against 3,619,870,000 feet, a gain of 28.48 per cent., while hardwood stocks were 1,590,431,000 feet, against 1,415,125,000 feet, a gain of 12.38 per cent.

Considering both hard and soft woods together, the aggregate gain in production was 43.62 per cent., and in stock 23.21 per cent. Relatively the gain in production is greater than the increase in number of mills, while the gain in stocks is less. The average mill, therefore, cut more lumber but had smaller stock on hand at the end of the year.

The average mill cut 3,729,804 feet during the year, against 3,492,100 feet for 1908, shows a gain of 6.77 per cent., and mill stocks at the end of the year averaged 1,124,070 feet, against 1,226,710 feet at the end of 1908, or 91.63 per cent. of the product.

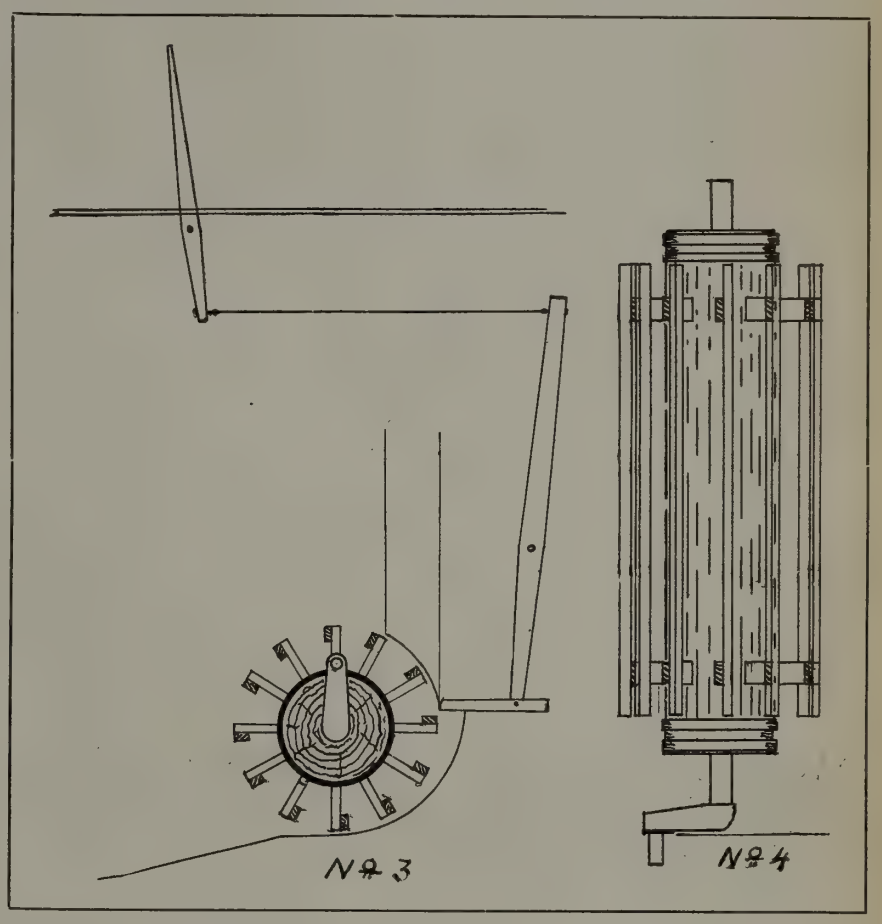
Much Lumber is Wasted in Production of Sawdust



Editor "Canada Lumberman"—I visited a mill the other day in which they were using a circular saw, 54-inch diameter, which is not unusual in this country, for manufacturing hemlock and spruce lumber. In conversation with the setter on the carriage, who was at liberty for a few minutes while the saw was being sharpened, I made the remark to him that the saw appeared thick. He said it was 8 gauge, and that during the winter he was employed in a mill using a band saw 14 gauge, and band resaw 18 gauge. In the latter mill he could make nine good boards out of a log, which in this mill he could not get eight out of. He further remarked that in logs from 12 inches to 20 inches there was lumber enough turned into sawdust to pay one-half the men employed, when they were cutting one inch lumber. This man knew well what he was talking about, for if there is one man more than another about a mill who should know what can be made out of a log it is the setter. Being on the carriage for years he becomes so expert that he can tell exactly where to place the standards to receive a log coming on, and can tell exactly what can be made out of a log before it is placed on the carriage, under ordinary circumstances. This man remarked, "I would like to receive 10 per cent. of what could be saved with the other or thinner saws for my pay."

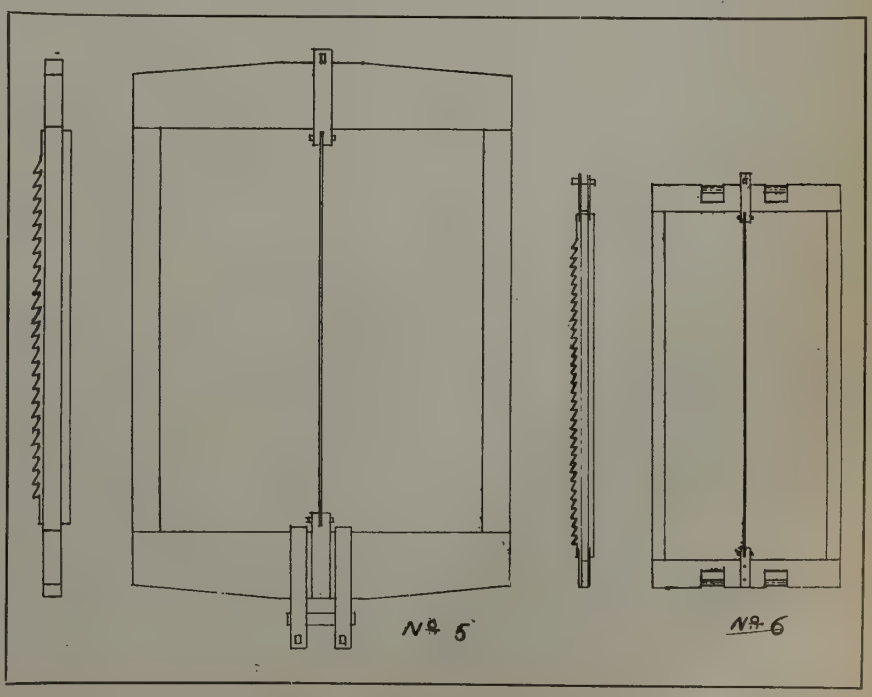
In these letters, Mr. Editor, I wish to state nothing but facts as they are brought to my notice at the mills.—I. N. Kendall.

Straight Line Saws—Methods of Care



Principles of the Pit Saw Followed in Filing — Difficulties met with by Early French Engineers in Canada—By I. N. Kendall

In this article I shall endeavor to show how all the straight line saws followed out the principles of the pit saw, the only difference being that the latter ones were driven by other than man power. As the first pit saws were made narrow and parallel, and had to be strained in a frame of wood to give them the proper tension, so it was with the power driven saws, or the English gate, as illustrated in diagrams 5 and 6. The French engineers in Canada did not use the pit saws very long before finding that they could not supply the demand for lumber. As they were located near a river which, by improving, would give them a fall of water of about 20 feet, they decided to erect a mill. Being wholly unacquainted with the manufacture of lumber in this country, as they were the first to go in for it, they found a number of difficult problems to solve, not so much in the improvement of the water power, for they were expert in that, but in the mill. A vast amount of difficult work had to be done. They deserved great credit, for there were no machine shops in Canada at that early date, where necessary machinery could be ordered, and no concrete for foundations. Nearly everything in the line of iron work had to be brought from France. There were no steamers on the Atlantic, making a round trip in two weeks. The shortest period in which an order could be filled was two months, and often three, depending on the weather. By hewing most of their requirements out of the trees of the forest they succeeded in overcoming the difficulties. Only a few months ago I saw on the place where the mill stood, an old shaft of wood, the iron gudgeons in the ends, with remnants of wheels still on them, the whole bearing marks of being a part of that mill. To develop



the water power, they constructed a dam across the river and dug a canal through an embankment of earth and gravel about 12 feet wide and about the same depth, by about 500 feet long. To-day trees 18 or 20 inches in diameter can be seen growing in the canal. At the lower end of the canal they erected a bulkhead and flume and placed a water wheel, as shown in diagrams 3 and 4, except that the crank, bands and tail gudgeon were of iron. I submit herewith a list of the ironwork: 1 wrought iron crank, 4 bands, 1 tail gudgeon, the pin and straps connecting the pitman and saw frame, the stirrup straining the saw in the frame, 3 dogs for holding the log on the head blocks, 1 ring of iron three inches by one-half inch, with notches cut in outer edge, and about four feet diameter, to answer for a ratchet wheel to feed the log forward; 2 saws and 2 iron bars about four feet long, constituted the whole list of ironwork except what an ordinary blacksmith could produce on the premises. But with this simple list of iron, work was started, and one of the industries which has made Canada great was inaugurated. To-day if the same work was to be repeated, no better men could be found than the descendants of the men who first braved the Atlantic in a small sailing vessel, and after landing in the forest, endured great hardships to build up under such adverse circumstances so great an industry.

We come now to the care of the saw, or the pit saw which I have shown by diagram in a former article, i.e., the best shape of teeth suitable to the conditions governing that saw. If the shape of the teeth on a pit saw determines the amount of output it is equally as necessary to keep the teeth of every saw in the best condition to suit the circumstances, regardless of the kind of power driving it. At the time we are writing about, there were no appliances for fitting up saws, like we have to-day. When the teeth became short, and shaped like tooth No. 5 in diagram No. 2, with square gullet, which in all cases is liable to start a crack, a small hole was drilled. The saw was placed on a bench, teeth

upward. Commencing at the point, the dotted line was followed down with a cold chisel. This was the primitive way of gumming saws, but it had advantages, for the process did not expand the saw on the edge, like the press gummer, or the emery wheel. Had it done so, much more trouble would have been in store for the mill man, for the art of hammer-

ing saws at the mill was not thought of, and the saws were hard and brittle. The points could not be spread or widened like those made to-day, to form a point or swage like the diagrams, showing light and full swage. They had, of necessity, to be fitted with spring set. The saws

were filed at the noon hour as they hung in the frame, and again at night after the day's sawing was done. In this way the teeth soon wore down to the shape of tooth No. 5, diagram No. 2, when they were again taken out and the gumming process repeated. For many years the mills in Canada were a copy of this one. I have in mind one in the Eastern Townships, which averaged 1,000 feet per day for 23 years, with only one man doing the filing, sawing and all the repairs necessary. That mill ran the year round, or both winter and summer. Some extra repairs were then done, mostly on the water wheel and flume, and the mill continued to run for some years longer. The cost of living was much less then than now. The man referred to above had only $1 per day to commence with, and board himself. But after a while his pay was raised to $1.25, where it remained while I knew him; that was at the end of 25 years' service. Lumbermen can draw their own conclusions from this, as to whether, to-day, lumber is being manufactured cheaper than it was 30 or 40 years ago with the old style of mill, and, I may add, the old style of man. At that time mill men commenced work at 5 o'clock in the morning, had one-half hour for breakfast at 7 o'clock, one hour for dinner, and worked until 7 o'clock in the evening, or 12½ hours work for $1.25, and board yourself. I did this myself for many years in the commencement of my sawmill career. I am not writing these articles to advocate short or long hours of work, or in the least to interfere with the labor question. I can only give my own experience, after being many years in the sawmill business, which is: if a man takes as much interest in any calling in life as he should, the hours of the day will pass unnoticed. But I have found that it all depends on the interest a man takes in what he is doing. If we find a man who is ever ready to find fault with his surroundings, be they what they may, we have a man who will do only what he is compelled to, by close watching of his employer. Such men are not profitable under any circumstances. They may be well qualified to fill positions requiring skill, but they cannot be depended upon to stay with it for any length of time. Therefore they have, of necessity, to take a place at common labor, at the lowest pay. Then they complain because they are not advanced. On the other hand, I have known men to commence in the mill, carrying slabs, and in a few years advance, by taking an interest in the work, to be superintendent. If they were wanted to do some work for an hour or two after the mill closed down at night, they did not confront you with the question, shall I receive double pay, the first thing. They are the very men who do receive double pay, in the end, for no honest man would wish to have their labor without recompense

Montreal Trade is Rather Quiet

Retail Yards Buying Conservatively—Building Outlook Favorable—Export Trade Satisfactory—Higher Prices for Lath

Montreal Office of the "Canada Lumberman."
May 26th, 1910.

The past fortnight has been productive of very little change in local lumber circles. Retail yards, according to a majority of the wholesale dealers, continue to buy conservatively, and are not stocking and repleting their yards to any great extent.

The building outlook is exceptionally favorable and with the prospects already announced, coupled with those known to be pending, there should be an aggressive demand for lumber in all the required grades for building purposes.

Exporters are now shipping freely, and are in receipt of favorable reports from the different continental ports whither their lumber is being dispatched. The recent decision of the Railway Commission in announcing that the railway companies must submit a new tariff of rates by June 15th of this year, for lumber shipped into Montreal for export purposes, is heralded with delight. Undoubtedly, exporters have for years been martyrs to the railway companies in respect to the rates charged.

Market Conditions

Lath—Most of the mills in the Quebec district have now disposed of their 1910 cut of lath at prices considerably higher than obtained last season. Lath are now held at firm figures and the outlook at present points to high-priced lath for the coming fall. The demand is sure to be good on account of the large amount of building under way and in prospect. Dry lath, too, have practically all been shipped out from the mills, which leaves no old stock on hand to fall back on, as was the case last year.

Hemlock—This class of lumber shows no evidences of improvement and wholesalers still find themselves with heavy stocks on hand.

Pine—Mill and dead cull pine are still sluggish, but the demand for 3-inch mill culls is generally reported very good. 1-inch shipping culls are moving slowly at present, but there is an active demand for 5-4-inch, 6-4-inch and 8-4-inch sizes of shipping culls, and these stocks are being closely held. Upper grades of pine, in all thicknesses, are in good demand at high figures, with very little stock offering on the market.

Spruce—1-inch dry spruce continues to control good prices, particularly when in stocked widths Prices on 2-inch and 3-inch spruce are quoted quite firmly, and cull spruce is also selling freely.

Birch—1-inch dry birch is in fair demand and commands figures from $2 to $3 higher than those obtained last year.

Basswood—All grades of basswood are finding a good sale in the present market and the prices are much stiffer than those of the previous season.

New York Market—Recent reports from New York markets show a somewhat similar condition to that existing in Montreal. Retail yards have not been buying to any great extent and in consequence their stocks are comparatively low. In view of the fact that the building outlook is particularly good, dealers are looking forward to some good business from the big metropolis in the near future. The indications are that spruce timber will rule higher than the present figure, and it is hoped to see the prospect realized within the next month or so.

School of Forestry for Quebec

The Quebec Government has approved of a resolution to make a grant of $4,000 towards the support of a provincial school of forestry, to be established at Laval University. An arrangement has been completed with the university officials for a two years' course, and the province will contribute $8,000 annually to assist in its maintenance. In 1905 several students studied forestry at Yale University at the expense of the province, and one of these, Mr. Piche, will be placed in charge of the new Quebec school. Mr. Bedard will be associated with Mr. Piche. These two members of the staff also graduated from the school in Liege, Belgium in 1905. It is proposed to select the first ten members for the new course by competitive examinations and to give them their course free of tuition charges. Graduates will be known as forestry engineers and will find employment with the Government and with the various lumber companies throughout the province.

Contractor in Difficulty

Mr. Thos. Wand, a well known Montreal general contractor, recently assigned for the benefit of his creditors. An investigation of his assets reveals liabilities of approximately $85,000 and nominal assets of $54,000. Several local lumber merchants are interested, one of them being the largest creditor. The condition of Mr. Wand's finances comes as a great surprise, since he has been in business for a number of years and has always met his obligations promptly. The affair is being handled by the Dominion Mercantile Protective Association, Limited, and the following committee has been nominated by the creditors: Messrs. K. Stinson, N. Sarrisan and J. K. McNutt. It was at first deemed advisable by the creditors to effect a settlement and to give Mr. Wand a release if he could pay thirty cents on the dollar. Some of the creditors, however, considered that it would facilitate matters to have Mr. Wand assign in the regular way, and this was accordingly done. If, however, the estate pays thirty cents on the dollar Mr. Wand will be given a release.

Personal and News Notes

Mr. W. K. Grafftey, of the Montreal Lumber Company, was in Ottawa on a short business trip recently.

Mr. Will Duncan of Messrs. W. & J. Duncan, spent a few days at Sixteen Island Lake recently in search of the wily trout.

Mr. H. W. Gross, Montreal representative of the Thos. Nagle Lumber Company, Limited, has purchased a handsome four-seated "Buick" car to facilitate his business operations.

Mr. C. A. Spencer and office staff have located in enlarged premises at 55 St. Francois Xavier street. The offices are finished with oak flooring of very handsome appearance.

Fire destroyed the sash and door factory belonging to Mr. T. V. Reed, at North Hatley, Que., recently, and about 75,000 feet of lumber was destroyed, besides the building. The loss is estimated at $10,000.

The $2,000,000 plant of the International Paper Company, at Corinth, Saratoga county, near Schenectady, N.Y., was destroyed by fire recently.

The Wanukesha Pulp Company has been incorporated with a Dominion charter. The headquarters will be located at Montreal and the company will manufacture and deal in forest products. The incorporators are: Messrs. W. Kearney, J. M. Collins, M. J. McCreary, P. Millin, T. D. Tansey and R. E Elliott, of Montreal

Owing to the extensive applications received by the Provincial Department of Lands and Forest to dam up certain rivers and to erect works which would effect the flow of the different streams and rivers, the Quebec Government will probably appoint a permanent commission shortly to bring in an extensive report upon the best methods of handling these problems. The commission is expected to consist of two hydraulic experts and one forestry expert.

What is claimed to be the largest leather belt made in Canada has been turned out by the J L. Goodhue Company at Danville. It is 60 inches wide, by 173 feet in length, 3-ply, and weighs nearly 3,000 pounds. Some 330 pieces of leather were used in its construction. It took four men three weeks to put it together after the pieces were cut and ready. This belt is being shipped to the North Pacific Lumber Company for their sawmills at Barnett, B.C.

Annual Report on Quebec Forests

Over One Million Dollars Contributed by Lands and Forests to Provincial Exchequer—Penalties Decreasing

The report of the Minister of Lands and Forests of the Province of Quebec for the twelve months ending June 30th, 1909, has just been published. It shows that during that period the department collected, either directly or through its local agents, $906,360, made up as follows: Stumpage dues, $650,548; ground rents, $206,940; penalties for infringements, $34,110; transfer bonuses, $7,583; and interest, $7,268.

In regard to lumbering operations the report states that during the year these did not seem to show very bright prospects. Nevertheless from information recently received there was reason to believe that they were then about to enter upon a more profitable era. Compared with previous years, the collections of the department show a considerable decrease. In 1907-8 the collections were $978,077. In the previous period going back to the fiscal year of 1899-1900, the receipts were always over $1,000,000, and in the year 1904-5 they were $1,380,186. Not since the year 1898-9 have the figures been so low as during 1908-9. The expenditure during the year upon forest ranging amounted to $16,055 for salaries and disbursements, and the expenditure upon the protection of forests against fire amounted to $20,500. The area of land under license during the year was 67,428 square miles. The timber cut was made up as follows: Square timber, 183,748 cubic feet; spruce, hemlock, balsam, cypress, cedar, white birch and poplar, sawlogs and boom timber, 364,188,011 board feet; white pine and other varieties, sawlogs and boom timber, 122,271,373 board feet; red pine, sawlogs and boom timber, 18,304,030 board feet; white pine 11 inches and under, sawlogs, 49,573,812 board feet; poles of all kinds of timber, 39,940 lineal feet; pulpwood, 359,858 cords of 128 cubic feet each (142,200 cords were exported); firewood, 841 cords; railway ties, 978,443 pieces; pickets, 52,048 pieces; shingles, 4,299 thousands; spool wood, 8,358 cords; posts, 10,644 pieces. The report includes a number of interesting and valuable reports by Mr. G. B. Piche, Forestry Engineer; Mr. W. C. J. Hall, Superintendent of Forestry; Mr. C. S Lepage, Provincial Land Surveyor, and others.

Under the head of fees of various kinds, the sum of $3,178.40 was collected, and that of $24,622.48 was, during the same period, carried to the credit of "Suspense Account."

Thus the Department of Lands and Forests has, between the 1st of July, 1908, and the 30th June, 1909, contributed a total sum of $1,041,226.55 to the annual revenue of the province.

The result of the lumbering operations upon which the department relies for a considerable contribution to the provincial finances, dating as usual a year back, did not seem to show very bright prospects. Nevertheless, from information recently obtained from local agents, Mr. Piche had every reason to believe that they were about to enter upon a more prosperous era, if one might judge by the extent and value of the timber cut during the winter, and that they could count upon a perceptible increase of revenue from that source.

In closing this portion of his report, he called attention to the amounts collected as penalties on timber cut in contravention of the law. By comparing the figures with the corresponding ones for previous years, one was struck with the good results of better organized, more active and more enlightened supervision.

Canadian Pine Deals in England

The market situation for Canadian pine deals in England is discussed by the "Timber Trades Journal" as follows: "Three-inch white pine deals have not been found by the Canadian mills a very profitable stock to carry over this winter, and the demand for them here seems to be declining yearly, and is even now reduced to very limited quantities. Unless a considerable improvement in the United States takes place this year, the Ottawa prices for pine deals and sidings will be affected; but with any demand here for these goods there would no doubt be an increase in shipments. Fourth quality Ottawa 3-inch deals appear to have almost completely gone out of use, and second and third quality are being used sparingly owing to the high value put upon them. First quality deals are, of course, dear, but there is a sale here for the present small production. The increased rates levied by the new Canadian forest duties will send up the value of square and waney pine timber for future shipments and increase the value of landed stocks here."

While it is true that American timber and paper interests own in fee, large tracts of land in Quebec province, it is none the less certain that the action of the Premier (in prohibiting the export of pulpwood cut from Crown lands) will affect the course of Yankee industries. In other words, it will tend to increase the price of paper, force the location of branch paper mills on the Canadian side of the border, and it is indicative of a determined policy of commercial independence upon the part of a Dominion having ample lands for settlement rich in those timber, iron and coal resources which are the basis of industrial empire. The action of Quebec furnishes a precedent for the other provinces, even though the Laurier Government has consented to a commercial peace treaty within a few weeks.—"American Lumberman."

Recent Shipments from St. John, N. B.

	Vessel and Destination	Cargo
May 3	Manch't'r Engineer, Manchester	995,740 ft. spruce deals.
		231,796 ft. spruce deals.
May 3	Victorian, Liverpool	736,460 ft. spruce deals.
May 4	Bengore Head	16,302 ft. spruce deals.
May 7	Wanola, New York City	363,039 ft. spruce deals, etc.
May 7	Jessie Lena, Viney'd Haven, f.o.	1,950,000 spruce lath.
May 9	T. W. Cooper, Quincy, Mass..	124,307 ft. spruce plank.
May 9	Lucia, Vineyard Haven, f.o....	198,478 ft. spruce plank.
		850,000 lath.
May 9	H. Miller, Vineyard Haven, f.o.	339,296 ft. spruce plank.
May 10	J. Arthur Lord, Salem, f.o....	202,787 ft. spruce scant'g & plank
May 10	Priscilla, New Bedford, Mass..	143,590 ft. spruce scant'g & plank
May 11	Vera B. Robert, City Isl'nd, f.o.	161,173 ft. spruce scant'g & plank
May 13	Clifford I White, New York City	1,458,500 spruce lath.

National Slack Cooperage Convention

The annual meeting of the National Slack Cooperage Manufacturers' Association was held at Cincinnati on May 17, 18 and 19, and proved to be one of the most interesting and valuable conventions of lumbermen and allied interests of the year. The first day was devoted largely to preliminary arrangements. The second day's session commenced with an address by President C. M. Van Aken, replete with interesting data of great value to the slack cooperage trade of the country. Following President Van Aken, "Railroads and Freight Claims" formed the subject of an address by J. S. Tustin, freight claim agent of the Missouri Pacific Railroad, with headquarters at St. Louis, Mo.

"The Necessity of Reducing the Waste of Wood," and suggested means of accomplishing this end, was the burden of a conservation address by Assistant Forester W. L. Hall, of the United States Forest Service. The speaker handled the question in masterful manner. The conservation committee's report was a valuable feature of the second day's session, and its presentation, following as it did, the address of Mr. Hall, served to impress the value of the conservation movement upon everyone present.

An address, generally humorous, though serious at times, by James Innes, of Chatham, Ont., resulted in not a little thought, for Mr. Innes told his fellow cooperage manufacturers that they might learn much sometimes by casual comment. Mr. Innes talked briefly on the prices and grades of staves, noting the difference in prices owing to the present condition of the market as compared with the prices during the period of depression. In concluding, he said: "In reading over the programme I notice this serious and startling charge made against one of our members, and the matter should be referred to the committee on grievances and given a thorough airing. It says, 'Who Cut the Price?' and answers, 'Walter C. Hartman, Detroit, Mich.' As the charge is made direct, it would be well to have that gentleman, who is present, explain."

This sally provoked much laughter, and the chairman called upon Mr. Hartman to defend himself, which he did in a few minutes, stating that somebody must have cut the price, as the present low prices of staves testified. By tacit consent it was agreed that a good many had been guilty of cutting the price, but that the outlook at present was so good that it would not be long before prices would be restored, as all indications pointed to a period of better times.

W. E. De Laney, of Cincinnati, spoke on "Grades and Inspections," at the second afternoon session, and struck out straight from the shoulder in every statement he made. His practical experience as a hardwood manufacturer caused his hearers to take an especial interest in his talk, and profit by the data presented.

At the final session a strong resolution was passed for conservation of national resources by the Federal Government. The city of Chicago was selected as the next meeting place, the time of the meeting to be the second Tuesday and Wednesday in November.

The following national officers were elected without opposition: George T. Pettibone, Louisiana, Mo., president, to succeed C. M. Van Aken; A. B. Struthers, Romeo, Mich., was elected vice-president; J. S. Palmer, Sebewasing, Mich., secretary and treasurer; and James Innes, Chatham, Ont.; W. K. Jackson, Buffalo; J. T. Wylie, Saginaw, Mich.; R. Mittlebuscher, Davenport, Iowa; C. E. Chittenden, Ashley, Mich,, and N. V. Turner, Malden, Mo., board of directors.

G. N. Hodge, senior member of the firm of Hodge & Walley, lumber merchants, Sherbrooke, Que., died very suddenly on May 23.

When Mr. James J. Jeffries takes his morning exercise at his training camp in California, he makes use of various mediums for physical development. Often he pulls a cross-cut saw for several cuts of a large log. He likes the sport and likes his saw. It's a Simonds Crescent ground cross-cut saw, and as the man who uses it is an "undefeated champion," so is it also in its particular field, the "undefeated champion" saw of the world.

THE WOODWORKER

Cost Keeping System for a Woodworking Factory

In this age of up-to-date business methods, almost every factory, shop and mill is at some time or other found devising some method of computing the actual cost of producing each item of its output. Possibly no two concerns have adopted the same method for obtaining this result, and very likely several different methods have been tried by various companies, more especially those concerned in the manufacture of lumber, cabinet work and building material, therefore I shall try to explain a cost-keeping system that is somewhat similar to one now in use in a large modern planing mill.

This planing mill's work consists almost entirely of large public buildings—"sky-scrapers"—and occasionally a lot of fixtures. Practically every piece of material handled in this mill must be worked to detail. The perfecting of an accurate cost-keeping system required the co-operation of the heads of departments for several months. Several different systems were given a trial, but none was satisfactory until the present one was inaugurated.

Upon being awarded the contract for the mill work for a building, the number of the contract, together with the contract price, is registered in what we may call the contract book. This contract number is Registered in the contract book opposite the contract number is also a sales number; this sales number is placed on each shop ticket made out for the original contract, but any extra mill work or any changes that may be ordered are given a new sales number. The original contract number is always used, whether the work is extra or otherwise. Each new sales number is registered in a sales book, together with the price agreed

FIG. 3.—TIME CARD.

upon, and each shop ticket is registered in the shop order book. The bookkeeper makes his charges direct from the shop tickets (after, of course, checking them against the dray ticket), and can easily tell an extra item from an original by the different sales numbers, and, by checking off the shop numbers in the shop order book, can readily tell when he has the job complete.

Having the contract, and having it properly registered, we are now ready to bill the work into the mill. For illustration, we will call this contract No. 128 and sales No. 945. Notice the arrangement of the shop ticket—fig. 1, arranged with the idea of getting at the actual cost of production; not only the cost of labor is to be considered, but lumber, glass, hardware, etc., must be accounted for.

The shop ticket is divided into three separate spaces: First, the mill order, then the cutting bill, and, third, the cost memorandum. By using carbon paper three copies of the shop ticket are made (usually on different colored paper), one for the shipping department, one for the office, and one for the mill. The back of the office copy is ruled for posting the time at the end of each day's work—see fig. 2. Each workman is supplied with a pad of time-cards, like fig. 3, which he fills out as he proceeds with the day's work. The mill order division of the shop ticket is made in the office; the cutting bill usually by the foreman of the department to which it belongs, but sometimes even the cutting bill is made out in the office. The cost memorandum is filled in after the work has been completed and the shop ticket has been returned to the office.

As soon as the shop ticket is received back at the office, the office copy, upon the back of which the time has been posted from day to day, is pinned to it. Then we have the entire cost, all itemized, where it is readily seen how much the lumber, bench work and machine work, etc., have cost. After the job is completed, the tickets are filed away in a suitable file, for future reference. Sometimes the cost of a certain lot of work may seem too great; in that case it is an easy matter to locate the unnecessary expense, if any. Running expenses are figured at a certain per cent. of the entire labor cost, as shown by the daily time cards, and very likely will vary at different times during the year.

This system, of course, will require an extra clerk in the office, but this extra expense is more than balanced by the extra saving of time in the mill. There are a few workmen in every shop, mill or factory who will invariably waste some of the employer's time when the foreman's back is turned. This is reduced to a minimum when such a man knows that the entire day's time must be accounted for on his time card. Of course, the better the workman does his work and the more he does of it, the more the boss thinks of him, consequently this system is a benefit not only to the employer, but to the employee as well.—The Wood-Worker.

Tempering Wood-Cutting Knives

In tempering woodworking tools there are several things which are absolutely fatal to steel; the chief one is overheating or burning. This can be easily seen when the tool is ground bright, as cracks of a vertical nature, with dark colored fissures, will show—and the steel should be put on the scrap heap; but cracks of a circular form, from edges or corners of a tool, show that the tool has been unevenly heated while being hardened. By being hardened I mean when the tool is first heated and quenched. Care must be taken when a piece of steel is put in the fire, to not get into contact with the blast, as this will cause it to become surface burnt, show soft places in hardening, and wear badly. The risk of a tool breaking through being unevenly hardened is much greater than through being burnt right through.

In my experience I find the best temper may be obtained by heating the tool evenly to a cherry-red, then quench quickly in oil; but there must be a sufficient quantity of oil for all the tools if more than one is being tempered, for if a small quantity of oil is used it will become heated by the first tool, and the second tool will not contract so rapidly as the first. In small tools this is not so liable to occur.

When the tool has been hardened, grind or polish the inside of it, then lay it on a piece of heated metal to draw the temper to the desired shade. For shapers, moulders, etc., the tool should be drawn to a yellowish-brown. Some men like their tools brown, merging into blue, but I consider this too soft.

When a piece of red-hot steel is being taken out of the fire, it must not be gripped by a pair of cold tongs, as this will cause surface cracks. The tongs should be heated to a dull red. It is a good plan to have a pair of tongs made for the purpose, which will cover as small a space as possible, for the part under the tongs has no chance to contract as quickly as the exposed part, and this is highly important in a shaper tool.

When steel is cut off a bar, to be made into machine knives, before it is hardened it should be ground clean, so that the hardening process won't have to penetrate a skin of rust and dirt. After the steel is tempered, it is frequently necessary to grind it to the exact size, and this is where much valuable work is destroyed. The work of grinding must never be rushed, or the steel will come out covered with surface cracks, for emery and other composition wheels have a tendency to attack the steel, causing the part pressed against them to heat suddenly to a high temperature, uneven expansion takes place, and surface cracks develop.

Moulding, tenoning and other knives of this sort may be drawn out softer at the back than on the working part, but for shaper tools it is best to make them an even temper all over.

There are many fads continually springing up regarding tempering. Some think cold water, rain water, water with a coat of oil on top, is best, but after all they are only fads, for if plain oil is used properly the best results are obtained. If some salammoniac is added to the oil, it prevents the oil sticking to the tool.

The four great points to be remembered are, first, the steel must not be overheated; second, the steel must not be too quickly heated; third, the steel must not be oversoaked; fourth, the steel must be heated well throughout, and not superficially.

The effect of the first is, of course, fatal, as the steel is quite ruined. The effect of the second is to cause excessive expansion and contraction, and steel treated in this way never gives regular satisfaction. The effect of the third is a general deterioration of the steel. The fourth causes breakages, through uneven contraction when the tool is plunged into the oil.

The Action of Saw Teeth and Revolving Cutters

Notwithstanding the present high-class efficiency and development of woodworking (which may be said to be unsurpassed for the production of fine and good work), there are many methods and conditions existing in the operating of tools which are directly adverse to correct theory, and in many circumstances current methods and practice have to be abandoned, for with some kinds of wood the impracticability of revolving irons and saw-teeth cutting against the grain is so evidently demonstrated, and the work produced being so unsatisfactory, that it is expedient, if not imperative, that other plans should be adopted in order that good work can be accomplished.

That woodworking is still more or less a mystic art is proved by the many questions asked, and the many discussions which one reads from time to time. But I must endeavor to confine myself to the chief points of importance.

Dealing with revolving cutters, the ability of the tool depends, 1st, the angle of contact; 2nd, the amount of "canale"; 3rd, temper; 4th, revolving speed; 5th, feed speed, and 6th, the edges contact with or against the grain. The angle of contact of all cutters, especially for soft wood, should be as acute as possible. Many devices are adopted to achieve this desirable position of edge-cutting, such as the bending of irons and the construction of special heads. With the four-sided head only one angle can possibly be given. With the three-sided head the cutting angle is not so acute, as with the four-sided. The highest degree of acuteness can be obtained from a hexagonal or octagonal block, but as there are some disadvantages in connection with the formation of the latter types of blocks, such a design is seldom used.—"Timber News."

The following addresses of lumber importers at Liverpool and Manchester are furnished by the Department of Trade and Commerce in their weekly report:

Birch Squares—Felber, Jucker & Company, 29 Peter street, Manchester; Wilson Bros., Garston, Liverpool; F. Parker & Company, Little Newton street, Manchester; Sandham Bros., Sherbourne Mills, Chorley.

Dowels (birch, beech, maple)—F. Parker & Co., Little Newton street, Manchester; Henry Hughes & Company, 12 Paradise street, Liverpool.

Door Panels—James Wheeldon & Sons, Regent Road Saw Mills, Salford, Manchester; Henry Hughes & Company, 12 Paradise street, Liverpool.

Birch, Beech (Lumber)—Whiley & Company, 21 Deansgate; Southern & Nephew, Liverpool Road; F. Parker & Company, Little Newton street; F. M. Wilson, 23 John Dalton street, Manchester.

Deals (spruce and pine)—Southern & Nephew, Limited, Liverpool Road; J. & W. Bellhouse, Miles Platting; James Wheeldon & Sons, Regent Road, Salford; Warwick Saw Mills, Gt. Ancoats street; W. Evans & Company, 132 Eccles New Road, Weaste; F. Parker & Company, Little Newton street, Manchester.

Elm (sawn coffin)—Fitzgerald Bros., Ashton Old Road, Manchester; Robert Bury & Company, Spencer street, Bootle, Liverpool.

It is always dangerous to predict, but every man is entitled to his guess, and I think I am safe in saying that the maximum output of the following kinds of lumber has been passed: White pine, oak, eastern hemlock, eastern spruce, cypress, yellow poplar, cottonwood, ash, elm. In a second group I shall place the following woods, the cut of which probably will run about steady for a few years, or perhaps increase somewhat: Yellow pine, maple, red gum, chestnut, beech, redwood, birch, basswood, cedar, hickory, sugar pine, tupelo and walnut. This brings us to the last group the cut of which, with favorable market conditions, we may expect to increase heavily. Here there should be no doubt about placing Douglas fir, western hemlock, western spruce, western yellow pine, western white pine, lodgepole pine, larch and white fir.—R. S. Kellogg.

The Retail Dealer and His Problems

Credit and Cash Sales—The Architect and Odd Lengths

Credits of the Lumber Yard.—By W. F. McCue

My experience having been almost, if not entirely, with the smaller yards, whose trade comes largely from the farmer, the stockman and small merchant, I will not attempt to cover what might be called "city trade," but will treat with the subject as the country yard has to do with it.

This is a subject on which could well be written a book rather than a paper—one which is deserving of a year of solid thought instead of a day of hasty composition, and entitled to serious consideration from a committee selected from the oldest and wisest of our membership in place of entrusting the problem to one who is frank to admit he has been unable to handle the matter in anything like a satisfactory manner.

I am sure I will not meet with argument from those who operate a retail yard when I say it is the one part of the business which does most to make the business unprofitable on the investment instead of profitable, unpleasant instead of pleasant and causes envy toward the neighbor who is more fortunate in having embarked in a line of trade which by co-operation, later moulded into custom, has established for his terms of sale bordering more on a cash basis.

I do not think the extension of credit from the standpoint of direct losses, meaning accounts charged to profit and loss, to be the most serious phase of this matter, our lien laws affording protection against large losses and as a rule limiting the charge-offs to the accounts too small to justify liens or heavy expenses for collecting—the exception generally being where we have placed an unworthy confidence in a contractor and allowed the responsible party or purchaser, in fact, to be released and our time limit for lien to expire. The fact, however, that small losses are the general rule has undoubtedly played a very important influence in tearing down rather than building up clearly defined and well established terms of sale to govern the extension of credit; at any rate it must be admitted and seriously deplored that there are very few country yards to-day who have succeeded in convincing their customers that they have any regular terms of sale which must be complied with, and if we were asked the question as to what our terms are we would probably be compelled to say, "It all depends on circumstances."

A few days ago I asked a friend of mine, who operates a retail yard, what were his "terms of sale." He looked at me in a blank sort of manner, apparently not understanding my meaning. I again said, "your terms of sale." "Oh," he said, "I simply say 'drive in.' " I think this was a very frank statement and one which pretty well covers the terms of sale of most country yards.

I insist it is all wrong; I contend we should have clearly and well defined terms of sale and that these terms should be absolutely ironclad and any lumberman refusing or failing to co-operate with his neighbor in building up and maintaining these terms is ignoring the most necessary step of reform to make the retail lumber yard investment a profitable one.

To demonstrate the necessity of a reform movement in this direction I wish to give it as my best judgment that of the total business done by retailers 25 per cent. of the amount is loaned out to customers; that for every $1,000 invested in stock necessary to conduct business retailers have $4,000 invested in notes and accounts and that their total net gain for the year does not represent over 40 per cent. of the amount outstanding. In other words, the total profits for the last two and one-half years are loaned out to customers. This means that we have allowed ourselves to embark in the banking business, and are taking away from the banker the business to which he is entitled and at the same time decreasing our profits on our investments approximately 33⅓ per cent.

It is now an admitted fact among lumbermen that we can no longer hope for the profits of earlier days; that we must content ourselves with a reasonable rate of interest on our investment. If this condition is to be improved upon it must be done by reducing investments, and if investments are to be reduced it must be done by conducting our business with a less amount invested in outstanding accounts, and if this result is to be accomplished we must take the necessary step and co-operate with our neighbor, adopting rules of credit which will mean more than the terms we now have printed on our billheads and which will limit the length of time we are to have our money loaned out to our customers.

I would endeavor to correct this existing evil by having the lumbermen co-operate with each other by counties or districts. Associations of this kind would be absolutely within the requirements of the law and there could be adopted uniform terms of sale which in all cases would govern.

In the way of a suggestion as to what these terms should be, I would advise a discount for cash of 2 per cent.; would recommend that our regular terms of sale stipulate that all bills are positively due the 10th of the month following that in which goods are purchased, and I would consider as the most important feature of these terms the limiting of credit under any and all circumstances to 60 days from date of purchase, which is the time allowed us to pay for our goods from the date they are put in transit.

I think it is important to every retailer that he use in his business a duplicate or triplicate sales slip and that for each sale one of these slips or tickets be made out and signed by the buyer, or, if necessary to convenience, by the party receiving the goods, and on this ticket I would print conspicuously these terms in red ink, and would then insist on them to the letter. Your best customers can take no offence when you give them your limit of credit and there is no reason why the time extended should be longer than that in which you are absolutely compelled to settle or be discredited with those from whom you buy.

You may figure your money is only worth a certain rate of interest, but if you do, your line should be the banking business, not the lumber business, because in that line you would be loaning a part of your depositors' money, and will not be a menace to your neighbor in preventing him from making a percentage on his investment above the customary rate of interest, and he is certainly entitled to it because of it being a more hazardous business than securities placed in a safety deposit vault.

Terms of Sale for Retailers' Purchases

A practical address upon "Terms of Sale" was delivered by R. G. Keizer at the recent meeting of the Western Pine Manufacturers' Association. Mr. Keizer's remarks outlined in concise form the practice of the companies he was acquainted with.

"The subject 'Terms of Sale' at first struck me," he said, "as not being of much importance, but when I began thinking it over, I found it contained some things of vital importance to us. Looking at the matter from the standpoint of a salesman, I presume a great many of us have never considered what it really amounts to. In the first place, 'Terms of Sale' should be as much a part of our contracts as the prices and time of delivery.

"Furthermore, the matter of discounts should be in all cases taken into consideration when making prices. As a matter of fact, a large majority of manufacturers would realize a much better selling average for their lumber, were it possible to eliminate the discount feature entirely. However, this seems to be a custom which cannot easily be abolished and has developed into an evil which we should at least endeavor to control. Several years ago the Mississippi Valley Lumbermen's Association adopted a set of 'Terms of Sale' which included a discount feature for prompt payment of invoices; these terms were practically the same as were adopted by the Wisconsin Valley Lumbermen's Association, and finally by the outgrowth of these two associations, the Northern Pine Manufacturers' Association. Generally speaking, the 'terms of sale' used by individuals and associations do not differ materially, except in the time allowed from date of invoice, in which discount may be taken by the trade. The usual discount allowed for so-called prompt payment of invoices has been and is now, 2 per cent. on net amount after deducting freight, and inasmuch as we seem to be obliged to give this discount. what we should aim to do is to cut the time limit to the minimum.

"In this district it has been customary to allow 2 per cent. discount for cash on arrival of car; this amounts usually to 30 days, which means giving 24 per cent. per annum for the use of the money which we could probably borrow from our banks for 6 per cent., 7 per cent. or 8 per cent. per annum. By making the time limit 15 days from date of invoice, we reduce the rate of interest to 16 per cent., and surely this is enough to pay for money.

"On top of all this, we should consider the discount when making prices. Should we be selling lumber at $10, the 2 per cent. discount reduces the price to $9.80; $15 to $14.70; $20 to $19.60, and $50 to $49, so that we should make the time for discounting as short as possible, if we must give a discount. Now that all the associations west of the Mississippi, including the Northern Pine Manufacturers' Association, Yellow Pine Manufacturers' Association; Cypress Association, Pacific Coast Shippers' Association, Oregon & Washington Association, California Association, Montana Association and British Association have adopted what is called 'Uniform Terms of Sale,' I believe we should not hesitate to do the same. These 'Terms of Sale' I will read:

All freight charges are payable in cash on delivery, title not to pass until freight is paid.

Payment of freight to duly authorized agent of the transportation company by which lumber is shipped, at point of destination, shall be payment on the bill. The original freight receipt shall be accepted as evidence of payment.

The bill for lumber, not including freight, is payable in 60 days, and

is subject to a discount of 2 per cent. if paid within 15 days from the date of invoice.

If paid after 15 days and within 30 days a discount of 1 per cent. will be allowed, but no discount shall be taken after 30 days from the date of the invoice.

Remittances must be made free of charges. Exchange will be charged to your account. Accounts are subject to sight draft with cost of collection if not paid at maturity.

If car is not received within 15 days from date of shipment and you desire to take 2 per cent. discount, remit the amount of the bill, less the item of freight, which can be estimated.

Prepayment of bill will not be taken as acceptance of the shipment, and the right to make corrections or complaint will not be forfeited thereby.

All bills subject to draft after 60 days.

Eight per cent. interest per annum will be charged on all accounts after 60 days.

The lumber shipped is sold on the standard grades of the Western Pine Manufacturers' Association, and in case of dispute over the quality or the tally of the lumber, the official inspection by the said association shall be taken as a basis for settlement. Stocks must be held intact until inspection and settlement is made, and complaint must be filed within five days after the receipt of the lumber

In case of transfer of business, insolvency or suit begun by any other creditor, bill becomes immediately due.

All orders are accepted subject to delays caused by unavoidable accidents, strikes, riots or other causes beyond our control. It may be revoked by us after acceptance on account of riots, strikes or stoppage of labor; also from other causes interfering with, obstructing or blocking the usual routes or transportation.

Orders from strangers must be accompanied by cash or satisfactory references."

Cash Transactions the Proper Ideal

Cash sales should be the ideal for the retail lumber dealer. So many and so varied are the excuses of the farmer for delaying payment that the retailer should be ever on the alert for an opportunity of educating his customer to appreciate the advantage of paying cash. That this business alertness is a distinct money saver is indicated by a story told recently by a retailer in addressing a convention of retailers: "An incident along this line which illustrates the fact that a little care on the part of the dealer can often result in a cash sale instead of a time sale occurred in our office recently," he said. "A farmer customer bought a small bill of lumber for a shed, saying, before I gave him the figures, that it would be a cash sale; but when we had arrived at a price he asked me if I had any objection to giving him six months' time. I knew he had money in the bank and asked him about it, and he admitted he had. but said it was drawing interest and he did not like to disturb it. Now I knew he had sold a load of hogs the day before, and I suspected he had done it in order to pay for the shed. I asked him when he had deposited the money, and he 'didn't just know.' I asked him if he hadn't the deposit slip in his pocket, and after some fumbling he produced it, and sure enough, it was dated that morning. 'Amos,' I said, 'you sold those hogs to build the shed, didn't you?' and he had to admit it. 'Then as I am letting you have the lumber for the shed, that money the hogs brought is morally mine, isn't it?' and he said 'I guess that's so,' 'and paid the bill.

Credit is for the assistance and accommodation of those who need help in their affairs. It should be for them and them only. There is no reason why you should carry a man who has money in the bank, but if you do not ask for it, he will not bring it to you. You must simply treat outstanding accounts as an expense item. You cannot realize enough in a year on these accounts to buy yourself a suit of clothes. Bankers are in the money lending business but we are not. Just insist and you will get the money."

An Architect who Favours Odd Lengths

Retail lumber dealers have with somewhat general accord opposed the campaign for the use of odd lengths of lumber, because upon them alone will fall the difficult duty of educating the architect and the consumer to use them The architect would no doubt be quick to take advantage of odd lengths after a little education. The consumer alone would be the difficult one to convert. That the architect is already disposed to look with favor upon the introduction of odd lengths is forcibly shown by a letter from a Milwaukee architect to the Editor of the "Improvement Bulletin."

Referring to a discussion on odd lengths, the letter said: "We know of nothing in the building trades where such an important saving to the country at large could be made as in this class of material. For an architect to design in units of two feet is practically impossible, though forced to do it occasionally. The result is that we are obliged to waste either the 4 inches 20 feet of lumber, or waste our clients' money building up to the even length, or bring about inconvenience by building down to an even length.

"I refer particularly to studding, joists and girders. Take, for instance, an ordinary frame or veneer residence. Suppose you consider only the outside studding, 2x6-inch 16-foot centres, building to be 40x60 feet. Total number of studs required, about 154. If studs are 20 feet long, total lumber bill would be 3,080 board feet. If we wish to use 21-foot studs, 154 feet would be wasted. At $40 per thousand this would amount to $6.16—the cheapest way for the client is simply to disregard it and pay for the waste. No intelligent architect would think of advising a client to save this $6, with the risk of spoiling a design, or having even a greater expense in another place, or material due to this very saving, and from your records you can easily estimate the tremendous loss that such methods amount to when the building operations of the whole country are considered.

"In factory or mill construction the loss is even greater. Here, the size of lots, or placing of machinery absolutely govern. Moreover, even if we space our material so that we have even lengths on the first floor, waste will occur on the upper floor, due to thinner walls.

"Moreover, the public is pretty well educated up to the even length idea, and we believe that nothing is more annoying to the architect than to try to live up to such requirements. He puts in more time and energy in such instances than the actual waste is worth.

"We can see no better way for the building trades and architects to help the conservation idea—and incidentally themselves—than by insisting, where possible, on the manufacture of odd length stuff."

Here is a new idea. Instead of being opposed unequivocally to the use of odd lengths, an architect says that not only should his craft insist on its manufacture and use, in the interests of economy and convenience, but he also says that the building trade would be well served by the same thing. Whether or not this feeling is common among architects is not known, but the arguments offered by the Milwaukee gentleman appear logical.

How to Arrive at a Customer's Financial Standing

By D. E. Swinehart

How shall we arrive at the standing, from a financial standpoint, of a new customer? Ask for a reference? Yes. If he refuses to give it very frankly, drop him and you will be right in most cases. I remember once refusing a corporation credit because they refused to give me any information as to their responsibility, except to state that they paid their obligations when they were due. They did, for a time, and their account, with our competitors, was a large one, but the crash came eventually and my friends did the business at a loss. Perhaps the proposed customer gives a bank reference which is considered in some quarters as gilt edged, but there is an old saying, "If you want to know anything about a bank's customer, do not ask the bank." Perhaps he refers to a merchant or two, and if they give him a good reputation it is a fair presumption that he is all right. Personally, added to what information I can gather from the customer himself, I depend very largely on my first impression in the case of an individual, and am convinced that if one absolutely followed the practice of taking his first judgment and acting upon it, he would be right many more times than he would be wrong. One should not be afraid either, to say, "No," if his investigation or judgment tells him that there is the least doubt of being able to collect after opening the account.

For the second proposition let us consider—the length of credit and the best method of collection when due. Of course this problem depends very largely, if not almost entirely, upon the local conditions, but short credits are always better than long, if one wishes to keep the nimble dollar at work. The time of settlement, however, should be thoroughly understood when the credit is made and when one has obtained a promise of a definite date for payment he should bear it in mind and insist that the promise be reasonably kept or a new arrangement made. for one never loses the good will of an honest man or even a fair-minded one, by insisting upon his just dues. If a man makes me a promise to pay on the 15th of February and does not do so, I see to it that the matter is brought to his attention and want at least to know "why."

Under a third caption let us consider for a moment, if you please, what to do with the man who gets all he can from you without paying and then takes his trade to the other fellow, without making any attempt whatever to pay you. This, my brother, is the kind of a proposition that we all have to contend with and a case where it pays to get together, talk it over with your competitor, tell him where and how you were stung, and it will not only help you both, but perhaps the customer himself may become a better man and change his tactics when he learns that his sins have found him out. Many a man buys all he can on credit and then when it comes to a cash deal goes elsewhere. We will all take his cash and he will, perhaps, if we do not know his record, establish a credit on the strength of his cash transactions. Again I say, "Get together, my brother; get together."

A number of the smaller cities in which I am somewhat acquainted have formed what they are pleased to term a "Merchants' Protective

Association," the plan on which it is conducted being that each member pledges himself to report on the standing of each and every one of his customers from his point of view, as to whether they are "prompt," "slow," or "very slow," and this information is compiled in book form, alphabetically arranged, making a commercial rating for practically every one in the city and surrounding country, so far as payments go. Payments of account on or before the 10th of each month are rated as "prompt," after the 10th and within 60 days are rated as "slow," and after 60 days as "very slow." The merchant also pledges himself to report at least every 60 days on any changes, that is, one may be "prompt" and through neglect or for some other reason comes under the "slow" rating; then the merchant must so report, and again when he redeems himself. A copy of the book is furnished each member, as well as the change sheets to be kept for his own exclusive use, the same as Dun or Bradstreet. Retailers who are members of such associations are loud in their praise of its effectiveness, as it gives an unbiased statement, not from one concern but from several. The book shows, for illustration: John Smith, 3P, 1S, 1V.S., which interpreted means that John Smith deals with five members of the association, with three of whom he is "prompt," one "slow," and one "very slow." No one but the secretary of the association knows the identity of the member making the report. There is no obligation to sell or not to sell, only the information from which one must draw his own conclusions, and it occurs to me that such associations should greatly reduce the percentage of bad accounts and amply repay the cost.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry:

855. Spruce and pine lumber—An American broker doing business in Havana desires to establish a connection with a large exporter of spruce and pine lumber.

879. Lumber—An English speaking commission firm in Havana wishes to represent large exporters of Canadian spruce and white pine in the Havana market. This firm claims to be in a position to make immediate sales to responsible houses.

880. Lumber—An American broker who has been selling Canadian lumber in the Havana market wishes to establish new connections with Canadian exporters who are prepared to cater to the market. Good references will be furnished.

904. Wood dowels—A Yorkshire firm would consider prices and particulars from Canadian manufacturers of wood dowels.

914. Pitch pine boards—A Manchester firm asks for dimensions and prices of pitch pine boards from Canadian exporters.

916. Hickory hay fork handles—A Manchester firm asks for prices of hickory hay fork handles from Canadian manufacturers.

917. Pine shorts—A Lancashire firm asks for prices of pine shorts, 6 feet up to 9 feet, from Canadian exporters.

918. Pine lumber—A Manchester firm asks for dimensions and prices of pine lumber from Canadian exporters.

921. Oak spokes—A Lancashire firm asks for prices and dimensions of oak spokes from Canadian manufacturers.

924. Birch dowels—A Manchester firm asks for prices of birch dowels from Canadian manufacturers.

928. Wood split pulleys—A Manchester firm now buying in the United States asks for catalogues and prices of wood split pulleys from Canadian manufacturers.

931. Barrel heads and staves—A Liverpool firm wishes to correspond with Canadian manufacturers of barrel heads and staves.

932. Spruce deal ends—A South African firm of manufacturers, importers and house furnishers, desire to be placed in communication with Canadian manufacturers and exporters of spruce deal ends, lengths about 6 feet; sizes 9 inches by 3 inches.

933. Miramichi or Quebec birch—A South African firm of manufacturers, importers and house furnishers, desire to be placed in communication with Canadian manufacturers and exporters of prime quality of Miramichi or Quebec birch of the following sizes: Length, 10 feet and up; width, 6 inches and up; thickness, 2½ inches, 3 inches and 4 inches.

934. Dry Canadian white oak—A South African firm of manufacturers, importers and house furnishers, desire to be placed in communication with Canadian manufacturers and exporters of prime quality of dry Canadian white oak: Length, 10 feet and up; width, 6 inches and up—average 10 inches; thickness, ¾-inch, 1-inch, 1¼-inch, 1½-inch, 2 inches, 3 inches and 4 inches.

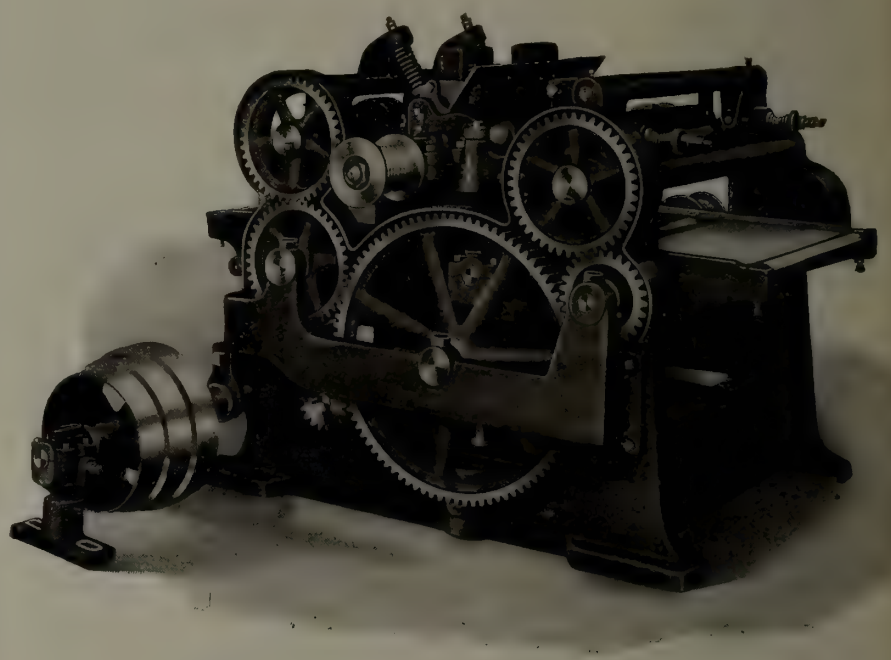
935. Common 3-ply veneers, etc.—A South African firm of manufacturers, importers and house furnishers, desire to be placed in communication with Canadian manufacturers and exporters of common 3-ply veneers, or drawer bottoms in sizes about 36 inches by 45 inches, thickness 3-20-inch. Also better quality for panel work, thickness 3-20-inch and ¼-inch. Sizes from 22 inches to 38 inches by 16 inches. Finished same wood both sides, free from knots, and sandpapered, in the following woods: Plain white oak, satin walnut, black walnut, mahogany and ash.

943. Machine tools and woodworking machinery—A Glasgow firm wish to get into touch with Canadian importers of machine tools for engineering works; also woodworking machinery.

954. Agents—A Yorkshire company manufacturing woodworking machinery of all kinds wish to get into touch with suitable agents in Canada to sell their manufactures.

975. Maple for bicycle rims, hardware, lumber, etc.—A prominent timber importer in Havre, France, is in the market to purchase 150,000 maple strips suitable for bicycle rims. Also interesetd in other hardwood lumber. American references.

Machinery and Equipment



A New Double Cylinder Surfacer

The machine which is illustrated herewith is an entirely new one, manufactured by the firm of J. A. Fay & Egan Company, 465-485 West Front street, Cincinnati, Ohio. It is known as their No. 140 new patent double cylinder surfacer, and is built along the same lines as their old No. 140 machine, but in addition to the features of the older tool it has improvements specially designed to give it a maximum of efficiency. It is so well made that it is claimed that it will stand up serenely to the roughest kind of usage, and at the same time is so finely made that it will do light and delicate work perfectly.

The manufacturers have given special attention to the feed works, consisting of four powerfully driven rolls. The in-feeding rolls are driven down, which enables the manufacturers to attach their spring hold down, giving an even pressure on the material which is, they claim, in every way more powerful and satisfactory than the old system of weights and levers usually found on a surfacer.

The in-feeding roll is made in four sections, divided or solid, as may be desired. The sectional and divided rolls permit of the feeding of pieces of varying thickness through the machine at one time.

The manufacturers claim that stud gears make a weak feed because the bearing soon wears out and the gears become loose, wabbly and unstable. In order to eliminate them in their machinery, they have

New Patent No. 140 Double Cylinder Surfacer

keyed the gears to shafts running between two bearings, with outside bearing in a heavy outside bearing frame.

This machine has a capacity for material 24, 27 and 30 inches thick.

The manufacturers have issued a new circular describing this machine in detail, and also showing a half-tone photograph of the machine. They will be glad to send the circular to interested readers upon request.

Carborundum and Electrite

The Vincit Company, Limited, manufacturers of carborundum and electrite, 67 Aldersgate street, London, E.C., have issued an attractive illustrated catalogue of their products. The book is handsomely printed in two colors and contains much valuable information relating to the use and manufacture of carborundum and electrite. Sawmill owners and users of edge tools in general will be interested in this catalogue, as it presents to them the latest information upon the all-important subject of keeping tools sharp. Of particular interest to sawmill men is a new type of wheel manufactured by the Vincit Company for sharpening the teeth of saws more effectively, and without in the least degree drawing the temper.

A Useful Trade Souvenir

Messrs. Sadler & Haworth, the well known tanners and manufacturers of oak leather belting, mill supplies, etc., are issuing a neat telephone directory cover. which is sure to be appreciated by the recipients. On the inside back cover a useful table is found which gives the price list per running foot adopted by belt manufacturers of Canada in 1907, also for solid, twist and cut lacing.

Poles and Posts in Good Demand

Longer Lengths Selling at Advanced Prices in Ontario—Prices Firm at Ottawa—Activity in Quebec

There has been a considerable advance in the prices of the longer lengths of telegraph poles in the Parry Sound district during the past few weeks. The advance applies to all sizes of 35 feet and up. For 35-foot poles an increase of 25 cents has taken place. 40-foot poles are 50 cents higher, 45-foot poles 75 cents higher, and 50-foot poles $1 higher. 30-foot poles are not in such good demand, and the price has declined by about 35 cents. 25-foot poles are about 25 cents cheaper.

Wholesale prices of telegraph poles at Parry Sound are as follows:

Telegraph poles, 25 feet long, 6-inch top	65c. to $0.90
Telegraph poles, 30 feet long, 6-inch top	80c. to 1.00
Telegraph poles, 35 feet long, 7-inch top	2.00
Telegraph poles, 40 feet long, 7-inch top	3.00
Telegraph poles, 45 feet long, 7-inch top	3.75
Telegraph poles, 50 feet long, 7-inch top	4.50

In the Ottawa district poles and posts are selling well at prices which show little change. The 50-foot length, however, has advanced about $1, and is selling at $10 to $11. Wholesale prices of ties and poles at Ottawa are as follows:

No. 2 railway ties	0.25 to 0.30
Cedar telegraph poles, 25 feet long, 6-inch to 8-inch top	1.25 to 1.75
Cedar telegraph poles, 30 feet long, 6-inch to 8-inch top	1.75 to 3.00
Cedar telegraph poles, 35 feet long, 6-inch to 8-inch top	2.50 to 4.00
Cedar telegraph poles, 40 feet long, 7-inch top	4.25 to 4.75
Cedar telegraph poles, 45 feet long, 7-inch top	5.25 to 6.25
Cedar telegraph poles, 50 feet long, 7-inch top	10.00 to 11.00
Cedar telegraph poles, 55 feet long, 7-inch top	11.00 to 13.40
Cedar telegraph poles, 60 feet long, 7-inch top	16.50

At Quebec shipping points, telegraph poles, in 30, 45 and 50-foot lengths are not in active demand and show no tendency to advance. 35 and 40-foot poles with 7-inch tops, on the other hand, are finding a ready sale and are now commanding much higher figures than heretofore. Prices for telegraph and telephone poles are quoted as follows, f.o.b. shipping points in Quebec:

Ties—Standard railway ties, 6-inch	$0.45 to $0.50
Mill run cedar ties	0.38 to 0.45
Telegraph poles, 30 feet long, 6-inch top	$2.25 to $2.50
Telegraph poles, 35 feet long, 7-inch top	2.75 to 3.00
Telegraph poles, 45 feet long, 7-inch top	4.50 to 4.75
Telegraph poles, 40 feet long, 7-inch top	3.50 to 3.75
Telegraph poles, 50 feet long, 7-inch top	5.75 to 6.00

Conservation Idea Spreading

Conservation has obtained a strong hold upon the people of Canada during the last year or two. The latest encouraging symptom was the public meeting held in Convocation Hall of the University of Toronto on May 18th, when Hon. Clifford Sifton, chairman of the Conservation Commission, and Hon. Frank Cochrane, Ontario Minister of Lands, Forests and Mines, made important announcements regarding the conservation of forest wealth. Mr. Sifton's announcement is of great national importance, involving no less than the preservation of a tract of forest land on the eastern slope of the Rocky Mountains, 400 miles in length and from 50 to 150 miles in width. This will be the greatest forest and game preserve in the world. Hon. Frank Cochrane intimated that Ontario intended to lead the van in the direction of provincial co-operation by establishing a large forest area for use of the students of the University of Toronto and by continuing its policy of setting aside extensive forest reserves.

Confusion in Names of Various Woods

The commercial names of some varieties of wood give rise to much confusion. Products of coniferous trees are designated indiscriminately as pines or firs, without regard to their botanical distinctions, and the trade names also vary in different countries, says the "Timber Trades Journal," of London, Eng. For instance, the yellow pine of the American trade is our pitch pine, and our yellow pine is known on the American continent as white pine. Again, what is called here British Columbian or Oregon pine, is called Oregon fir in the districts in which it grows. The many "whitewoods" on the market, coming from widely separated parts of the world, might with advantage be specialized and more definitely designated. In hardwoods, it is even more puzzling still to identify many imported varieties by their trade names, on account of their greater variety and the characteristics which many of them possess in common.

In accordance with a resolution passed at the annual meeting of the National Lumber Manufacturers' Association, in New Orleans, La., recently, the official proceedings of that meeting are being published in book form. This book will contain about 300 pages, and will be indexed so that all matter may be readily referred to. It will be sent, while the edition lasts, for 50 cents a copy, to anyone who applies to the National Lumber Manufacturers' Association or Leonard Bronson, manager, Fisher Building, Chicago.

Securing the Cooperation of Employees

Mr. A. E. Watts, president of the Wattsburg Lumber Company, Proctor, B.C., has formulated a plan by which each man in the employ of the company will have an opportunity to share in the earnings of the company, in addition to his wages. Mr. Watts proposes to set aside each year a percentage of the net earnings of the company, which persentage will be determined upon a sliding scale in ratio to the amount of such earnings, the ratios being as follows: Up to $10,000, 10 per cent.; over $10,000 and under $20,000, 15 per cent.; over $20,000 and under $30,000, 20 per cent.; over $30,000, 20 per cent.; over $50,000 and under $100,000, 25 per cent. The amount thus set aside will be divided among the men in proportion to the scale of wages earned by them. If any of the men desire to acquire a direct interest in the business, they will be given an opportunity to purchase the ordinary stock of the company and thus share in its total earnings. A further inducement is offered by the company to attract men and their families to make a permanent home at or near Proctor, which place is the centre of a fruit-growing district. Employees are offered land in small or large lots on the easiest terms of purchase, with lumber and all necessary supplies to build houses for themselves, the time for payment for which can be arranged to suit the purchaser or, if he chooses, he can hold the land under perpetual lease at a small rental.

Forestry Survey on Hudson's Bay Railway

In anticipation of the early construction of the Hudson's Bay Railway, the Forestry Branch of the Department of the Interior has sent out this year four parties with instructions to make an inspection of the timber along the proposed route of the railway. The parties are composed of trained forest engineers, experienced timbermen and fire rangers. Of the four parties, two will proceed by way of the Pas, the present terminus of the C.N.R. line, toward Hudson's Bay. One of these will start its inspection at the Pas and proceed up the Nelson river. The other will make at once for Split lake. The other two parties will go in by way of Norway House, at the north end of Lake Winnipeg. One of these will make its headquarters at Oxford House, and will proceed to inspect the timber around Hayes river, God's lake, Fox river and other streams, reaching up as far as York Factory. The other will make its way from Oxford House to Split lake, inspecting the timber en route. All the parties will, in addition to inspecting the timber, keep a sharp lookout for forest fires and will have authority to appoint and employ fire-rangers where they think necessary. Two of these parties, and probably a third, will winter in the territory they traverse, and will be on the spot ready to continue operations next spring.

Woods Which Have Overcome Prejudice

"Under the spur of necessity, how readily we change our ideas of the value and desirability of using material which we formerly considered of little or no use." This rather sage observation was volunteered by the same gentleman, suggested doubtless by his previous remarks. Elaborating, he continued: "Even during my brief connection with the lumber business I can remember the time when hemlock was regarded as of no value whatever. Everybody agreed that it was too hard, brittle, and that its tendency to warp and twist made it of no use as a building material. A good share of the woods that grew in the northern forests were rejected for various supposed good reasons. There was even a pronounced prejudice against Norway, white pine being regarded as being the only real serviceable lumber. To-day hemlock, balsam, fir, jack pine, poplar and almost anything that can be used to produce a stick of lumber four inches square is utilized and goes into consumption without any protest. Even some of the cull birch, which a few years ago was disposed of as mill wood, now is used for sheathing purposes. Think of the carpenter who used to kick because he had to drive nails into hard hemlock now using bone dry birch that cannot be penetrated with any ordinary wire nail. Speaking of using birch, I remember the first time I had occasion to use this material for interior finish. Naturally for some time previous various kinds of hardwood had been utilized in the construction of fine residences in the city. In the country towns, however, white pine had been plenty good enough for us, although some little basswood for siding and interior finish had come into use. In using this birch, we took a good deal of pains to prevent it being marred by nail holes. With a small brush we used alcohol to moisten the wood at places where we were to drive the nails. Then with a sharp instrument we cut into the grain of the wood and lifted up a good sized sliver. In this aperture we drove our nails and glued the sliver back into its place. When finished you could not possibly detect that the wood had been disturbed."—Mississippi Valley Lumberman.

The London, Eng., agency of the well known business of J. Burstall & Company, of Quebec, has been converted into a private company.

Neil Watson, cooperage manufacturer, Mull, Ont., reports as follows: "The condition of the market is looking brighter. Business with us is very good. For No. 1 stock the prospects are good, but No. 2 stock will be a little slow."

CAMP DEPARTMENT

Lumber Camp Labor Troubles—A Solution

Editor "Canada Lumberman,"—"I am sick and tired of being asked to do things for the shantymen. They are the most unsatisfactory men to deal with one could imagine. We pay them double the wages they used to get a few years ago, and give them better board than we have in our own homes, and yet they are not satisfied. The mere expenses of taking men into the camps to supply the place of 'jumpers' runs into thousands of dollars a year."

The above sentiments of an Ontario proprietor of lumber camps have been uttered time and again by many others, when their patience has been unduly taxed by the unreasonableness of the men in the camps, and that there is good cause for such complaints the writer very well knows.

After thirty years of business experience, during most of which time he had numbers of men working under him, the writer's attention was attracted to conditions in the woods. Being a business man first and preacher second, he preferred to earn his own support while doing mission work amongst the men, rather than ask them for collections. In the course of his work as accountant in various offices and camps, he was struck with amazement by what to him seemed preventable losses, in running camps. Drawing one proprietor's attention to these, the answer he got was, "How can you help them with the class of men we have to deal with?"

The Only Remedy for Camp Troubles

There is only one answer to this, namely, get a better class of men.

"Oh!" one replies, "that is easier said than done. The good men we would like to get are not attracted to the woods."

"Why are they not?" There is no place in Ontario where a man can make money quicker than working in the camps, while the board is far in excess of what men get in the cities. The hours of labor, taking the whole season through, are not unreasonably long, and the nature of the work appeals to every strong, healthy man. If good men are not attracted by the work, there must be a reason, and in the writer's opinion it is not hard to find.

The lumberman has been treated as if he was an animal rather than a man. That is to say, no provision has been made for the cultivation of his mental or moral nature, and the men to-day are just what their environment has made them. During the day his work has been in the best possible surroundings, but as soon as night comes there is no place for him to stay except in a dingy sleep camp, so poorly lighted generally that reading is only possible by the use of a stable lamp hung in the bunk. On a wet day or Sunday in mid-winter, the same thing is true. For intellectual food he has to sit and listen to the foul stories told by men who have been already degraded, so that some are even lower than the brute beasts in their habits. Everything good and holy is a subject for ridicule and contempt. For relaxation the only game is poker, which is a good training to turn the young man into a gambler.

Even in the rules that are for his good, he is treated like a child rather than like a responsible man. In case he gets sick, 50 cents a month is taken off his wages to pay the doctor, and he has no say in the matter. To make his cleanly, another 75 cents a month is taken off to pay for his washing, whether he has any done or not. To prevent him making a beast of himself, strict rules prohibit whiskey coming into camp. Thus at every turn the poor lumberjack is shown he is an irresponsible creature not to be treated as a free agent, and when a man is treated so, all history shows he will take delight in asserting his manhood by breaking such laws every chance he gets. If he can do so no other way, he will "jump" about once a month to prove to himself and others that at all events he is not quite a slave.

Evil Tendency of Camp Influences

Here are two young men from the farm. One goes into the city, is surrounded at once by good influences, by church and Y.M.C.A., and while his physical strength may deteriorate, he becomes a morally strong able man, and is one who supplies fibre to the city. His brother goes to the camp because there is more money in it. The influences he is surrounded with, every lumberman knows, and to counteract these, he possibly never sees a missionary from the time he goes in till he comes out. One of two things happen. He either goes with the tide, becomes a drinker and profane, or else he quits the work in disgust, and can't be coaxed to return. In either event this is a loss to the proprietor, who needs just such men as he is.

If he is not from the farm, he may be, as hundreds are, some hearty young immigrant, with a good education and robust health, quite competent to make an expert lumberman in two or three years. (I may say here that I am personally acquainted with one Scotch lad who never had an axe in his hand before coming to the woods, and who, after three seasons, could hold his own making timber with any Canadian.) These men have been used to plenty of reading and entertainment, and the monotony of camp conditions either ruins them or drives them elsewhere.

The consequence is that while in other lines of business the comparatively young man in the prime of life has come to the front to manage large enterprises, the proprietors of lumber camps have to fall back for foremen on men who are not in their prime, but whose experience has been gained by long years in the bush. This is probably also the only line of business in a civilized country where thousands of dollars are sometimes placed in control of men who cannot read or write, and in other cases cannot be trusted to leave camp for fear of their getting on a spree. No wonder that there are frequently heavy losses. We must confess that we are filled with admiration of the executive ability of many of these men, but when they drop off in the course of nature, we see no promising young men coming along to fill their places.

In my opinion, the remedy is to give some attention to the higher nature of the men. You will soon have a better class. The raw material as supplied from the farms and elsewhere is the very best possible, and if it was simply recognized that this side of a man needs attention the results would soon be evident.

Get the Men to Help Themselves

The underlying principle upon which the Shantymen's Christian Association has been organized is that "The only true way to help a man is to get him to help himself." In every other spasmodic effort to help the men in this line, this vital principle has been lost sight of, and consequently they have failed.

In conversing with no less an authority than the Governor-General, Earl Grey, on this subject, the writer was asked, "Will you not frighten the men by using the word Christian?" Our reply was, "No, we are certain we will not." Two years experience since then has confirmed us in the same belief. No matter how low a man has sunk in this land, he does not like to be regarded as a heathen, and therefore the word Christian will be approved by them. Besides, we may frankly state here our conviction that only as religion is the base of an organization will it prove itself a permanent success. Where we have sounded the men themselves we have invariably found their response enthusiastic.

That the Y.M.C.A. principle has not failed is evidenced by the way the business men of Toronto have recognized its usefulness. It is evidenced by the way the railroad companies have encouraged the formation of associations, and given large contributions to them. The police, soldiers, sailors and postmen all have their Christian Associations, and these have been approved and helped by their superiors in office. If you want a better class of shantymen, let them have one also. Any one desiring information can write William Henderson, Burk's Falls, Ont.

B.C. Improving its Forest Service

The Government of British Columbia are taking active steps to improve the forest service in that province. The force for fighting forest fires has been largely augmented as a result of the liberal vote of $75,000 for this purpose which was passed at the recent session of the Legislature. The entire forest defence force is now under the direction of one chief fire warden, Mr. Wynyard C. Gladwin, under whom the province is divided into four divisional districts. The coast and northern districts constitute the first division, which is under the direct control of the chief fire warden. Vancouver Island comprises the second division, and is under the charge of Mr Wm. F. Loveland, of Victoria. Yale-Cariboo and the Okanagan constitute the third district, which is under the charge of Mr. J. K. McLean, with headquarters at Revelstoke. The fourth district is comprised of east and west Kootenay, and Mr. R. J. Long, of Creston is in charge. These men have large and competent staffs of wardens in their employ, and they travel during the season from section to section, assisting in guiding the wardens in their patrol work. The close season for setting out fires for the purpose of clearing land commenced on May 1st, and continues until the end of September. In addition to these safeguards, an arrangement has been made with the Public Works Department whereby all road foremen are appointed as assistant fire wardens and are required whenever danger threntens, to join in the work of fighting fires. The equipment carried by road gangs will be of great utility in the work of fire fighting.

The more I study this subject of private forestry, the more I am convinced that what is needed is not immediate legislation, but an immediate beginning of the practical operation of forestry, and I am convinced that the results of such a beginning will be conclusive evidence that American lumbermen are fully capable of meeting the conservation problem both from the standpoint of the permanent requirements of the lumber trade and from that of the continued prosperity of the public at large.—H. S. Graves, Chief of the U. S. Forest Service.

Lumbermen

Who are critical in their demands always find in our method of selling direct to the regular trade, the close attention to the minutest details so absolutely impossible to secure when buying haphazardly.

To provide for filling all our orders promptly and satisfactorily, we have large and well assorted stocks on hand constantly—a feature that can hardly help pleasing you.

We want to prove to you that we are different from the others in many ways.

A Trial Will Convince You

None but those meaning business need apply. For further particulars apply Box 943, CANADA LUMBERMAN, Toronto 11

The Growth of a White Pine

The State Forester of Vermont recently received from Middlesex, in that State, a cross-section of a white pine 32 inches in diameter and 77 years old, as shown by its rings. From the tree were cut 495 feet.
seven 12-foot logs, measuring 1,-

An analysis of the growth of this pine throws light on the growth of trees in general. Its diameter inside the bark at various ages was as follows: Ten years, 3½ inches; 20 years, 9½ inches; 30 years, 14¼ inches; 40 years, 18¾ inches; 50 years, 22¾ inches; 60 years, 26¼ inches. This shows that the greatest diameter growth was made during the second decade. In fact, during the first 20 years of the tree's life, the rings averaged nearly ½-inch in width. As a matter of fact, however, the production of lumber in a tree is not proportional to the diameter growth, but the growth of the whole cross-section, or the square of the diameter. Now, the cross-section of the base of this tree at various ages was as follows: 10 years, 7-100 of a square foot; 20 years, one-half of a square foot; 30 years, 1 1-10 square feet; 40 years, 1 9-10 square feet; 50 years, 2 8-10 square feet; 60 years, 3¾ square feet; 70 years, 4 6-10 square feet; 77 years, 5¼ square feet. In other words, the growth of the cross-section in the second decade was 4-10 of a square foot; in the third decade, 6-10 of a square foot; in the fourth decade. 8-10; fifth, 9-10; sixth, 95-100; seventh, 85-100; and in the last seven years, 65-100. The rate of the growth of the tree culminated, therefore, between the ages of 50 and 60 years, while a superficial examination of the rings would lead one to think that it reached its maximum growth by the age of 20.

It must also be remembered that in addition to the growth there is a constantly increasing quality increment. Not only do the lower limbs drop off in the early life of a tree grown in the forest, thus making the older lumber clearer; but boards two feet wide are no longer common and are worth more per thousand feet that boards a foot wide. The growth of this particular tree is no doubt largely due to the fact that it happened to have the best amount of light and moisture during the first half-century of its growth. It is probable that had the forest been properly thinned at that time the same growth might have been maintained during the next quarter-century.

Increased Demand for Low Grade Oak

It is probable that the grades of oak below firsts and seconds and No. 1 common hereafter will receive more attention than during the last year. This will be true of the wider cuts, since consumers will be able to work the wider and lower grades more economically than the narrow first and second stuff, for which high prices must be paid. Medium grade furniture manufacturers are finding that they are having to pay too much for good oak for profitable manufacture and are turning to the cheaper grades of lumber as an escape from the dilemma.

From Nashville, Tenn., it is reported that the demand for the lower grades of oak is rising and such lumber is selling in increased volume. In former years cheap oak was a quick seller in all furniture manufacturing centres, both plain and quarter sawed. But for the last two years, or more, high grade stock has had the call, and the lower grades were inclined to accumulate. Now if the cheaper oak can be made to move off with facility it will be a boon to the hardwood mill operators.

French Walnut

The so-called French walnut, a tree which really grows in Persia and Asia Minor, is considered the finest and most costly of all woods. In appearance it is warped and much contorted, and the sole value lies in the large tough excrescences growing on the trunk in the form of burls. These burls, when cut, present a singularly complicated and twisting grain, the intricacy of which, together with the symmetry, is the determining element in fixing values. Color and soundness also enter into the question to a large extent, as trees of this sort are more than liable to be unsound at the heart. A figure of from $500 to $1,000 is not exceptional for a good burl, and one recently sold in Paris, weighing 2,-200 pounds, for $5,000. The producers of burls are apt to resort to dishonest methods in order to get a higher price. Often decay leaves large hollow spaces in the centre, which, if discovered, will, of course, reduce the value. In order to guard against discovery of these hollows as much as possible, they are often filled by fraudulent dealers with weighty substances which closely resemble wood. In this way the burl is brought up to a more normal weight, and the suspicions of the buyer are not aroused. Oftentimes stones and other hard substances are used as fillers, and the innocent purchaser is not aware of the fact until he starts to cut his log, when his valuable veneer knives or saws are completely ruined.

Wood Pulp Market of Norway

There has been a little livelier inquiry for chemical lately, though prices are so far practically unchanged. The delivery on contracts has been quite considerable. Three large mills have balanced their books for 1908; the result is not encouraging. In mechanical, the first half of March shows a good many sales for 1911 and 1912. But prices continue unsatisfactory, considering the cost of production, and the question of a reduced production has been under discussion in the organization for some time. There appears to be a strong disposition towards an agreement of this kind.

Lumber Market in Denmark

The lumber market in Denmark during 1909 was similar to that of 1908. The prices were rather higher during the fall and culminated during December, when considerable business was done. In January of this year, it was more quiet. The importers only covered their immediate wants on account of the high prices asked by the foreign exporters. The prospects for imports during 1910 are fair, so it is thought it will reach the normal.

Palmetto Wood for Furniture

Palmetto trees cover thousands of acres in South America, and hitherto have been considered worthless except for building piers. Experts have been working for years and much money has been spent in seeking to give the trees a commercial value, but their chief value seemed to lie in giving the scenery of which they are a part a picturesque feature. A plan has, however, been adopted for making a commercial hardwood from the fibred trunks of the trees. The wood has artistic grain resembling Mexican onyx, and is being used in the manufacture of furniture.

Mahogany Much Prized

In the past Jamaica mahogany was much prized in the English market, and commanded a higher price than that of Central America on account of its hardness and curly mottled grain. At present the export has dwindled to an amount which is hardly worth mentioning, but in former times a very large amount was exported. Isolated trees are still found of a circumference exceeding 20 feet, but rarely exceed 4 feet in diameter. As timber, the present stock is inferior to the Honduras variety, having neither grain nor toughness, but with age it becomes of a good color, however, and is a handsome wood. It is nowhere found in great quantity.

Bitter Wood Insect Proof

Bitter wood is found to grow to as great a height as 80 feet in Jamaica, with a diameter of 2 feet. The wood is largely exported and forms the "Quassia" of commerce. It is exported for use in beer manufacture and for making drinking cups, which render bitter water left in them. Locally the wood is used for ceilings and furniture, as it is objectionable to insects.

Timbers of Jamaica

The timbers of Jamaica may be summed up for the most part as hardwoods, with a comparatively small number of soft woods, of which only a few possess strength and durability sufficient to bring them into general use.

Review of Current Trade Conditions

Ontario

The hemlock situation in Ontario is much more promising than it has been for some time. A general advance of about $1 a thousand has been made and manufacturers find that the trade are accepting it much better than was anticipated. There is a scarcity of dry hemlock and the cut of hemlock this year is expected to be small, as a result of the difficulty which many of the manufacturers experienced in getting out logs last winter. Other lines are moving steadily. All lines of good lumber are doing well and even the intermediate grades are in fair demand and selling at prices considerably in advance of a year ago. Mill and dead culls, however, are still trailing behind. Lath are very strong, but the shingle situation continues uncertain.

Box lumber has been in fairly good demand at Ottawa during the past fortnight, and an extensive sale of narrow width was made to an American purchaser at a price very nearly as good as the price of a year ago. This is expected to assist materially in reducing stocks of box lumber. All stocks above shipping culls are moving satisfactorily. Prices for the upper grades of white pine are firm, but the movement of lumber is not brisk. Mill cull strips and sidings, 1-inch by 4-inch and up, 12 feet and up, are selling steadily around $15 per M., and box lumber is varying from $12 to $16. The demand for pine deals for the English market is rather dull.

Eastern Canada

The log driving situation is rather less favorable on the St. John, Restigouche and Miramichi rivers than it was a fortnight ago. The waters are rather low and there is much need for a heavy rain. As a result considerable quantities of logs are reported as being held up. The English market for New Brunswick spruce deals is unchanged and dull as a result largely of the succession of political events which have interfered with market conditions and of the interruption to trade which has resulted from the death of King Edward VII. Shipments by liners from St. John during the winter were very heavy and as a result stocks at the opening of the manufacturing season were somewhat light, amounting to about four and a half million feet. Stocks at the Miramichi are light on account of several heavy shipments during the past fortnight. The stocks amount to about three and a half million or four million feet. English spruce deals on the wharf at New Brunswick shipping points are valued at from $14.75 to $15.25 per M. for the usual specifications.

The Boston spruce market is not so firm as it was a fortnight ago. Prices have declined a little and frames are selling at $23.50 to $24, but very few purchasers are paying the top price. It is believed that $23.50 will be the general price for a few weeks. With easier prices, a better demand from the yards is expected. There has only been a slight demand for shingles at Boston, and sales have been at lower figures than formerly. Buyers look for a still further decline. The best cedar extras are ranging from $3.40 to $3.50. The demand for lath is light, 1½-inch selling at $3.50 to $3.60 and 1⅝-inch at $3.80 to $3.85. At New York, the stocks of northern pine are light. Prices are fair but competition is making business very difficult to secure. A large amount of building, however, is in progress and stocks in first hands are quite light, so that increased activity will probably bring higher prices. There is an improvement in the demand for spruce at New York. There is a moderate inquiry only for small sizes in random, and prices are rather easy, the general selling price is $20 but some dealers are asking 50 cents more. The supply of dry spruce boards is small and prices are well maintained.

A Boston correspondent of the "Canada Lumberman" who is in close touch with the situation, writes as follows: "There is not very much change in the way of prices. The general market conditions here have been to a certain extent uncertain and there has been a general feeling that finances were not in the best state possible, as well as a feeling that government interference with large corporations and general government interference with business was likely to make rather dull trade. Still there seems to be a pretty fair volume of trade, and on the whole prices are well maintained with the exception of eastern spruce, dimension timber, etc., which we think is rather weak and shows a sign of further weakening. Also eastern shingles seem to be very weak. We think $3.50 is the maximum price for any ordinary first class shingle and it is pretty hard work to get over $3.40 and $2.90 for extras and clears, even on very nice shingles. To get a higher price takes a very fancy gilt-edge well known brand. There is a feeling here that when Congress adjourns conditions are likely to improve all round. We note a little better trade in the New York market lately for Canadian spruce. We are in receipt to-day of quite a number of orders at a pretty fair price."

Western Canada

Reports from the prairie provinces continue to indicate that the demand for lumber for building purposes will continue strong for some time. A shortage of lumber during the next few months is not unexpected, as the demand during the past six months has been much greater than was anticipated. Stocks generally are considerably broken. Some of the coast mills have been refusing orders for prompt delivery. The output in Saskatchewan will be reduced by 25 per cent. by the early spring, which destroyed the ice roads before the logs were all drawn. Prices at the British Columbia mills are accordingly stiffening and are now from $3 to $5 higher than a year ago. At Winnipeg, prices show an advance within the past few weeks of from 50 cents to $1 per thousand. Winnipeg dealers report that the spring trade has been very brisk, and the demand for lumber is increasing every day. From present prospects, one large manufacturing company state that they expect one of the best years they have ever had in the west, with correspondingly good prices and easy sale of stock. British Columbia manufacturers are seriously hampered by the scarcity of labor.

Great Britain

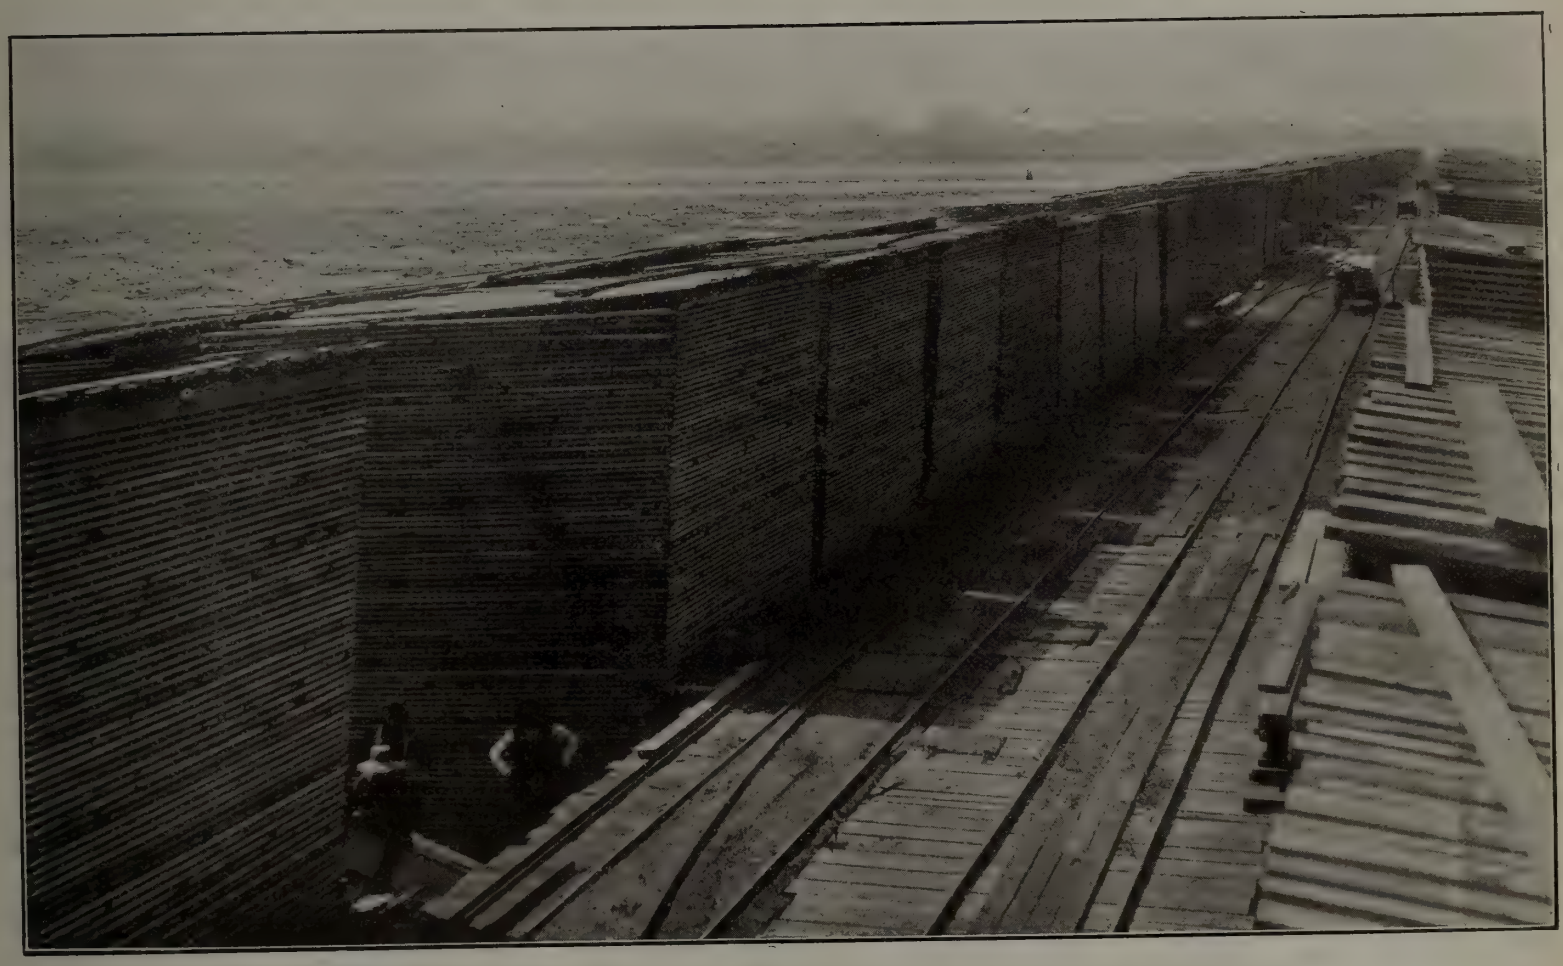
The death of King Edward had a depressing effect upon trade in general, as was to be expected. The lumber trade was no exception. It is noticeable, however, that there is a steady and encouraging trade in progress. At London, the result of the early opening of navigation in many lumber shipping countries is seen in the large overside deliveries at the docks, both in deals and floorings. Prices generally are sailing along on a very even keel with a tendency towards advance, as a result of the large proportion of the production which has already been placed.

At Liverpool, the timber market of late has not been particularly buoyant. Prices, however, have been pretty well maintained. Spruce deals are still selling at £8 5s. per standard c.i.f. Stocks are mainly short lengths, in 3 x 9 and 3 x 11-inch, and a rather larger proportion of 3 x 10-inch than usual. 3 x 7 and 8-inch are also more plentiful than a couple of months ago, ranging from 11 to 17 feet in length. 2½ x 7 are in good demand, especially in Manchester district. 3-inch scantlings are somewhat scarce, but 2 x 4 and 6-inch are plentiful. There is a good demand for birch planks c.i.f., and the tendency is towards a stiffening of prices. The spot market is rather slow. In fact, planks ex-stock are being sold at less than importers are asking for goods on the quay. The demand is only moderate and is confined to the favorite thicknesses. The demand for birch logs has fallen off somewhat but the import is not heavy. Stocks are light and prices firm. Quebec pine is much steadier, especially for the better qualities. Second quality goods in all sizes are also in better demand and stocks are somewhat short. There is a steady demand for thirds and prices are firm, but fourths are a little easier. Red pine continues firm with an improvement in the demand.

At Manchester there is a general tendency to believe that the cotton dispute is nearly settled. Prices are firm in the lumber market but there is no great haste about purchasing. Arrivals of spruce have been plentiful but business is somewhat dull. Floorings are firm at £10 2s. 6d., basis c.i.f. Arrivals of wood goods generally have not been heavy. It is felt that the season has been commenced strongly, as the quantity of timber moving from the quays is much greater than the average for this time of year. It looks also as if this state of affairs will continue for some time.

At Glasgow, the business during the past fortnight has only been moderate. Supplies of pine and spruce are small and prices are quite firm. Buyers, however, are somewhat diffident, as they hope to secure more favorable prices later on. It is not expected that pine prices will be any easier. Spruce, however, does not look quite so firm.

United States



The customary decrease in the volume of the lumber trade throughout the United States at this time of year has been making itself felt during the past fortnight. On account of the early spring, dulness has come a little earlier than usual. The trade in northern pine at Chicago is somewhat quiet, largely on account of the fact that farmers are busy with their crops. There is no important change in the hardwood situation at Chicago, orders coming along quite regularly. Prices are well maintained, though the volume of trade is not so great as wholesalers would desire. A slight advance in hemlock has been put into effect at Chicago and looks as though it will be maintained. Fir, spruce and cedar are moving fairly well, with an upward tendency. Southern pine is still dull. Very few orders are being placed for Washington shingles or lath. Quite 65 per cent. of the Washington mills are still closed.

At Buffalo, there is a fair demand for northern pine and prices are firm. As usual the higher grades are much better sellers and the low grades are too plentiful. The hardwood trade is quiet. There is a firm demand for oak and also for birch and chestnut. There is no noticeable deterioration in the trade generally and an improvement is rather to be looked for. Black ash is active. There is a moderate demand for white ash and the supply is not large. Hemlock is moving quite actively and prices are well maintained. Shingles are more active and an effort is being made by some of the dealers to advance the price to $2.60 for red

The Cleveland-Sarnia Saw Mills Co., Limited

Why Not Have the Best?

To hold the confidence of your trade you must be able to back up all your statements with the goods, and that's where we can help you out. When you want anything in White Pine, Norway or Fir—and want it right—let us have your order. We can furnish any length from ten to sixty feet.

If there is anything on earth we pride ourselves upon, its the prompt way in which we fill orders.

Cleveland-Sarnia Saw Mills Co., Limited

SARNIA, ONTARIO

cedar clears. The closing of the Pacific coast mills has not yet stiffened the price.

There is a moderate inquiry for staves and heading at Chicago and shipments are light. Flour mills are not buying many barrels and coopers are finding it difficult to keep their men employed. The tight barrel trade is also rather quiet, although the price for staves at present is very little higher than for common oak lumber.

Market Correspondence

Box Lumber Selling Well at Ottawa

Ottawa, May 25—An important sale of narrow width box lumber has been made by a leading Ottawa valley manufacturer to an American buyer at a very small reduction on last year's prices. By this transaction the local mill has got rid of a lot of old stock which to some extent had burdened the market, and the order is big enough to take all the narrow box lumber he will cut this season. Manufacturers have no anxiety about disposing of stocks above the shipping cull class. Consequently, this and other recent sales of box and mill culls have given more encouraging outlook to the trade in low grade lumber, compared with conditions during the early part of May. Prices are firm in the upper grades of pine, and mill owners have confidence in the season's prospects. Still the movement of lumber is not brisk. There has been a falling off in demand in both Montreal and the New York markets compared with the trade of April. A representative dealer explains that any falling off in buying would quickly come to an end if a final settlement was reached between Canada and the United States in tariff matters. With a modification of the existing duty on lumber proposed, American buyers seem inclined to wait till something definite is known. The duty of $1.25 per thousand is understood to be baffling orders for box and mill culls. Any marked increase in demand for these would soon clean up the stock in the Ottawa valley. While there is a large variety of the low grade stock no single line is large. Mill cull strips and sidings, 1-inch by 4 and up, 12 feet and up, are firm around $15 per M. Box lumber runs from $12 to $16 according to sorting.

A large number of American barges have been chartered by Ottawa valley exporters to deliver lumber at United States points. They are expected about the first of June. Complaints are numerous about car shortage. Orders have been delayed for some days. They are usually such that they cannot be delivered by water route or shippers would turn to barge transportation. If the car shortage were to continue for any considerable length of time some shipments would be diverted to the canals that would otherwise be carried by rail.

The loading of deal for the English market is going on at the same rate as last year. The demand is slack compared with four or five years ago when at this time of year green deal would be taken direct from the mill to the wharf instead of being piled in the yards. The first of this year's cut of higher grades of deal will not be removed until about the middle of July.

Transportation on the Rideau canal was obstructed by a washout at Hog's Back on May 16th, and boats had to make a circuitous route to reach Ottawa from the St. Lawrence. Lumber shipments to Kingston were delayed somewhat. The river overflowed its banks at Eastview and relief had to be sought by removing the stop logs at the W. C. Edwards Company mill in New Edinburgh.

The Ottawa river is only nine feet deep at the foot of the Rideau canal, as compared with 24 feet at this time last year and the year before. The outlook for navigation is not comparatively bad, for usually high water at this time of the year means a waste which will be needed later on. The logs are coming down at the usual pace and some of the smaller mills are waiting for a supply. The quantity which remained over from last season, however, insures the big manufacturers enough to keep their mills going. Between Pembroke and Ottawa it is estimated that there are as many logs as the boom company can put through in one season. J. R. Booth is drawing gradually on the logs hauled by train during the winter and piled on the ice above the mill. It was the intention to let them season a while longer, but the wind drives them out of the storing place and they have to be handled. J. R. Booth has 300,000 pieces of pine and pulp wood entering the Ottawa river from the Montreal river. This large consignment is the output of three camps. Mr. Booth's cut of spruce timber is on the increase yearly owing to the expansion of his paper plants. In order to keep up the supply of pulp he is completing a new mill which will be run when enough water power is available. Fraser & Company, Deschenes, are cutting entirely for Shepard & Morse Company.

McLachlin Bros., of Arnprior, made an increase of ten cents a day in the wages of their employees. The change will affect 500 or 600 men and will add about $10,000 to the cost of the summer's operations. Inquiry of Mr. J. Fred Booth as to the pay of sawmill hands in general, elicited the information that $1.50 a day was the minimum, the same as last year. This applies to drivers of single horses and unskilled hands mill for a majority of the hands runs from $10.50 to $14 per week. Sawyers and large circular saw hands and a few others are paid $2 or $3 more than this. These rates have been current for the last few years of various kinds. The Booth pay roll shows, however, that wages in the and the labor situation was never in a more satisfactory position than at present. A slight boom was given to wages in Arnprior by the hiring of sawmill hands for the Ross Saskatoon Lumber Company, of Waldo, B.C. From $2.75 and up was offered, and some 60 young men went away.

The lumbermen of the Ottawa valley were considering closing down on May 20th in observance of the funeral of King Edward VII., when the intimation was given by His Excellency Earl Grey, that if they followed the example of the C.P.R. and suspended operations for three minutes at a fixed time of the day the purpose of recognizing the obsequies of the deceased King would be properly served. This course was adopted also at the request of the mill hands, who preferred not to lose the day. The whistles of the E. B. Eddy Company, W. C. Edwards Company, Library Bureau and Gow & Bayliss mills, situated in four localities remote from each other, were blown at 1.30. This was the signal for not only the lumber establishments, but all mills and factories, to suspend activity for three minutes. Loads of lumber throughout the city were halted at the signal and men everywhere paused till the whistles again gave the token that work might begin.

George H. Perley, M.P., head of the Perley Lumber Company, with mills at Calumet and other points, has been appointed outside whip of the Conservative party. The office is a new one. Mr. Perley will look after the interests of the party from Ottawa.

H. I. Flynn, of Hull, has purchased a timber limit on the Gatineau consisting of 300 acres, from J. B. Cousolles, for $10,000. The purchase includes a mill and water power at Red Chute.

Fraser, Bryson Lumber Company, Limited, wholesale lumber dealers, Ottawa, have recently removed to more commodious offices in the Castle Building, 53 Queen street.

Driving Conditions in New Brunswick Less Favorable

Chatham, N.B., May 24—Conditions in regard to the log driving on the rivers of New Brunswick are not nearly so favorable as was the case at last writing a fortnight ago. The water in the streams has fallen off with much greater rapidity than was expected and it is now known that some large and important quantities of logs will be hung up on the St. John and the Restigouche. A drive owned by the Shives Lumber Company, of Campbellton, and consisting of 2,000,000 feet, is hung. Another drive of 4,000,000 feet, owned by different parties, is also hung. If the situation grows no worse the hang-up of these quantities will not seriously curtail the manufacturing season at any of the mills on the Restigouche, as it seems at present writing that beyond those mentioned no important quantities will be caught.

The water in the St. John river has also fallen rapidly and conditions are causing some anxiety for the drives. The river is now very low for this time of year. Several large drives are already hung and the crews which were bringing them out have, in some cases, left them to be brought out in the fall or next spring. There is a hang-up of about 10,000,000 feet at Black River Rapids. This is owned by St. John and Fredericton manufacturers. Beyond this hang-up, reports are fairly favorable, although growing less so day by day. Rain is badly needed and several driving crews are staying by their drives in the hope that it will come.

On the Miramichi the driving is very arduous, but so far the total hang-up could not be correctly figured at more than 500,000 feet. Conditions on the Miramichi are somewhat similar to those on the St. John and on the Restigouche; the water is falling but considerable progress has already been made with the drives. A heavy rain and its attendant rise of water would, however, relieve the situation and ensure (what is now by no means too certain) a supply of logs great enough to ensure a full manufacturing season.

The English market for New Brunswick spruce deals, always the most important feature to New Brunswick lumber manufacturers and dealers, has, judging from local and provincial indications, shown no remarkable changes for some weeks past. At the chief buying and manufacturing centres of this province the trade in this line has one characteristic which stands out, that of monotony. The English market, it is stated by those in thorough touch with conditions on the other side, has been subjected to a long series of unfavorable conditions, and it is generally felt that, no matter what other conditions existed in regard to supply or other usually vital elements, the situation would perhaps be little different from that which exists at present. Following a partial recovery from the slump of three years ago, the elections came on; after the elections, the crisis in the House of Commons and House of Lords caused a continuation of conditions which could not but be unfavorable to business. The death of the King has added to the general unsettled condition of the affairs of the nation, and the effect of all is felt in all lines of business. As usual, the lumber trade was the first to feel the influence and, while values have not suffered to any extent, the brightening

of demand and betterment of trade in "English" spruce deals is slow in coming, although it was confidently expected by Canadian manufacturers and dealers that this spring would bring these more favorable conditions.

In regard to supply, a review of the situation would lead to the conclusion that available quantities of "English" spruce deals are fairly light throughout the province—at some points decidedly so. From St. John the shipments by the liners during the winter were very heavy and the opening of the manufacturing season finds stocks somewhat depleted. From four and one-half to five millions of feet would cover the aggregate. At the Miramichi, stocks are about as usual or somewhat lighter than is usual at this season of the year. Several heavy shipments have been made during the past fortnight and all that is now available for market purposes would be a quantity of from three and one-half to four and one-half millions of feet.

The present value of English spruce deals on the wharf at shipping points in New Brunswick, on the usual specification, 50 per cent. sevens and eights, 35 per cent. nines, and balance elevens and up, would be from $14.75 to $15.25 per thousand superficial feet.

Owen Sound and Wiarton Mills are Busy

That lumber trade conditions in the Georgian Bay district are brisk and encouraging was evidenced on all sides, when a representative of the "Canada Lumberman" recently called upon a number of the companies. At Owen Sound, interviews were had with the principel lumber merchants and mill owners, all of whom were unanimous in the one remark, "Business is good." One has only to take a casual glance around the town to be made aware of the fact that Owen Sound is an important lumber centre. Every mill was busy in operation; every lumber yard gave evidence of extensive sales and frequent purchase of fresh stocks to bear out the assertion that business had been brisk during the spring. A factor that has impeded lumber operations somewhat in the past at Owen Sound was that no arrangements could be made between the C.P.R. and G.T.R. regarding the handling of lumber by the two railways. It is now learned on good authority that negotiations are progressing between the two railways, and there is a good prospect that in the near future satisfactory interswitching arrangements will be made. This will prove a great advantage to local lumber dealers.

The Edward Hines Lumber Company, which is a branch of the extensive United States lumber concern of the same name, are confident as to trade conditions this year. Mr. Hartingh, the manager, states that last year this branch handled almost 1,500,000 feet of lumber. Over two-thirds of their output is disposed of in Ontario, not being shipped across border as generally supposed.

The Owen Sound Lumber Company state they have three times as much stock bought now as compared with this time last year, and the outlook for the future is very bright.

Keenan Bros. are among the largest lumber consumers in the Owen Sound district. They are at present operating three sawmills, one at Miller lake, one at Maxwell, and one at Owen Sound. They have also several auxiliary factories in Owen Sound, one turning out woodenware and another folding boxes.

Another busy lumberman in Owen Sound is Mr. J. S. Findlay, who has for some time past been operating a sawmill at this point. He is closing down the sawmill and going exclusively into the wholesale lumber business, making a specialty of export trade.

The Rixson, Ainsley & Stoddart Lumber Company also conduct a large business at this point. They have several sawmills in the northern country and also are large dealers in all kinds of lumber.

The McDonald-Rowland Company are also important lumber dealers. Beside other woods, the firm handle a large amount of basswood, and altogether over 3,000,000 feet was handled by them during the past year. They are at present contemplating the erection of a mill in the southern States so that they may be in a position to supply their customers with the first quality of hardwood from southern lumber centres.

Among the many large consumers of lumber at Owen Sound none are better known than John Harrison & Company, manufacturers of all kinds of lumber, interior finish, sashes, doors, etc. They have been long established, and year by year a steadily increasing business has testified to the excellent quality of the material turned out.

Owen Sound is undoubtedly one of the most important lumber centres in the Georgian Bay district, and a safe estimate of the amount of lumber consumed there within a year would be 50,000,000 feet.

Another important lumber centre in this district is Wiarton. Many sawmills line the shores of the Georgian bay at this point, and in the town of Wiarton there are five large mills working overtime to meet the demand. A few complaints are heard this season regarding the scarcity of logs and firms which were not fortunate enough to secure a full supply earlier in the season are now finding it difficult to procure them.

Wiarton also possesses among its industries several firms which are large consumers of lumber. Siemon Bros. are very large manufacturers of hardwood flooring, and are at present building a new factory at this point, which will greatly increase their facilities.

SAW.
TORONTO.

Extract from Letter received from Eastern Canada

GENTLEMEN :—

We received your No. 2½ Chisel Tooth Saw and have tested it very thoroughly and are pleased to write that it is the most perfect saw we have ever had. The tension is the finest. It is the only saw we have ever had to stand up and do good work with the heavy feed we carry.

We are sending you saws of another make and would ask you to hammer them the same as the one you sent us.

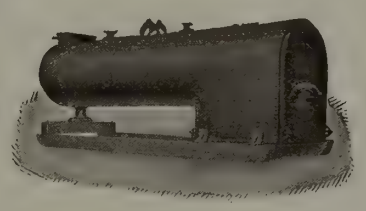
When we need new Saws, you get the order.

This was a Burns No. 2½ Chisel Tooth Saw giving satisfaction under very heavy feed

Tubular Boilers

Horizontal Tubular Boilers in all sizes from 10 to 250 H.P. for medium or high pressure.

High Pressure Tubular Boilers from 80 to 250 H.P. our specialty.



Vertical Boilers in all sizes from 4 to 60 H.P.

Locomotive Type Boilers from 25 to 100 H.P.

Larger sizes built to order.

Write for our new Boiler Catalogue.

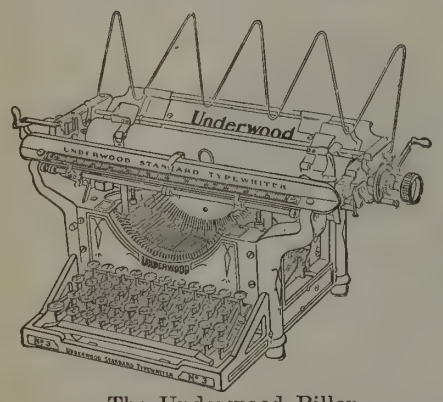
The Shimer Cutter Head

IS DESIGNED FOR A PURPOSE



Which has for its object the direct saving of labor and material. Its construction agrees with the special class of work it is to perform. It is first made to suit the machine—it is next made to suit the work. Every detail is carefully formed to give a free cut—to hold a uniform shape—to be durable. These features establish a permanent make-ready, which demonstrates that this "Best of all Cutter Head" makes a safe and profitable investment.

It works single tongue and groove Flooring, Ceiling, Siding, Ship-Lap and Jointing.
It works Door and Sash Mouldings and Coping to match
It works special shapes of Mould, and is particularly useful in cuttiug Patterns wherein square-off sets occur.

The dealer who accepts your order for the Shimer Cutter Head and supplies you with another means to deceive you in no small matter. Look for the Name and Trade Mark "The Shimer Cutter Head" stamped on every genuine tool. Any other is spurious—sendit back—demand the genuine, of quality and helpfulness, with a record of 40 years of upbuilding and improvement. It costs no more.

EDGINGS

Ontario

Leslie Bros., Mount Forest, Ont., whose mill was recently destroyed by fire, have not as yet adopted any plans for rebuilding.

The Thunder Bay Lumber Company have started cutting logs at the new mill they erected last fall and winter at Thunder Bay, Ont.

O'Neil's planing mill, shingle mill, etc., at Kenilworth, Ont., were destroyed by an explosion on May 16th. The total estimated loss was $20,000.

Mr. D. Gillespie has completed the building of his new factory at Parry Sound and installed machinery for the manufacture of dressed lumber, flooring, siding, sash, doors, mouldings of all kinds, etc.

The Belding Lumber Company, Limited, Toronto, Ont., capital $40,000, have been incorporated. The incorporators are John Cowan, student-at-law, and Thos. W. Best, traveller, both of Toronto, Ont.

Early in May there was considerable danger of forest fires in northern Ontario, on account of a rather long-continued period of dry weather. The rains of the latter end of May, however, have eliminated the danger.

The latest merger now under way is a $30,000,000 combine to embrace the principal tannery firms in Ontario and Quebec. The deal is being arranged in Montreal and Toronto, and the names at present are withheld.

The Swanson Bay Forests Wood Pulp & Lumber Mills, Limited, Ottawa, Ont., capital $1,500,000, have been incorporated. The incorporators are Geo. D. Kelley, barrister, and Joseph Connolly, law clerk, both of Ottawa, Ont.

Forest fires destroyed many million feet of timber in western Ontario and northeastern Minnesota during the second third weeks of May. It is said that the loss to timber owners and farmers exceeds that of any previous series of fires in that district.

Forty-five lumbermen left Arnprior, Ont., recently for Waldo, B.C., where they have been engaged by the Ross Saskatoon Lumber Company. Mr. Dan Currie, formerly of Arnprior, now of Waldo, engaged the party. Wages vary from $2.75 per day up to $12.

Mr. John Mickler, of Collingwood, Ont., who has been with the Graves & Bigwood Company at Byng Inlet for the past seven years, has been appointed superintendent of the Kent-Cooper Company's mill at Collingwood. The company have a large quantity of logs to cut.

Shurly, Dietrich Company, Limited, Galt, Ont., capital $350,000, have secured incorporation to manufacture, sell and deal in saws, mechanics' tools, machinery, etc. The incorporators are Jerome C. Dietrich, manufacturer, and John Turnbull, machinist, both of Galt, Ont.

River drivers report that they are getting on well with their logs both in the Parry Sound and Muskoka districts, and at the rate they are going expect to get through in good time. All the mills are running full time except the one at French River, which has not opened up this season.

It is reported that the Riordon Paper Mills, of Merritton, Ont., will shortly build a large pulp mill there. The company has at present a pulp mill in conjunction with its Merritton plant, but the structure to be built will be much larger than the present one. Plans for the new building are now almost completed, it is said.

The largest stick of timber that has ever went through the Welland Canal aboard a boat was a stick of rock elm, 22 x 20 inches in dimension, which reached St. Catharines, Ont., recently. The stick is 65 feet in length. The barge "Ceylon" which carried it, had a large cargo of elm of the same quality, the entire load being 900 tons in weight, was consigned to Europe, and will be unloaded and trans-shipped when the "Ceylon" reaches Montreal. The timber was loaded at Fairport, Mich.

A public meeting of the citizens and ratepayers of Trenton, Ont., was held recently to discuss a proposition of Toronto capitalists to purchase the Gilmour door plant from the present owners, the Canadian Bank of Commerce. The company proposes, it is understood, to invest $75,000 and give employment to from 75 to 200 men, and ask the council to give it a fixed assessment of $10,000 and a guarantee of bonds for $50,000, giving a first mortgage on the plant as security. The meeting was addressed by Mr. H. M. Lichley, Toronto.

Eastern Provinces

The Dominion Pacific Lumber Company has been formed, with a capital of $3,500,000, and headquarters at Montreal.

It is reported that the East Templeton Lumber Company have sold their mills at East Templeton to an American concern.

David J. Buckley, of Rogersville, N.B., is building a steam rotary sawmill on French Fort Cove, just across from Newcastle. Its dimensions are 110 x 30 feet, two storeys high.

The Dominion Box & Package Company, Limited, Montreal, Que.; capital $700,000, have been incorporated. The incorporators are Robert C. McMichael and Rennie O. McMurtry, advocates, Montreal, Que.

The Dominion Pacific Lumber Company, Limited, Montreal, Que., capital $3,500,000, have been incorporated. The incorporators are Henry A. Lovett, K.C., and Geo. V. Cousins, accountant, both of Montreal, Que.

Ground has been broken at East Angus, Que., for a new pulp mill to be erected by the Brompton Pulp & Paper Company. A 36-foot head is obtainable and it is expected that 2,000 horse-power will be developed. The new mill will be completed this summer.

The following tenders for the supply of lumber for the city of Halifax for 1910-1911 were recently received: Rhodes, Curry & Company, $1,370.96; J. McInnes & Sons, $1,361.43; Brookfield Bros., $1,342.17. The latter was recommended by the board for acceptance.

Several lumber piles in the yards of the Shepard & Morse Lumber Company were destroyed by fire which broke out about 1 a.m. on May 24th. The loss will amount to a few thousand dollars. It required a brave fight on the part of the fire brigade to save the large stock of seasoned lumber piled in the yard. This is the second fire in the yard this summer.

Plans are under way in Montreal for the formation of a company, to be known as the Pacific Pulp & Power Company. The company will be interested in the pulp and power industries of Prince Rupert. A syndicate has been

formed by Mr. A. Scott Ives and subscriptions of about $300,000 have been almost completed. The subscribers include a number of the leading hydraulic and lumber men of the eastern provinces.

The Trois Pistoles Pulp & Lumber Company, of Trois Pistoles, Que., located about 20 miles east of River du Loup, on the Intercolonial Railroad, has a full cut of logs coming down the river for its two large mills located on the Trois Pistoles river near where that river empties into the St. Lawrence. During the regular shut down for the winter months the lower mill has been thoroughly overhauled, and will be ready for a full season's run when the logs reach the mill, about June 1. These plants are under the management of J. E. Tobin, a nephew of E. W. Tobin, of Bromptonville, who is the president of the company. The product of these mills is shipped largely to the United States. E. W. Tobin is now at Bromptonville following a very busy season of Parliament, which adjourned two weeks ago.

Western Canada

Stevens' cooperage works in Elmwood, Man., were destroyed by fire recently. The loss was about $10,000. The owner of the property is Mr. E. L. Drewry.

The Phillips Arm Timber Holding Company, an extra provincial company, has been registered in British Columbia. Its head office is at Seattle, Wash., and the capital is $225,000.

It is reported that the Barclay Sound Cedar Company, which owns extensive limits on the west coast of Vancouver Island, will shortly build a large mill at Port Alberni. The company have made extensive real estate purchases at that point.

The negotiations for the sale of the W. F. Huntting Lumber Company's mill site at Vancouver have been completed and the sale has been put through at the price of $235,000. The mills on this site were destroyed by fire some six months ago. The W. F. Huntting Company have not yet decided what they will do about building elsewhere.

During the month of April 466 licenses were issued for timber holdings west of the Cascades, the fees therefrom aggregating $65,240: east of the Cascades the licenses issued numbered 226, the accruing fees totalling $26.055. Transfer fees in the amount of $340 were collected during the month, with penalties of $1,850, and miscellaneous receipts of $1,338.84.

Messrs. John Arbuthnot, J. M. Savage, J. C. McGavin and H. G. S. Heisterman, of Victoria, B.C., have sold out their interests in the Red Fir Lumber Company, Limited, to a New York syndicate. Mr. George W. Hartzell, of Dayton, Ohio, will eventually take over the management. Mr. T. A. Smith for the present will have charge of the details of operation as formerly.

A deal involving the expenditure of over $1,500,000, the transfer of some 54,000 acres of timber land, the construction of 23 miles of railway and the erection of a large export sawmill on the east coast of Vancouver Island, is stated to have been concluded. The parties interested are the E. & N. Railway Company and the American Finance Company, of New York. The timber lands are tributary to Cowichan Lake.

The Red Fir Lumber Company, Nanaimo, B.C., in addition to the improvements noted in a recent issue of the "Canada Lumberman," have installed a new set of trimmers in the planing mill and a number of new dry sheds. They are also compounding their present engine and increasing their power about 35 per cent. thereby. The company have now three dry kilns 20 x 110 feet, making a holding capacity of 150,000 feet.

T. A. Burrows' large sawmill at Grandview, Man., which was to start the season's cut on May 16th, was burned to the ground on May 11th. It is supposed that sparks from the emery wheel started the fire. The loss on the mill is about $50.000, which is about half covered by insurance. Mr. Burrows has a further loss in that he has about 10.000,000 feet of logs in the river ready to cut. He is already working on plans for rebuilding.

For the fiscal year ending March 31st, according to the report of Crown Timber Agent Leamy, 116,035,422 feet, board measure of standing timber was cut under license in the Dominion railway belt in British Columbia. The total revenue of the office for the year amounted to $123,763.69. Both the amount of timber cut and the revenue obtained through licenses for this period is fully twice as large as that of last year, when it totalled 53,923,157 feet. All records in this line have been broken.

It is reported that large car building shops will be established by the Canadian Northern Railway Company on the Fraser River at Port Mann, opposite the mills of the Fraser River Lumber Company, from which the supply of raw material will be drawn. The Canadian Northern has been buying its passenger and freight cars from independent manufacturers, having no shops of its own. Now that the railway is to enter British Columbia it is asserted that it plans to build its cars on this coast where the requisite timber is so plentiful.

The Timberland Lumber Company, Limited, New Westminster, B.C., have completed the construction of a mill on the Chilliwack line of the B. C. Electric Railway, about six miles from New Westminster. The capacity of the mill is 40,000 to 50,000 feet per day. They will manufacture fir, cedar, and spruce lumber. They are also building dry kilns and putting in planing machines to turn out any size of dressed lumber. They expect to do a good local business and their surplus will probably go to interior points where demand is heavy. The company have several years' cutting on their present limits.

Two thousand men will be taken to the interior of British Columbia by mountain lumbermen from the timber districts of Ontario, Quebec and New Brunswick this summer. Their families will come later and all are expected to become permanent residents of the Kootenay. This was decided upon at an important conference held recently at Fernie. Five hundred of the men were expected within 30 days, and the rest will be brought out as soon as they can be gathered. It is thought that the project will be continued and that within the next few years at least 5,000 men will be brought out under lumbermen's auspices.

W. E. Nelson and F. P. Barber, of Minneapolis, are making a trip through western Canada in the interests of the B. F. Nelson Paper Company, of Minneapolis, to select locations for a number of branches of a large central warehouse that will be established in Winnipeg within the next month. The warehouse will be followed by a factory and the B. F. Nelson Company is shaping its course to enter the field of western Canadian trade and manufacture in a large way. The company is an old established firm in Minneapolis, where it does a large business in the manufacture and sale of roofing and building paper. When the arrangements are completed, Mr. Barber will act as Canadian manager for the company.

For Sale to Close an Account
Crown Granted Timber Limits and Lands

in the

Province of British Columbia, Canada

The undersigned has received instructions from the owners who desire to close the account, to sell by private treaty

Forty Timber Limits and Lands

situate in the Salmon River Valley, West Kootenay, British Columbia, from thirty to forty-five miles north of the United States border, and upon, or contiguous to the Nelson and Fort Sheppard Railway which runs between Spokane, Washington, and Nelson, British Columbia, connecting with the Great Northern and Canadian Pacific Railways, and affording access to the United States and Canadian markets.

The limits contain in the aggregate thirty-eight thousand acres, and are comprised of bottom lands and benches of hills, constituting one of the best bodies of timber in the Central Southern part of British Columbia. Subdivision of the tract has hitherto been consistently refused. Individual limits contain from two hundred and fifty to twenty-one hundred acres, with from three million to forty-five million feet of Cedar, Pine, Hemlock and other woods of excellent quality upon them, in addition to large quantities of Cedar Poles—prices run from $5,000 up according to Stumpage and Location.

Some of the limits are essentially Cedar Pole Propositions, and contain large quantities of the very best quality of Cedar Poles from twenty-five to seventy-five feet in length, free of limbs.

The properties are Crown Granted, and the timber upon them may be exported. The Timber is subject to a Royalty of fifty cents per thousand feet, when cut.

A considerable quantity of the land is available for fruit land when cleared, and the owners are prepared to give a deed of land and timber, or a license to cut timber only for a term of years, at the option of the Purchaser.

TERMS OF SALE:

In order to close the account, very easy terms of purchase will be given, namely, twenty-five per cent. cash, and the balance in four equal annual instalments, and twenty per cent. cash with balance in six equal annual instalments—interest at six per cent.—with operating privileges which will assist purchasers to pay for limits out of stumpage.

The character of the properties together with the easy terms of payment present a unique opportunity to persons of moderate means to acquire valuable limits for either operation or investment.

Prices and further information may be had upon application.

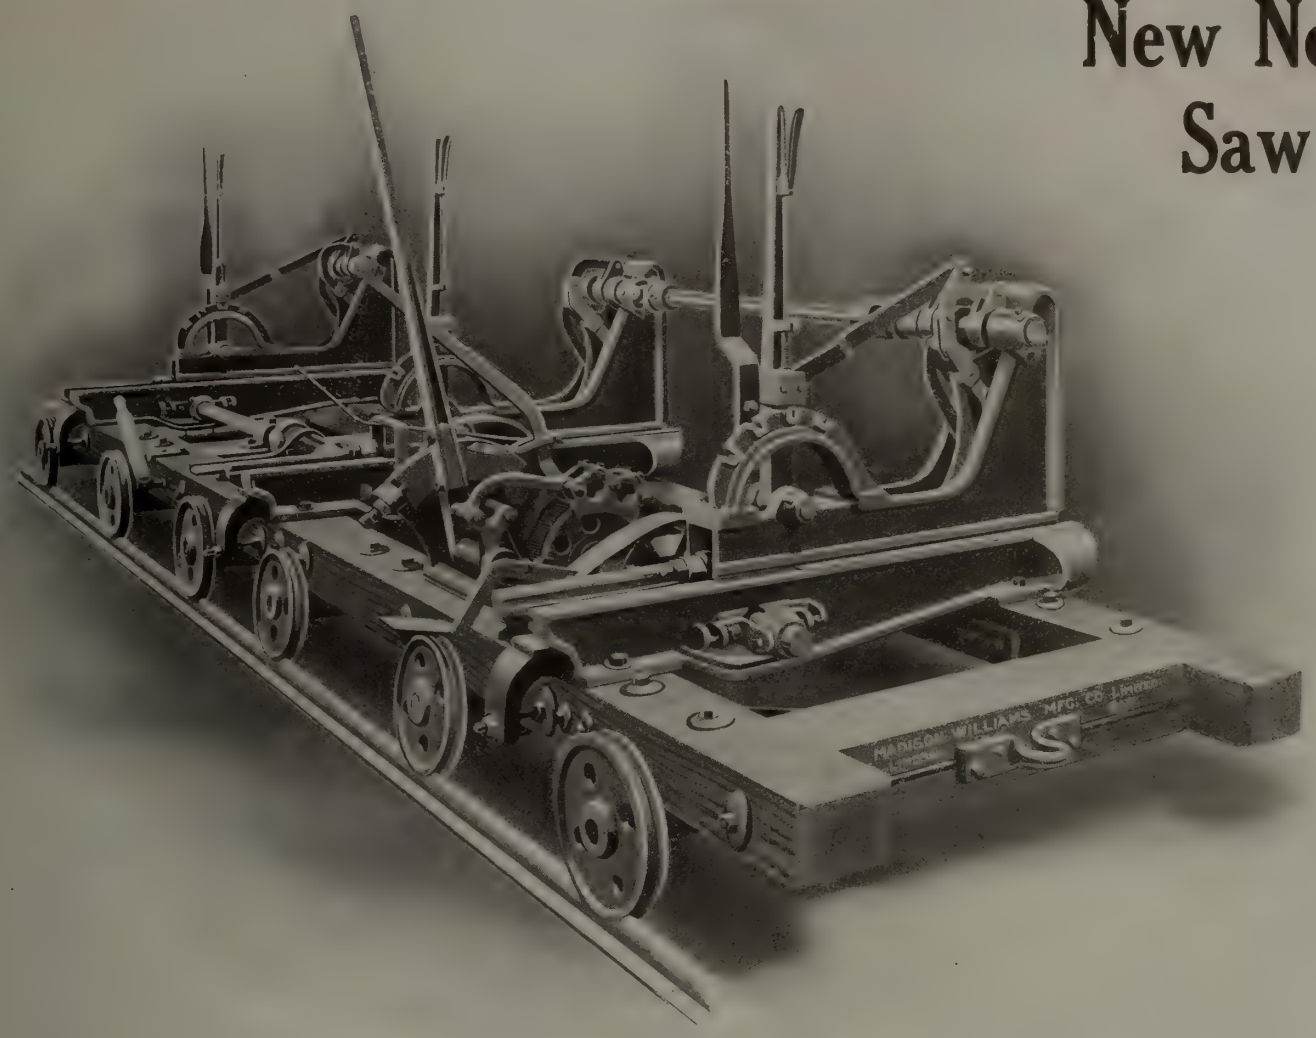
Cheapen Your Logging

By Using the

Lidgerwood Skidding Method

The machine shown in the cut above will pull itself on snow or bare ground wherever a pair of horses could take a drag sled, dray, jumper, skidding or single sled. From any location alongside such a road it will reach to the stump a distance of one-quarter mile or less in every direction and will skid all trees in full length or in log lengths. It will place the logs on skids or sleds or in the stream or lake as desired. It will re-yard logs, either taking the logs direct from the teams or from the skidway, or where left by itself at a previous setting. It operates throughout the year and is absolutely independent of ground conditions; that is, such as windfalls, underbrush, rocks, cliffs, ravines, or the steepest slopes, operating under such conditions almost as cheaply as over smooth ground.

All swamping, rolling, sliding and expensive cant dog or other hand work is eliminated. It does not fill the logs full of gravel and it does not break or otherwise damage them.



It requires a skidding crew of eight men, uses for fuel one and one-half cords of wood per day. It will skid the largest tree or a cord of pulpwood, or several small logs at each trip. It will clear 40 to 60 acres at each setting, moves itself quickly from setting to setting, operates independent of weather conditions, does not "eat" when not working, does not have to be "sprung out" and has a working life of fifteen years.

RESULTS ARE WHAT COUNT

A Combined Skidding and Loading Machine that will clear up the largest area at a setting and can be moved and set up in the shortest possible time will get the best results.

The latest Russel machine has some distinct features that save time and trouble, consequently money. Note the new method of suspending skidding sheaves. They are hung from a vertically hinged jib or triangle, the outer end of which is guyed by two lines one on each side, which are power-tightened and can be set while skidding lines are going out. The guy lines lead back so hey do not interfere with skidding or loading. The uppermost leg of he jib has a spring connection to the tower, reducing shocks. All

skidding strains are absorbed by the guy lines. The swinging boom is operated by wire ropes passing through sheaves suspended from a steel frame projecting from tower and leading to two drums on loading engine, controlled by one lever. Machine is raised or lowered by hydraulic or patented gear jacks. Built for 2 or 4 lines, with stiff or swinging boom, constructed entirely of steel, except loading boom. Is without question the strongest and fastest machine of the day.

MANUFACTURERS OF QUALITY LUMBER AND SHINGLES

A Bald Statement

What's the use of Cutting?

If you are handling "Quality" Stock—it will sell on it's merits, seeing is believing and for your customer to see nice bright dry stock, well graded, smoothly and cleanly dressed, will sell the stock quicker than hours of talk and without "cutting."

If you are interested in building a business along "Quality" lines, or have built your business along "Quality" lines, **we are your people,** we are interested with and for you. If you don't know this it's high time you did. How about it? When it comes to White Pine, (Tonawanda grades,) Quebec Spruce, N. B. Cedar Shingles, Spruce and Pine Lath,—all the best that can be produced—furnished in either straight or mixed cars—**We are it.**

Hanchett Band Swage

Filers! Mill Men!

Success in lumbering depends upon the extra large cuts over the regular cuts, and turning out better lumber. In other words it is turning out more lumber at a less cost. Now our specialty is labor saving machinery for the care of saws. We manufacture all kinds of machinery and tools for the care of saws. One of our best tools is our Hanchett Swage. This tool presses the tooth widest on face, widest at extreme corners, and tapers the tooth downward and backward. Our swage shaper then presses the tooth to an ideal shape and each tooth exactly alike thus doing away with a great deal of filing and making a stronger and better cutting tooth.

Berlin Quality Counts

What We Offer in a "Utility" Resaw

Several years ago we became interested in the future of the Band Saw business and, after having studied the field closely, established a Band Saw Department, and then proceeded to hire the best mechanical talent in the country.

A careful study of conditions and competitive machines brought us to this fact; that the machines offered were not built as good as possible and then sold at a reasonable price—they were built to sell at a certain price.

We know that a policy of that nature could not make good to the fullest extent. So instead of putting on wheels that are cast (rim, hub and spokes) together, we made a radical departure—actually had STEEL RIMS made elsewhere at a greater cost for the rim alone than we could have cast an entire wheel.

We found that staggered steel spokes in combination with the steel rim, would give a perfectly balanced, very stiff, light running wheel. That was a point scored for us.

Then the straining devices in use at that time were cumbersome, weighted, etc.,—everything but simple. We remedied this by perfecting the simplest straining device on the market. Every part is balanced over knife edges and the force is exerted in straight lines—direct from weight to fulcrum and from fulcrum to upper bearings.

Other points—the superiority of which can be seen by even a novice, are the Variable Speed Device, Safety Saw Guide, Frame Without Overhang, Double Wheel Bearings, Roll Construction—in fact there is no reason why we shouldn't be busy in our Band Saw Department.

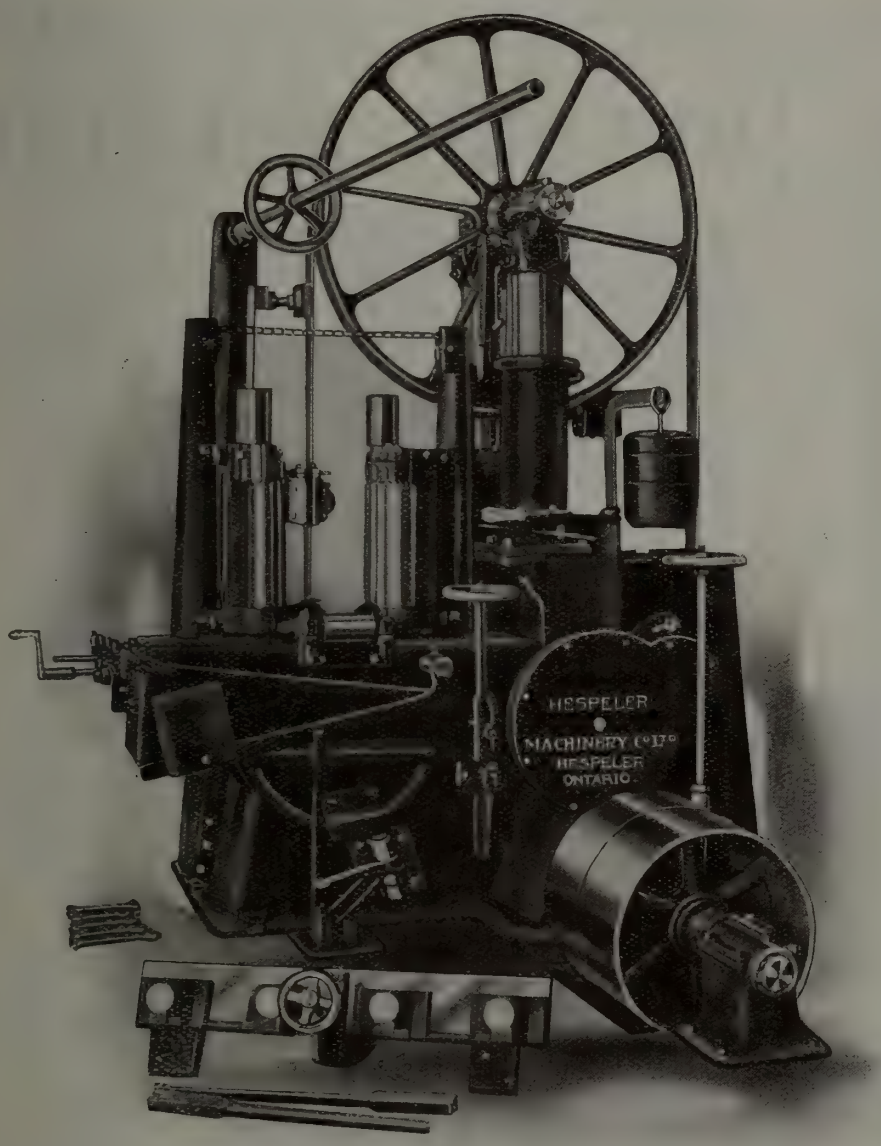
The "341", cut of which is shown, carries a 6-inch blade and because of its having the lightest wheels and carrying a short saw, it has the greatest capacity of any machine in its class and in many classes of work, we will put it up against any 8-inch blade.

It has all the good features of our heavy saws combined in a medium priced, medium sized machine. It will do twice the work of a circular resaw and make better lumber. It is the busiest machine in any planing mill or box factory.

But the "341" is just one of our big line. Just write us for details of any kind of a Band Resaw you require.

Ask us to send your operator a copy of our booklet "Fitting and Operating Band Saws." It is a booklet well worth his careful reading.

Berlin Machine Works, Limited



Hamilton - Canada

Builders of Berlin

Sanders, Sizes, Matchers, Moulders, Surfacers, Planers, Jointers, Edgers, Rip-Saws, Re-Saws.

Are YOU Interested in a Good Band Re-Saw?

Then Study This One!

A close examination of the cut will show you what a complete, strong and well built re-saw this is. Made in three sizes viz :

No. 230, wheels 54 in. in diameter carrying saws 5 in. wide.

No. 232, wheels 48 in. in diameter carrying saws 4 in. wide.

No. 234 wheels 42 in. in diameter carrying saws 3 in. wide.

THE FRAME is cast in one piece, cored out hollow underneath, is heavily ribbed and perfectly rigid.

THE ROLLS will tilt from 0 to 1 inch in 6 inches to allow for the successful sawing of clap boards and general bevel work.

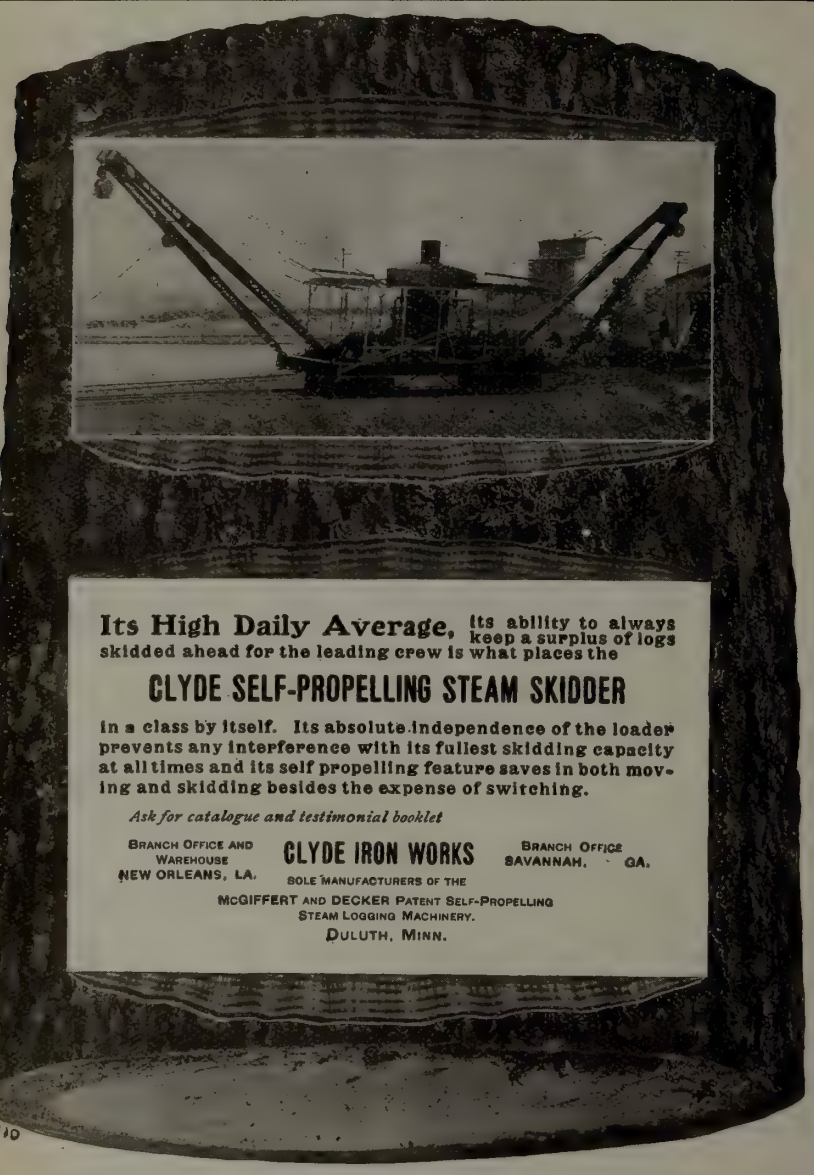
Hespeler, Ontario, Canada



The Spark Extinguisher

shown in illustration was sold by us about a year ago to the Chicoutimi Pulp Co., Limited. It has been so satisfactory that we have just shipped two others to the same company for use at other mills. If you use wood for fuel you cannot afford to be without this apparatus. It is guaranteed to extinguish all dangerous sparks and will not affect the draft. Made to fit any stack or chimney.

Mowry's Jumbo Edger and Gang

Separate or Combined

THIS IS ONE OF THE BEST MACHINES manufactured in Canada. We have sold quite a number of these machines and have some splendid recommends for them. Mandrel is 4½ in. diameter by 10 ft. 6 in. long. Drive pulley is 20 in. x 20 in. The machine is five feet seven inches inside of frame. It has two water boxes. Two stationary and two movable saws (or more if desired). It has eight stationary saws for the gang side (or more if desired). It will rip up cants to eight inches thick. Take a slab off two sides of your small logs and run the log through the "Jumbo" and it will come out in boards. It is impossible for the cant to fly back. It has reverse gear so that if a cant binds the operator can touch a lever and run the log back. 24 in. or 26 in. saws are used. Prices quoted on application, with or without saws.

We make all Kinds of up-to-date Saw Mill Machinery

This Saw Stands Without a Rival

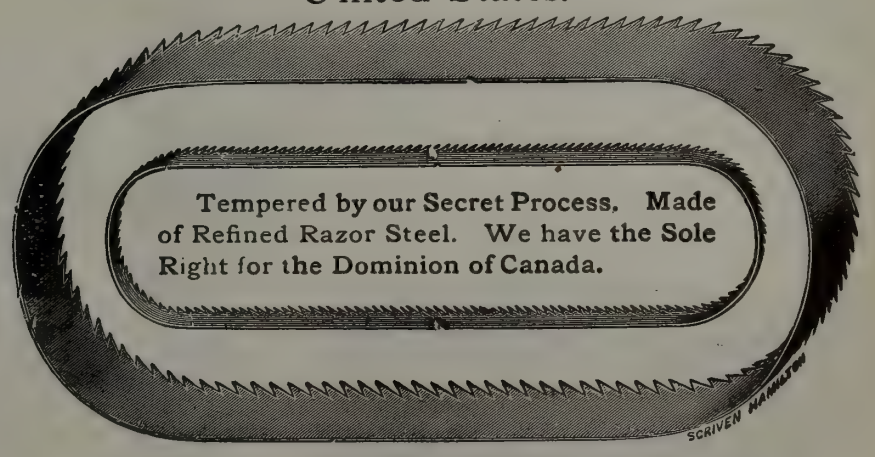
AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

MANUFACTURED BY

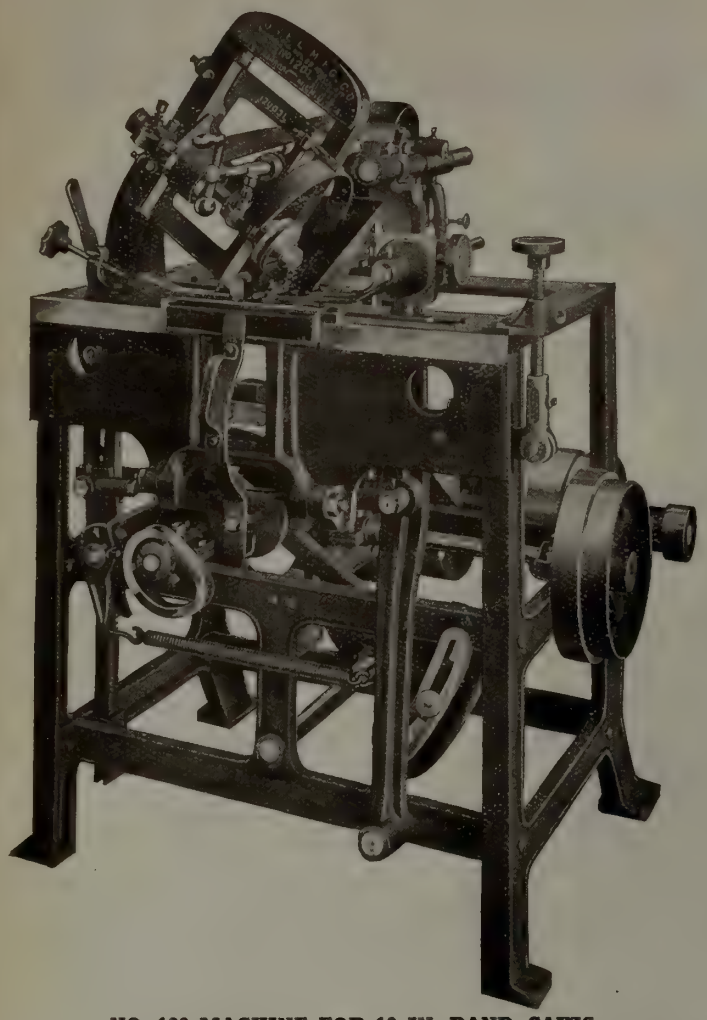


SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Razor Steel, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

NO. 120 MACHINE FOR 10 IN. BAND SAWS.

SAW MACHINERY

The Most Efficient Band Saw Sharpener Made

Equipped with **new automatic idler** bracket keeping the belt to the emery wheel at the same tension as it travels up and down. Idler pulley is located on slack side of the belt and can be adjusted in line with the emery wheel. Belt is held to same tension at all times by a large spring. There are **no flange pulleys** used on this machine, with the use of automatic idler the life of the belts is prolonged. **Head** is constructed with 60 degree angle shaped slides on both sides so that **wear can be taken up by adjusting one gib.** Every wheel arbor can be adjusted so that a straight wheel will do the same work as a concaved one. Head is adjusted to a 45 degree hook.

Saw rest is moved up and down by hand wheel at the right hand side of the machine, convenient for the operator. Adjusting screw is so placed that it **cannot become covered with emery dust.** The saw rest is made of self hardening steel and can be easily replaced. **Back feed** is of a new design and is strong, simple and effective. The adjustable eccentric cam on the cam shaft is connected to the long back feed shaft by means of a lever, this lever rocks the back feed shaft that moves the back feed arm. Back feed finger can be turned out of the way and allow saw to be lifted up without interfering, machine is equipped with an **adjustable cam.**

To those interested in the highest type of machinery of this kind we invite your inquiries and ask permission to send detail description.

Twelve Good Reasons Why—

Our 1910 Model Band Mill is the most up-to-date, most compact, easiest operated, and fastest cutting mill as yet designed

Because—

The base extends completely around the mill.
The upper wheel is supported above and below mandrel.
Top Wheel has extra wide range of adjustment.
The tensioning device is double knife-edged.
The upper wheel is mechanically tilted from front or rear.
Both guides are saw-centre swing, single or double cutting.
Upper guide is absolutely rigid, non-breakable, water cooled.
Operating mechanism is direct, rapid and power driven.
No belts to gum or slip.
All mechanism is enclosed within column.
Lower Guide is extra high and opens instantaneously.
Every part is accessible.

This Mill is completely described in Bulletin No. 102. Send a post card for it.

A light man, with this machine, can cut more and better lumber than the strongest setter you ever had

More lumber, because—It is steam operated. That means it works quicker than any man possibly can.

—It cannot tire—a man using it cuts as much lumber the last hour of the day as during the first hour.

—It will set up to four inches with one throw of the lever, instead of only two inches as all hand machines do.

Better lumber, because—the travel of the piston must be exact, and therefore it is a mechanical impossibility for the machine to make uneven lumber.

Then you are not dependent upon big, strong men only to do your setting. You can employ a setter for his ability regardless of his size.

THE
Pembroke Lumber Co.
Pembroke, Ontario
Manufacturers of
Sawn Lumber, Lath, Sash, Doors and Factory Material
Dimension Bill Stuff in
Pine, Spruce and Hemlock
A full line of dry lumber in stock for prompt shipment. Let us give you our prices for anything you require in lumber.

Pine Doors
We have long appreciated the fact that price is not the only requisite a dealer must seek in placing his order for doors. Poorly manufactured doors can scarcely be considered a bargain at any price.
Door Making is our Specialty
We have equipped our plant with the best door machinery made, and we are turning out doors that **are right in quality and right in price.**
Our doors need no commendation. They prove themselves. They are business builders for every dealer who handles them.
If you have not received our latest quotations on Doors, Sash, and Interior Trim, write us to put you on our mailing list. It will be mutually advantageous.

More Work and Better Work

at LESS Cost

if you use Hespeler Machinery

Our No. 161 Tenoning Machine with Double Copes.

Points of Superiority

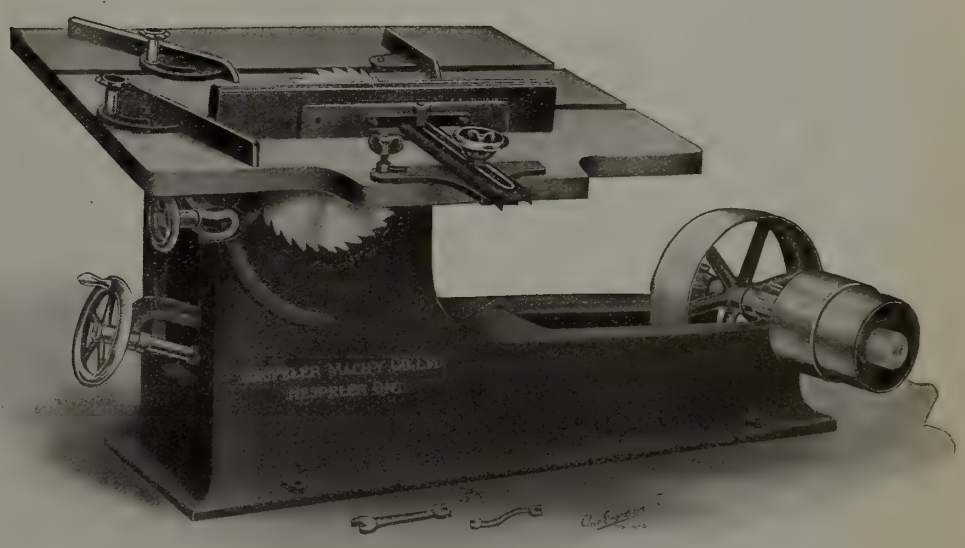
The Heads are of the latest pattern carefully balanced and capable of running at the highest necessary speed. It will cut at one operation 5¼ in. long and 17 in. wide, or in two operations 8½ in. long by 17 in. wide.

The Top Headstock has horizontal adjustment to allow the shoulders on the tenon to be cut even or uneven distances from the end. Both headstocks can be moved up and down independently, or if desired can be moved together without changing the thickness of the tenon which we believe is a unique feature of this machine.

The Table is an improved combination roller table which moves with the greatest of ease. A guard and wiper is supplied to prevent dirt accumulating on the ways thereby avoiding poor tenons.

This machine is made in several sizes which are fully described in our catalogue. Have you a copy? You should have.

No. 209 Dimension Saw Table.

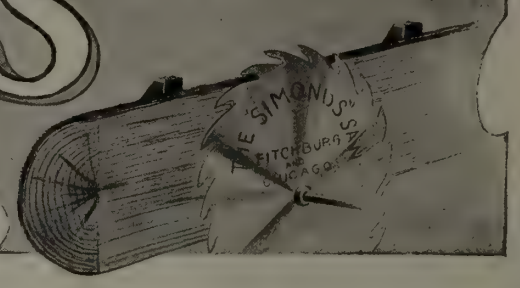


Some of its Good Points are:

The Saw can be instantly adjusted to suit the various thicknesses of material by means of hand wheel shown, the incline being arranged to such an angle that no variation in the length of the belt is required.

The Ripping Fence or gauge, is clamped to the table and can be adjusted to allow material up to 21 in. in width to pass between it and the saw. The fence requires no cross slots in the surface of the table to keep it in line with the saw, or if desired it can be set at a slight angle.

Tight and Loose Pulleys are 10 in. x 5 in. face and should run 640 revolutions per minute.
Length of belt 12 ft. 10 in. x 5 in. wide.
Speed of saw 2560 revolutions per minute.
One 16 in. saw is furnished with each machine.
Shipping weight approximately 1400 lbs.



This model saw table is more fully described in our catalogue. Get a copy if you haven't one.

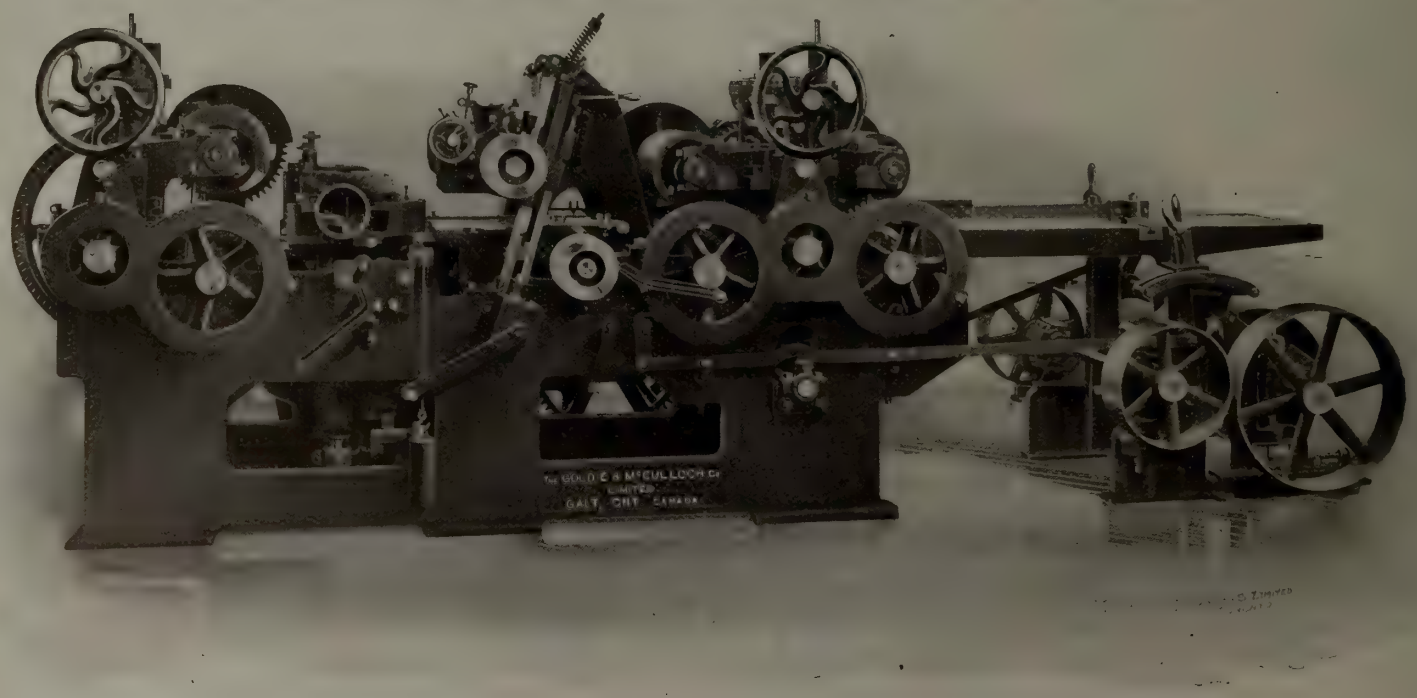
Simonds Saws

There is this, that you can count on, in all Simonds Canada Saw Company's Circular Saws, solid or inserted tooth, whatever the gauge, whatever the tooth, whatever the use—Uniformity.

Buy a Simonds Saw to-day and duplicate your order any time afterward, and you get the same temper, the same material, the same trueness, the same adjustment, the same finish, the same strength, the same cutting qualities, the same all around satisfaction, that you got in your first purchase and that led you to call again for a Simonds Saw.

No time was too long, no effort too vast, no pains too great, for us to take in securing the Simonds Standard of Quality of saw, and there is nothing on this globe that can hold us back from maintaining the uniformity of that standard.

We make every kind of Saw used in lumbering and mill work, and on woodworking machinery, Cross Cut, Band, Gang, and Solid and Inserted Tooth Circulars.



(To buy right—let your order read Simonds)

Simonds Canada Saw Co., Limited

Montreal St. John Vancouver

No. 11 Heavy Flooring Planer and Matcher

Designed for Fast High Grade Work in Hard or Soft Wood

There is no better Hardwood Flooring Planer than our No. 11 on the market.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For Manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 30 Toronto, June 15, 1910 No. 12

Duty Needed on Foreign Staves

The cooperage manufacturing industry in Canada seems to have fallen upon evil times during the last few years, and although, on account of the prospective season of activity this summer, matters are a little brighter now than usual, there is much probability that until the Dominion Government gives a helping hand, the industry will continue to languish. The situation is clearly explained in an article appearing elsewhere in this issue, written by Mr. James Innes, of Chatham, one of the best posted cooperage manufacturers in the country. There was a time, not many years ago, when the production of cooperage in Canada was a prosperous industry. With a plentiful supply of raw material and extensive markets at home and abroad, there was a good profit to be secured, but through a mistaken action on the part of the Dominion Customs Department the business has been almost ruined. There is no longer any possibility of making a profit out of manufacture of staves. Foreign staves made from gum lumber by negro labor can be sold in Ontario, which they enter free of duty, at prices which prohibit the manufacture of staves in this country. Only the heading and hoop industry is left to Canadians, and also the marketing of assembled cooperage, made of foreign staves. This condition has been brought about by a step which is hard to understand. The Customs Department decided that staves were not staves. In other words, they are simply rough lumber and as such entitled to free entry into Canada. There can be no excuse for any government taking so unpatriotic a view of the situation. The sole object of a customs tariff, beyond the raising of revenue, is to foster home industry. The ruling upon staves strangles it, and encourages foreign industry which is conducted upon lines entirely at variance with Canadian ideals. The gum lumber of the southern States is secured at a ridiculously low stumpage cost, when compared with Canadian stumpage. The negro laborers live on wages which would not enable a Canadian to feed himself decently. Yet this negro labor is encouraged by our Customs regulation and Canadian laborers and Canadian capital are suffered to remain idle. If the foreign staves were produced under economic conditions similar to those in existence in Canada, there might be reason in providing other Canadian industries with cheaper barrels for the marketing of their products, but it is folly to ruin a prosperous industry for the sake of an infinitesimal advantage to the consumers of barrels, when that ruin involves encouragement of labor conditions closely analagous to slavery.

The benefit secured by the consumers of barrels is a very doubtful one. Formerly they used very largely the product of Canadian mills and benefitted by the competition among those mills. The labor and capital employed in those mills added their share to the activity of the markets to which goods in barrels were sold. To-day, with the great inpouring of foreign staves, foreign markets have been secured and it is questionable whether barrels can be bought any cheaper now than they could if the staves paid a small duty. Ten per cent., it is said, would be duty enough. This would be much less than the average duty upon protected goods in Canada and could not be considered as a burden by the consumer. Altogether, it would be difficult to find a more reasonable case for the imposition of a duty. Canadian labor and capital would be benefitted and no one would be injured.

Lumber Export Trade Increasing

Canada's foreign trade in lumber during the year ending March 31, 1910, showed a distinct improvement as compared with the previous year, according to the trade and navigation statistics published by the Department of Customs. The details of these statistics are published elsewhere in this issue. Exports of wood and manufactures of wood for the year were valued at $53,522.142, against $44,657,047 in 1909. The imports were valued at $11,462,522, against $7,786,170. In practically all the important classes of exports of lumber and manufactured wood an appreciable increase is shown and in the few cases in which there are decreases they are either in unimportant classes of exports or are so slight as to be of no concern. In the export of planks and boards the statistics show that for the fiscal year ending March 31, 1910, the total was $23,253,219, which is an increase of $4,075,128 as compared with 1909. This increase took place entirely in the exports to the United States, which amounted in value to $17,877,863, as compared with $14,814,106 in 1909. To Great Britain the exports of planks and boards amounted in value to $1,387,439, a decrease of about $80,000. In pine deals the exports to Great Britain showed a decrease of a little over a million dollars, the total value for 1910 being $1,556,229. To the United States the exports of pine deals amounted in value to $83,305, an increase of about $22,000. In spruce deals the total exports were $6,461,280, an increase of about $1,100,000. To Great Britain the exports of spruce deals amounted to $5,825,732, an increase of about $1,100,000. To the United States the total exports of spruce deals were $572,103, an increase of about $220,000.

The exports of laths to Great Britain amounted in value to $1,852,111, an increase of about $270,000. Exports of shingles to the United States totalled in value $2,298,055, a decrease of about $230,000. Exports of shooks were valued at $240,931, an increase of about $124,000. Staves and headings were exported to the value of $94,479, an increase of a little over $4,000.

Exports of piling were valued at $129,418, an increase of about $55,000. Poles and posts each increased slightly. Exports of shingle bolts were valued at $172,764, an increase of about $25,000. Railroad sleepers were exported to the value of $422,214, an increase of $132,000. There was a slight increase in the export of birch square timber and also red pine square timber. Elm, maple, oak and white pine square timber decreased slightly. Other square timbers decreased considerably, their total being $33,101, against $135,676 in 1909.

Exports of pulpwood were valued at $6,076,628, an increase of nearly $2,000,000. Wood pulp (chemical) was exported to the United States to the value of $1,597,319, an increase of $374,000. To Great Britain the exports of chemical wood pulp were valued only at $42,252, a decrease of $300,000. A slight decrease was also shown in the exports of chemical wood pulp to other countries. In mechanical wood pulp the exports to the United States were valued at $2,577,990, an increase of $737,000. To Great Britain the total was $888,898, an increase of $146,000.

The imports of dutiable wood products showed few important changes, the greatest increase being in the group classified as manufactures of wood (not otherwise provided for), the total of which was $1,142,513, an increase of about $300,000. Veneers of oak, redwood, etc., were imported to the value of $212,826, an increase of about $80,000. Imports of wood pulp from the United States were just stationary at $31,034. Imports of sawed boards, planks, deals, etc., planed or dressed, amounted in value to $102,950, practically the same as in the previous year.

Among the free imports the most noticeable change was in oak lumber, the total being $2,146,359, an increase of about $760,000. Imports of pitch pine lumber decreased slightly, the total value being $1,028,483. Imports of planks and boards were valued at $1,852,542, an increase of $742,000. Imports of walnut lumber from the United States were valued at $26,556, an increase of about $3,100, and a similar increase occurred in the imports of white ash from the United States, which were valued at $65,146. Imports of mahogany from the United States were valued at $156,645, an increase of about $25,000. From Great Britain the mahogany imports were valued at $19,105, an increase of about $13,000. Fence posts and railroad ties from the United States were imported to the value of $663,825, an increase of about $22,000. Hickory and oak spokes were imported from the United States to the value of $185,928, an increase of about $80,000.

In connection with the above figures relating to the foreign trade in wood and manufactures of wood, the following figures relating to the foreign trade of Canada in general are of much interest:

For the twelve months ended March 31, 1910, the trade of Canada in merchandise was $668,530,064, showing a betterment over the same period in 1908, which was the record year in the history of Canadian trade expansion, of $53,336,088, a gain of about 8.7 per cent, but when compared with the figures for the same period in 1909, the betterment was $120,472,348, a gain of about 22 per cent.

The imports of merchandise for consumption into Canada were valued at $369,766,071, showing an increase over the same period in 1908 of $17,941,047, a gain of about 5.1 per cent., but in comparison with the same period in 1909 the increase was $81,630,721, a gain of about 28.3 per cent.

The exports of merchandise from Canada during the same period in 1910, were $298,763,993, showing an increase over the same period in 1908, of $35,395,041, a gain of about 13.4 per cent, but the increase over the same period in 1909 was $38,841,627, a gain of about 15 per cent.

The exports of the products of the farm during the same period in 1910 were valued at $144,360,262, or 51.7 per cent. of the total exports from Canada, while the exports of the mine, the fisheries, the forest and of manufactured goods were valued at $134,726,114, or $9,634,148 less than the value of farm products exported.

Exports of forest products for the last four years were as follows: 1910, $47,517,033; 1909, $39,667,387; 1908, $44,170,470; 1907, $45,823,172.

Take no Chances on the Fire Fiend

So many of the prominent lumber concerns in Canada have adopted good regulations for the prevention of fire that advice upon the subject might be considered presumptuous. Yet there are hundreds of firms to-day which are trusting to luck and imagining that the only thing necessary is to take out some insurance, however, inadequate. Insurance is not a guarantee against fire, however much one may think so. The only real insurance is a combination of a policy in a good company with the taking of every precaution to see that fire gets no opportunity to occur. With this combination only, can the owner of a mill or yard go about his business free of anxiety about fire and sleep soundly at night.

There is only one way to deal with the problem after a policy has been taken out. That is to sit down and seriously figure out all the possible factors which favor the occurrence of fire and then go systematically to work to eliminate them. Every man who has the problem to solve must do it in his own particular fashion, but the practice of others will give useful assistance. The following rules, compiled and adopted by a large lumber company in the United States, are applicable to any sawmill or lumber yard. The enforcement of these requirements will leave little food for flames, and will keep the fire fighting facilities in condition to quickly smother any incipient blaze.

1. All casks and fire pails must be kept full at all times. Under no circumstance are fire pails permitted to be used for any other purpose.

2. Fire hose attached to standpipes must not be removed, and must not be used for ordinary purposes.

3. All fire doors and shutters must be closed and fastened at night.

4. Greasy or oily rags and cotton waste must be deposited in oily waste cans especially provided for that purpose. These cans are to be taken to the boiler house and contents burned after each day's work.

5. Steam pipes must be kept clear of all combustible matter and must never be allowed to remain in contact with wood.

6. Line shafting must be kept clean. Dust and grease must not be allowed to accumulate on the bearings. When oiling the journals all dirt and dust on shafting and bearings should invariably be brushed off. A small whisp broom may be used for this purpose.

7. Drip cups under bearings must be emptied regularly. Oil must not be allowed to drip on floor beneath bearings or on surrounding woodwork.

8. During repairs shavings and debric of all kinds must be removed from the building each night; after repairs are completed all unused material must be removed from the building.

9. No smoking will be allowed on these premises.

Foremen and superintendents are expected to see that these rules are faithfully observed.

Employees neglecting any of these regulations or violating any of these rules are liable to instant dismissal.

Reciprocal Trade Relations with the U.S.

It begins to look now as though, after the lapse of a few more months, during which to feel the public pulse carefully, the Canadian Government will not respond with enthusiasm to the request of the Government of the United States for closer reciprocal trade relations. The time was, when an invitation of this nature from Washington would have been hailed as something of a political victory in Canada. To-day, it is welcomed rather as a commercial than a political victory. Canada's trend in commerce of late years has been all in the direction of independence of any one great market. She has been selling her goods in all markets against competition of every nature, and above all, she has been selling her goods to Englishmen, in many parts of the globe. quarters of the globe.

Canada does not need reciprocity to-day. Rather does she need caution against too easy access to her home markets for the products of the United States. There is no feeling of prejudice against the people of the United States in Canada, but there is a well-founded belief that United States goods are produced, in too many instances, under economic conditions which are not satisfactory to Canadian ideals and that, therefore, unless similar ideals are to be introduced into Canada, these goods must be prevented from flooding our markets.

So much for the broad question of reciprocity. Then there is the particular question of the conservation of our natural resources to be considered, and upon this line Canada's interests, and especially the interests of Canadian lumbermen, all point strongly in the direction of extreme caution. We sell great quantities of lumber in the United States, yet it is a question, even to-day, whether we would not be better off if we sold them less, and made more certain of a continual supply of lumber for our own needs in the future. The interests of the lumberman of to-day seem to clash with the interests of the lumber consumer of to-morrow, but the clash is not likely to become serious. Lumber is steadily increasing in value and it is conceivable that the profits to be secured by more conservative cutting, spread over an indefinite period

in the future, will be even greater than those of extensive cutting with only immediate returns to consider.

In the United States the political situation is marching rapidly towards something which looks like a tariff revolution. The west is feeling the size of its muscles and is training seriously for a tussle with the east on the question of protection. The east is attempting to improve its position by various methods, not the least interesting being the proposed reciprocity negotiations with Canada, bearing promise of some tariff rearrangements which will be acceptable to the whole country, and appear in the light of a fulfilment of recent anti-election pledges of cheaper goods for the consumers of the important necessities of life.

If Canadians understand their own welfare now as thoroughly as they have in the past, the hopes of the Republicans in the United States will not be greatly gratified by reciprocal trade arrangements. Canadian sentiment is growing rapidly against it, and in regard to lumber, which will be one of the storm centres of discussion, there seems to be no question that Canadians already look upon freer access to United States markets as something of a gold brick. The immediate future, therefore, is full of interest and importance to the people of both countries and events are sure to be followed by Canadians with a watchful eye.

Editorial Short Lengths for Busy Readers

The expert study of conditions prevailing in the St. John river valley, with a view to reaching a settlement of the long-standing dispute between lumber interests operating on the river, is reported to be making good progress. The final settlement of the vexatious problems connected with this matter is of the greatest importance as the conditions at present prevailing involve continual loss to all parties and much ill-feeling which could be avoided. It is to be hoped that nothing will be permitted to interfere with the continued investigation of the problem until a satisfactory settlement is reached.

Possibly an indirect benefit resulting from the prohibition of the export of pulpwood by Quebec Province will be the discovery by United States paper manufacturers of other suitable products from which to make paper. For the purpose of enabling the Secretary of Agriculture to conduct experiments in paper making, the House of Representatives has adopted an amendment offered by Mr. Mann, of Illinois, to the sundry civil bill carrying an appropriation of $30,000. Under this proposition the Secretary is to "test such plants and woods as may require tests to ascertain if they will be suitable for making paper." The appropriation is made immediately available.

The action of the Dominion Board of Railway Commissioners in deciding that the railways were justified in increasing their freight rates on lumber under the pretence of simply systematizing them is in striking contrast with recent events in the United States. The Federal Government of the United States has enjoined the general freight rate advance promulgated by the railroads comprising the Western Trunk Lines Association which was to go into effect June 1. This will bring up the whole question of Government regulation of railroad rates in the United States, a matter which has reached a far more definite condition in Canada. It is a matter for reflection, however, that in a land of great trusts and corporation influences the Government should so determinedly seek to curb the railroads, despite the effect of such an action upon financial conditions, while in Canada where we pride ourselves somewhat in our comparative freedom from corporations, a flagrant instance of corporation greed should be legalized in the face of direct evidence to the effect that it cannot be justified.

The outcry against the cutting of timber in Rondeau Park, Ont., has perhaps been of some value, as the Minister of Lands, Forests and Mines, Hon. Frank Cochrane, has definitely decided upon a much more restricted policy of cutting than the one at first announced. It is difficult to believe, however, that even without the outcry, the Minister would have adopted any but a careful and conservative programme. He is himself a forester of training and skill and is responsible to the country for the best management of this excellent forest reserve. His announcement that the district is to be considered as a provincial park, rather than as a forestry farm, and that only over-matured and injurious tree growths are to be removed, should allay the anxieties of those who have been loudest in their criticisms. As an isolated stand of primitive timber this park is of inestimable value and interest and the Minister will deserve the thanks of the public if he sees to it that it is maintained, not only as a beauty spot but as a museum of living trees. The public will always watch any cutting operations with a jealous eye, but to a certain extent both the value and the usefulness of the park can be increased by cutting. The idea that nature should be left to look after the park unaided is not reasonable. Dead and fallen trees can seriously injure the development of others, and they add greatly to the danger of fire. The Minister's duty is a simple one and merits a sympathetic interest from the public.

The lumber trust fever has spread from Washington to Ottawa, if a recent Ottawa despatch is to be believed. The despatch is as follows: "A number of secret service men are investigating an alleged lumber combine, and should the information warrant it the Department of Justice will begin prosecutions under the Anti-Trust Act. The officials here believe that practically every concern of consequence in the country is interested in the combination and it is suspected those in it fix the price of lumber and even go so far as to dictate to the seller of the lumber, to whom he shall sell. The department is making the investigation on the idea that prices are artificially maintained." We wish the department joy in its search. If it can find any evidence of prices having been artificially maintained of late years it will be a great discovery. If it should extend its search to a study of the depression of the years 1908 and 1909, it will find that there was nothing artificial about that. As a starter, we would recommend a consideration of the causes leading to the assignment of one of the largest and oldest lumber manufacturing firms in St. John, N.B., a few weeks ago. This might save them any further trouble.

The long standing dispute between lumber interests operating on the St. John river, which for a considerable distance of its course forms the boundary between the Province of New Brunswick and the State of Maine, is in a fair way to satisfactory settlement. The trouble has assumed international proportions in several notable cases, and for many sessions Parliament has had to deal with questions involving the general issue of jurisdiction, while conflict of claims of rival companies frequently threatened serious complications. An international commission, of which Mr. A. B. Barnhall, barrister, of St. John, N.B., is chairman, was appointed to deal with the question. As a preliminary, two hydraulic engineers of repute were named as a consulting board to advise upon the plans requisite for conserving and regulating the flow of the river by means of dams and other works. The board consists of Mr. S. J. Chapleau, M.Can.Soc.C.E., M.Am.Soc.C.E., of the Public Works Department, and Mr. H. S. Ferguson, a well known hydraulic engineer of Millinocket, Me. Upon their recommendation the commission appointed a chief engineer and staff to obtain certain data considered essential to the solution of the question of water control. This work, which involves investigation of some 200 miles of the St. John and its tributaries on both sides of the boundary, is now being proceeded with, and when completed will be turned over to the consulting board for use in the formation of a scheme for equitable distribution and regulation of the water flow. At present the St. John river, although an important lumbering stream, is without any such general scheme of improvement as obtains on the Ottawa, lumbermen and riparian owners exercising independent control at various points on the stream regardless of the interests of others equally interested in the utilization of the river for floatation or power purposes. Interested vitally in the working out of the proposed plan of regulation is the Grand Falls Power Development Company, of which the chief engineer is Mr. J. M. McRae, of Ottawa, who constructed the Chaudiere retaining dam. The work of investigation on the St. John will continue over the flood-water period of next spring, as the conditions this year were abnormal, on account of the absence of the usual spring floods.

Canadian Lumber in Foreign Markets

Exports of Wood and Manufacturers of Wood Increased Nearly Nine Million Dollars in Value—Statistics of Exports and Imports for Fiscal Year

The following statistics of Canada's foreign trade in wood and manufactures of wood for the fiscal year ending March 31, 1910, have been published by the Department of Customs. A consideration of the leading features of the statistics is to be found elsewhere in this issue:

Following is a summary of the exports of wood and manufactures of wood, of domestic origin, and the imports for the twelve months:

	1909	12 Months ending March, 1910		
Exports		Total	To United Kingdom	To United States
Logs	$ 928,351	$ 999,681	$ 39,324	$ 958,969
Lumber—Deals, pine	1,694,277	1,653,437	1,556,229	83,305
Deals, spruce and other	5,321,790	6,461,280	5,825,732	572,103
Laths, palings and pickets	1,806,129	2,106,937	18,204	2,048,846
Planks and boards	19,167,778	23,252,705	1,387,439	17,877,349
Shingles	2,581,755	2,331,443	1,274	2,298,055
Timber, square	1,179,088	934,723	907,759	21,103
Wood blocks for pulp	4,356,391	6,076,628	.....	6,076,628
Wood pulp	4,306,929	5,204,597	931,150	4,175,309
Wood and manufactures of	$44,657,047	$53,522,142	$12,393,903	$36,061,920
Imports				
Wood and manufactures of	8,786,170	11,462,522	251,442	10,912,619

Exports of Forest Products

Exports of forest products for the fiscal year and for the month of March, compared with those of the previous year, were as follows:

	March		Twelve months.	
Article	1909	1910	1909	1910
ASHES, pot and pearl:—				
To Great Britain	$3,027	$1,273	$29,663	$24,511
To United States	422	181	1,856	820
To other countries	.....	.....	2,378	2,432
ASHES, all other:—

Foreign Staves Should Pay Duty

Free Importation of Gum Staves has Depressed Canadian Manufacture—A Ten Per Cent. Tax Would be Enough

By J. Innes.

During Cleveland's administration, there were exported from Canada into the United States over 250,000 staves per year. At that time, staves were admitted into the United States free of duty. There were no hoops or heading exported to the United States, for the reason that the dut yremained at 35 per cent. ad valorem. Just as soon as the McKinley Bill came into effect, the export of staves from Canada to the United States decreased until now very few staves are exported from Canada into the United States, except of the lower grades, on account of the 10 per cent. duty. The consequence is that a great number of mills have gone out of commission, partly on account of the duty and also on account of the increased cost of stumpage, the scarcity of standing timber suitable for staves, and the high wages in Canada. A great many of the mills would still be running but for the fact that staves manufactured in the United States are admitted free into Canada, under one of the most peculiar rulings that was ever made by the Customs officials.

The Canadian tariff of 1907, item 500A, reads: "Staves in the rough of poplar, general tariff, 20 per cent. duty." The Hon. Wm. Patterson, and the Commissioner of Customs, Mr. J. McDougald, however, have decided that staves are not staves, but should be admitted under Item 504: "Planks, boards and other lumber of wood, sawn, split or cut and dressed on one side only, but not further manufactured, free." The consequence is, that on account of the cheap cost of gum stumpage in the South, and cheap negro labor, staves can be manufactured there, freight paid on them, and laid down in Canada at a less price than staves can be manufactured out of the native Canadian woods, and white wages paid. The importation of gum staves into Canada has reached quite large proportions.

The timber formerly put into staves in Canada is now being put into lumber, veneer, mill stuff, etc., the consequence being that, as it takes fewer men and less money to manufacture these goods than it does staves, the number of men employed in the lumber industry has been seriously reduced.

I do not like to express my opinion of the ruling of the Customs Department of Canada, but I think it would have been much better if, before making a ruling of this kind, they had consulted practical men in the business, as it certainly does no good to anybody to admit these staves free of duty, and must do considerable harm to the working classes in the country, and also to the farmers and others who own the timber.

On account of the United States market being cut off, the manufacturers of staves sought other markets, and have got considerable export trade, but, unfortunately, the cheap stock manufactured in the south of the United States is taking this market, and our company are using cheap southern staves now almost entirely for their export trade, as otherwise they would not be able to compete with the southern manufacturers.

A great many of the cooperage mills have closed down and gone out of business; others have gone into the manufacturing of lumber, veneer, handles, etc., and are using their timber up in this way. The principal timbers used for staves are elm, maple, birch and ash. These timbers are now valuable for veneers, and on account of the low price of cooperage stock, which is kept down on account of these importations from the United States, a great deal of the timber is being put into veneer.

Unfortunately, it costs a great deal of money to put in a modern up-to-date veneer plant, whereas a stave mill can be put in for $4,000 to $5,000. A good veneer plant cannot be put in for less than $50,000 to $75,000, according to the size. It does not cost much, however, to put in a small lumber mill, and consequently a great many of the cooperage mills have been turned into lumber mills. At present prices, there is more money in the manufacturing of lumber than cooperage stock.

Taking the basis of price as $16 per 1,000 feet for logs, the following is how the operation would turn out:

Making Lumber—	
Cost of logs, per 1,000 feet	$16.00
Cost of making into lumber	4.00
Total per 1,000 feet	$20.00

We might say, however. that $4 per 1,000 feet is a high price for manufacturing, as very often the gain in lumber measure over log measure will reduce the cost of manufacturing to almost nothing, while the price of this lumber averages $25 per 1,000 feet, leaving a minimum profit of $5 per 1,000 feet.

Making Staves—	
Cost of logs per 1,000 feet	$16.00
Cost of making 3,500 staves, at $2.25 per 1,000..	7.87
Total	$23.87

The average prices of staves, $7, equals $24.50, leaving a profit of 73 cents per 1,000 feet, as against $5 per 1,000 feet in lumber.

Take basswood logs at $16 per 1,000 feet to put into lumber, the result would be as follows:

Making Lumber—	
Cost of logs per 1,000 feet	$16.00
Cost of sawing	4.00
Total, per 1,000 feet	$20.00

The average price of basswood lumber is $24 per 1,000 feet, leaving a profit of $4 per 1,000 feet.

Making Heading—	
Cost of logs per 1,000 feet	$16.00
Cost of making 350 sets heading, at 2 cents...	7.00
Total per 1,000 feet	$23.00

The average price for heading at the present time is 5 cents per set, netting $17.50, or a loss of $2.50 per 1,000 feet.

I might say, however, that in making heading, quite a quantity of top logs and bolts are used, which would not go into lumber, consequently there is a small margin in manufacturing heading even at 5 cents per set, but not enough to make a living for the manufacturer, and unless heading will average 6 cents per set, there is nothing in it.

In an ordinary year, with a good apple crop, heading will average this price, and consequently the manufacturers of heading live in hopes of being able to make something.

In making hoops there is a fair margin for the manufacturer, first, because there is a protective duty of 25 per cent. against hoops from the United States; second, because good hoop timber is somewhat scarce, and fair prices can be obtained for hoops.

There is no doubt that a considerable impetus could be given to the manufacturer of cooperage stock in Canada, by the Customs Department giving a sensible ruling under what class staves should be admitted into Canada. Even a 10 per cent. duty would put things in shape so that the manufacturers would be able to compete with cheap southern staves, as, while in the south they have the advantage of cheap stumpage and cheap labor, the rates of freight are high to the consuming points in Canada, and the difference in freight would help to offset the higher cost of stumpage and labor.

There is very little chance of getting the Minister of Customs to listen to reason at the present time, as the elections are too far away. There is no question that this matter will right itself before a great many years have passed, as gum timber is coming to be used for a great many other purposes, and in the past ten years has advanced from 10 cents per 1,000 feet stumpage for timber to $3 per 1,000 feet. This, however, is a very light cost of stumpage as against from $10 to $12 per 1,000 feet stumpage in Canada, where the same situation exists, namely, good level ground and easy lumbering.

Good Outlook for a Large Apple Crop

The Sutherland-Innes Company, Limited, Chatham, Ont., give the following report of the cooperage stock market:

This is the quietest season of the year in the cooperage stock industry, and business is not likely to improve to any extent until about the first of July.

The prospects for future business at the present time are excellent. The crops look well. There is every prospect of a good apple crop, and trade throughout the country is improving all the time. The production this year will be lighter than for years, partly on account of the high prices of stumpage, but more particularly on account of the low prices at which cooperage stock is selling.

There was very little stock carried over from last year in staves and hoops; considerable heading stock was carried over, but the decreased production this year will no doubt soon get rid of the surplus.

Prices are about the same as they have been for the last 12 months, and there is not likely to be any change for some time. The consumption of certain grades of stock throughout Canada is increasing, while the sugar trade is not using as much material as it did some years ago.

The pure food law in the United States and the campaign in connection therewith have opened the eyes of the consumers of food products to the advantage of the barrel as a sanitary package, and consequently more flour barrels and cereal barrels are being used than ever before in the history of Canada.

Some of the sugar refineries are also beginning to use more barrels, and as the consumers realize the great advantage from a sanitary point, and also the great convenience in handling, the use of the barrel in Canada will continue to increase. Nothing has been found so satisfactory as the barrel for shipping winter apples, and with the good apple crop which is in prospect, this year there will be a complete clean up of all the stock which is manufactured in Canada this season.

The store of the Rat Portage Lumber Company at Grassy Lake has been sold to a Mr. Anderson.

Lumber News from Maritime Provinces

Reported Sale of the Dickey Properties—Destruction of Mills of St. Anthony Lumber Coy. by Fire—Recent Rainfalls have Improved Logging Situation

The lumber market conditions at Boston are referred to in a letter to the "Canada Lumberman" from a large Boston firm as follows: The developments in trade here are not very marked in any respect except that eastern spruce is weaker, that is, dimension stock. Boards, we think, are fully holding their own. Canadian spruce seems to be holding its own. Shingles are weak at quoted prices. There seems to be considerable overstock of shingles and it is freely predicted that the eastern shingles will go decidedly lower before midsummer. Vermont matched spruce boards are rather scarce and we think $21.50 is rather below the market. $22 is nearer the figure, though they may still be sold at $21.50. Eastern hemlock has been scarce and firm, i.e., hemlock boards. Pine is very little changed. General conditions here seem to be still of a rather uncertain character. Although most people are having a fair amount of business, everybody feels they cannot tell on just what to count. The stock market's having gone so decidedly wrong, rather affects general sentiment. The fear of adverse legislation add the strict enforcement of some of the anti-trust laws has kept business in a rather uncertain state.

Sale of the Dickie Properties

Announcement is made that the Dickey limits of Nova Scotia have been taken over by the Dominion of Canada Securities Company, composed of the Earl of Denbigh, John Howard, Agent-General of Nova Scotia in London; Sir Frederick Borden, A. K. Maclean and several London financial men. The properties covered by this deal are located at eight different points, seven of them east of Halifax harbor, and one in the western part of the province. The eastern areas cover 345,000 acres, and the western 60,000 acres. Approximately they are as follows: Stewiacke, 80,000 acres; Musquodoboit Harbor, 50,000 acres; Lawrencetown, 10,000 acres; Ship Harbor, 45,000 acres; Moser River, 20,000 acres; Liscomb, 50,000 acres; Sherbrooke, 90,000 acres; Tusket (Yarmouth), 60,000 acres; total, 405,000 acres.

Each of these areas has a thoroughly equipped mill. It is also reported that the same company is negotiating a deal with the Nova Scotia Government for the construction of the Nova Scotia Eastern Railway between Halifax and Country Harbor, running through the Pictou coal country.

The approaching completion of the National Transcontinental Railway in New Brunswick is a matter of much importance to the lumbermen of the province. The road taps the richest lumber lands of the province, and already a large number of inquiries are being received regarding prospects for lumbering operations and allied industries. The certainty of getting out lumber by rail more than compensates for the extra cost over stream driving, and operators will be anxious to avail themselves of the opportunities offered by the road as soon as direct connection is made with St. John. Mr. C. O. Foss, district engineer, believes that the road is destined to revolutionize the lumber business of the province and make river driving a thing of the past. It will make extremely valuable in the future immense quantities of hardwood standing in the interior of the province and now worthless because of the impossibility of getting it out.

Destruction of St. Anthony Mills

The mills of the Anthony Lumber Company at South Maitland, N.S., were destroyed by fire on June 5th. The loss will be $90,000, on which the insurance is about half that amount. The chief owners of the mill are New Yorkers, A. S. Horsley of that city being the managing director. The mill was the best in Nova Scotia, with one exception—that of the Davisons on the La Have. The fire carried off the mills in half an hour from the time the blaze was first observed. The advance of the flames was so rapid that four cars of lumber ready for shipment could not be pulled out of the shed, and were destroyed with the rest of the property. The power house, which was of brick and steel, escaped, but not a stick besides was left. The company have three million feet of lumber ready to be cut. The output of this mill found its market almost exclusively in Boston and New York. The mills were built some five years ago.

S. P. Musson, Son & Company, Barbados, report under date of May 21st, regarding lumberstuffs as follows: "There have been no arrivals in any class of lumber during the fortnight. W. pine—Stocks of this are getting low, and first arrivals should fetch good prices. Spruce—As mentioned in our last, a couple of cargoes have been sold to arrive, but another one would probably sell well. Pitch pine—Supplies are sufficient for present requirements. Shingles—No arrivals of either Gaspe or cedar laying, and both are in fairly good demand. Shooks—No arrivals, and supplies are sufficient for requirements. Wood Hoops—Receipts consist of 45 bdls. imported by a dealer."

James Robinson, of the Miramichi, who was recently in St. John, reports that heavy rains have aided materially in getting out the lumber drives. There are now, he says, only about 2,000,000 feet of lumber hung up along the Miramichi and tributaries. About 1,500,000 of this is along Sabby's river; 300,000 in the southwest branch of the Miramichi, and 200,000 in Barnsby river. The remainder of the logs are now within a very short distance of the booms. Mr. Robinson says that so far this season the driving operations have cost the lumber merchants three times as much as they did last season.

It is expected that a new sawmill will be built at Chatham, N.B., by J. H. Crandall, of Moncton, who has practically closed with Edward Barry for the purchase of a mill site at Morrison's Cove, which is situated on the river about a mile above the town. Mr. Crandall owns extensive limits on the northwest branch of the Miramichi and has 2,000,000 feet of lumber in the river. The proposed mill will contain a rotary and lath machine.

The scale of the lumber cut on Crown lands of the Province of New Brunswick during the past season will total 280,000,000 feet, according to an announcement made by Hon. W. C. H. Grimmer, Surveyor-General. Last year the cut of lumber on Crown lands was scaled at 205,000,000 feet.

The city council of St. John, N.B., has passed a recommendation that Stetson, Cutler & Company be given a lease of the Mispec Pulp Mill for three years.

Lumber Exports from St. John

Exports of lumber from St. John, N.B., from May 18 to 31, were as follows:

Vessel	Cargo
May 18—Orozimbo, Boston	127,020 s.p. feet spruce board.
May 19—Genevieve, Salem	167,918 s.p. feet spruce scantling.
May 19—W.E. & W.L. Tuck, New York.	103,753 s.p. feet spruce scantling.
	1,273,110 spruce lath.
May 19—R. M. Walls, Vineyard Haven..	2,715,400 spruce lath.
May 19—J. A. Beckerman, New York...	2,056,600 spruce lath.
May 19—Preference, New York	324,530 feet spruce deals.
May 19—Arthur M. Gibson, New York..	386,829 feet spruce deals, etc.
May 20—Romeo, Fall River, Mass.	152,455 feet spruce boards and scantling.
May 20—Helen G. King, Quincy, Mass..	144,411 feet spruce boards.
May 23—Georgie Pearl, N. Bedford,Mass.	161,788 feet spruce scantling, etc.
May 23—Beulah, Boston	27,027 feet spruce boards.
	763,000 cedar shingles.
May 25—Hunter, New Bedford, Mass.	215,240 feet spruce planks and scantling.
May 27—Winnie Lawry, New York	262,969 feet spruce deals.
May 27—H. B. Cousins, Vineyard Haven.	2,053,500 spruce lath.
May 28—Nellie Eaton, Boston	119,032 s.p. feet spruce boards.
May 30—Trebia, Buenos Ayres	500,311 s.p. feet pine boards.
	131,493 s.p. feet spruce plank.
	1,006,972 s.p. feet spruce scantling.
May 30—Flyaway, Neponset, Mass.	153,140 s.p. feet spruce boards.
May 30—Shakespeare, Irvine, Scotland	641,315 s.p. feet spruce deals.
	17,969 s.p. feet spruce ends.
May 30—R. Bowers, Vineyard Haven	2,042,600 spruce and pine lath.
May 31—Arkansas, Brow Head	1,696,949 feet spruce deals.
	132,972 s.p. feet spruce scantling.
	96,100 s.p. feet spruce ends.
	192,794 s.p. feet spruce boards.

Archibald Eakins, son of Arthur W. Eakins, of Parker, Eakins & Company, Yarmouth, N.S., was accidentally killed in his mill at Kalispell, Mont. Deceased was engaged at Kalispell in the lumbering and milling business, with his father-in-law. He was 35 years of age and leaves a widow and one child.

Pulp and printing paper manufactured from wood cut on Crown lands in the Province of Quebec prior to May 1st last is subject when entering the United States to the countervailing duty of 25 cents per cord, or its equivalent of 25 cents a ton, in the manufactured state as print paper, as provided by the new tariff law, according to a decision of the U. S. Treasury Department. Like products manufactured from wood cut on Crown lands in Quebec after May 1st are not subject to the countervailing duty. There are large blocks of wood on hand in Quebec (one estimate is 1,200,000 cords) cut prior to May 1st which can be exported, and as to such the export duty would attach. Therefore, it was explained at the Treasury Department, Quebec still collects the discriminating license fee of 25 cents per cord on wood cut on Crown lands before May 1st. For this reason the additional or countervailing duty has been assessed on the products of the wood cut prior to the date mentioned.

B. C. Commission Resumes Work

Important Evidence Received on Logging and Pulp Problems—Proposed National Park in the Kootenays

The British Columbia Timber and Forestry Commission, composed of Messrs. F. J. Fulton, K.C., A. C. Flumerfelt and A. S. Goodeve, M.P., has resumed its sittings. The first matter to come up was a proposal made by G. H. Chapman, of the Canadian Geological Survey, for the establishment of a provincial national park in Kootenay, in conjunction with the Dominion Government, which has set an area apart in Alberta, and the United States Government, which has established one in the neighborhood of the State of Montana. The area which Mr. Chapman suggested might be profitably utilized for this purpose runs from the intersection of the summit of the Rocky Mountains and the international boundary northward to the Kootenay Pass, thence westerly approximately to the Flat Head river and down the river to the boundary. In this there would be about 200 square miles.

The second question brought up was introduced by Secretary McArthur, of the British Columbia Loggers' Association. He urged the necessity for a reform of the British Columbia log scale, claiming that it does not adapt itself to modern fine saw conditions. The scale now in use, he said, involved a loss of about 29,000 feet in a million-foot boom. The Government also suffered a similar loss. It was proposed that instead of the fixed allowance of 1½ inches on the small end of all logs for saw waste, 1½ inches should be retained for 16-inch logs and smaller; 1 inch for logs of 17 to 24 inches, and 1½ inches on 25-inch logs and upward

Mr McArthur also presented a petition that bona fide operators whose timber is exhausted should be allowed a stand not to exceed one square mile of reserve timber, conditionally upon their beginning to remove the timber within 90 days and complete such removal as quickly as possible until no merchantable timber remains. This was specially urged on behalf of the small logger, who was stated now to be practically without timber to work on except at a prohibitive price.

An application was also presented by Mr. McArthur for permission to export rough cedar, for which purpose an appeal was unsuccessfully made to the executive recently. A fourth point raised was in respect to the fire patrol system, Secretary McArthur urging that the conditions of the trade made it impossible for the loggers to sustain heavier burdens.

Commissioner Flumerfelt asked how one cent per acre would suit the trade, and the loggers' representatives agreed that this seemed reasonable.

"If the logger is compelled to burn his brush," said Mr. McArthur, "it will cost more than the logging and they will simply be driven out of business."

The third witness of the day, Mr. J. O'Brien, offered the prediction that within two years the duty would be lifted on lumber going into the United States, and also stated that mills in British Columbia would very soon be manufacturing the low grade cedar. It was urged that much timber now in the water would be ruined if permission to export were not granted, and Commissioner Flumerfelt inquired whether, if the Government granted a suspension of the law to prevent the stated inevitable loss, the lumber would give a guarantee that they would not take this as a precedent and urge similar concessions from time to time.

The loggers were not disposed to give such guarantee and Commissioner Flumerfelt expressed himself as not in favor of requesting the Government to deliberately set aside the statutory law unless such a condition was agreed to.

At a subsequent sitting of the Commission, evidence was presented by Mr. Bremner, of Vancouver, regarding his application for a concession covering 20,000 acres of Government reserved land and 20,000 acres of "abandoned" lands, for the manufacture of fibre pulp. He stated that he represented a company who wished to go into the manufacture of pulp and in his evidence he gave carefully prepared details as to the prospective success of such a company. The members of the Commission seemed inclined to doubt the chances of success and pointed out that so far very little had been done by the four organized companies which had obtained similar concessions.

Interesting evidence was given by Mr. W. J. Sutton, in regard to the extent and character of the standing timber throughout the province. Mr. Sutton estimated that there were now about three hundred billion feet of available standing commercial timber in British Columbia. He believed that in the past loggers had had too much latitude. Licenses had been taken up here and there in the valleys and an unsatisfactory patchwork of the province had resulted. His own view of the matter was that timber allotments should be made in such a manner as to secure solidity of character. Further than this, he considered it wrong to allow the logger to pick out the choice trees. The eastern system of logging was not applicable to British Columbia. All classes of trees had to be logged at the same time to prevent danger and waste, leaving nothing larger than a 12-inch minimum butt standing. Jack pine alone would spring up after bad fires and if the land was not replanted this weed of the forest would soon obtain control. He suggested that fire swept areas or areas which had been cleared, should be planted with white pine. He also thought that a general provision should be made for dealing with pulp mills, and the Government should not be called upon to make particular arrangements with particular companies. He was emphatically opposed to permitting the export of cedar logs to the United States, claiming that Washington mills were running short of their raw material, and if the Government persevered in their timber protection policy the mills of Washington would ultimately have to move to British Columbia. This would never be brought about so long as the export of cedar or any other timber in the log was permitted. The loggers had been well aware of conditions when they put their logs in the water and could have held them standing at an ultimate greater profit. British Columbia timber was now in a transition stage and daily becoming a more valuable resource as the general timber famine throughout the United States made itself felt. Mr. Sutton expressed himself as strongly against the timber license system as putting the Government in the position of financing the timber speculator. Instead, he advocated actual sale outright with certain safety guarantees.

New Forest Reserve on Slope of Rockies

The entire slope of the Rocky Mountains from the international boundary northward to a short distance north of 54th parallel of latitude is now reserved from settlement or occupation, and will be administered entirely with a view to the proper utilization and reproduction of forest protection of the water supply of the prairie provinces and related objects. This is the effect of an order-in-council just passed by the Dominion Government. The total area of the district now reserved from settlement along the eastern slope of the Rockies in Canada is about covered to a large extent by forest, which is of great value for the supply square miles similarly reserved by the United States Government and known as the Glacier National Park.

Of the area reserved in Canada the Rocky Mountain park (an area of 4,500 square miles) Jasper Forest park (area 5,000 square miles) and Waterton Lakes park (54 square miles in extent) have been reserved for some time. The area now put under reserve for first time is thus about 4,850 square miles (3,100,800 acres). The entire area, 14,400 square miles, comprises an area over two-thirds the size of Nova Scotia. The most northerly boundary of the reserve is situated between 40 and 55 miles north of the latitude of Edmonton, and about 100 miles to the northwest of Yellow Head Pass. The western boundary of the reserve is the boundary between the provinces of Alberta and British Columbia, i.e., the crest of the Rockies, and the eastern boundary is an irregular line fixed by the order. The width of the strip set aside varies from ten to thirty miles from the international boundary up to the latitude of Calgary, and from there northward widens out to from 30 to 50 miles and continuing almost to the northernmost boundary

The lands included in the tract are for the most part elevated and rocky, and generally not suited for agriculture. The area, however, is 14,400 square miles. Adjoining this to the south is an area of 1,400 of wood and lumber to the prairie country lying eastward from the base of the mountains and for the requirements of coal mines and the protection of the sources of the main streams of the central west. On the additional 4,800 square miles just reserved, the effect of the reservation will be to witidraw the lands from homestead entry or sale, and the timber from disposal under license, and it is intended to withdraw the resources of the area from use. For hunting and trapping it will be necessary to have a permit.

Miscellaneous News from Western Canada

The latest official returns place the output of British Columbia fir timber and lumber at 648,000,000 feet, board measure, at $14 a thousand. This does not include the $1,500,000 worth of shingles, and almost $250,000 worth of lath. While this is only about half the output of Ontario, the Ontario output is consumed more in smaller contracts. During the last year the railways of Canada bought about 14,000,000 cross-ties, for which they paid over $5,000,000, at an average price of 40 cents each.

The second annual session of the Pacific Logging Congress will be held in the Forestry Building, Portland, Ore., on July 21, 22 and 23. The objects of the congress are to promote an exchange of ideas, to develop fellowship and good feeling, to record experiences and improvements in the engineering of logging, and to cement the bonds of fraternity among those engaged in the ludustry. The officers are: E. P. Blake, president, Seattle; Frank H. Lamb, vice-president, Hoquiam, Wash.; Geo. M. Cornwall, secretary-treasurer, Portland; Executive Committee—British Columbia, Arthur J. Henry, Vancouver; California, W. W. Peed, Eureka; Idaho, William Deary, Potlatch; Oregon, J. S. O'Gorman, Portland; Washington, J. F. Ives, Seattle. A long list of addresses on matters of interest to loggers will be included in the programme. A. J. Hendry, of the British Columbia Mills, Timber & Trading Company, Vancouver, will speak on "Logging in British Columbia."

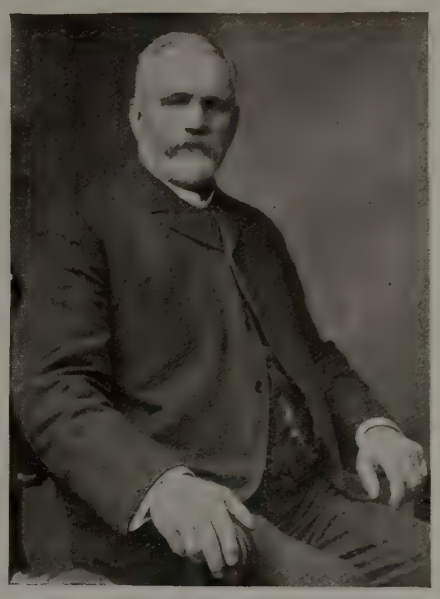
Mr. Otto Lachmund, general manager of the Arrow Lakes Lumber Company of Arrowhead and Revelstoke, B.C., reports the sawmill busi-

ness in the interior to be in a very flourinshing condition. "Formerly," he said in a recent interview, "the mills of the interior had something like a struggle to obtain recognition, but now things seem to be coming their way. Speaking for my own firm, the increased demand for lumber on the prairies has made an open market for all that the mills of the interior can supply. Buyers have made contracts for later delivery agreeing to pay any advance in prices that may be decided upon by the mill men between contract and delivery." Mr. Lachmund contrasted the lumbering conditions in Nebraska, Iowa and Kansas, and remarked that British Columbia has an assured future, the outlook for trade never having been so bright. Mr. Lachmund predicts that on account of the ample water power supplies in the interior and on the coast, the time is not far distant when the mills will electrify all their power plants.

Mr. James W. Davidson, president of the Crown Lumber Company, Limited, in an interview upon the lumber situation in Alberta, states that the shortage in building materials shows little sign of improvement. Owing to the early spring, with warm days and cold nights, the snow melted gradually, and consequently the streams did not reach the height necessary for the successful driving of logs. The output of several camps, therefore, was considerably reduced. Meanwhile the demand was larger than ever and labor scarcer and more expensive than last year. Although the mills offer from $2.25 to $3.50 per day for unskilled labor, they cannot obtain sufficient help to operate at full capacity. This is due to the great amount of work everywhere and the inclination of laborers to work in cities.

The mountain mills have made a further increase of $1 per thousand in the wholesale price, with prospects of a still higher price if the situation does not improve. Stocks of dry lumber are badly broken and some mills will try to cope with the situation by paying extra freight, and shipping this year's supply out while still green. Despite the difficulties mentioned, the total output of western Canadian mills will be greater than last year, and as there is much building activity in all centres, the summer's production can scarcely meet the demand. Railway construction contracted for, totally some $30,000,000, will also consume a great deal of lumber, decreasing the amount which would ordinarily be available for the retail market.

The deal between the Esquimalt & Nanaimo Railway Company and the American Securities Company of New York, negotiations towards which were started last year, is reported as finally concluded. The project involves the construction of 23 miles of railway from tidewater to the site of the timber limits on Cowichan lake, and the transfer to the New York company of some 54,000 acres of timber land. The railway is to be completed and ready for operation next year. The sawmill will be built and operated by the Empire Lumber Company, a subsidiary company to the Securities syndicate.



The timber lands are all tributary to Cowichan lake, and when logging is started the timber will be rafted and towed from the points where it is put in the water to the foot of the lake, where it will be loaded on flat cars and carried over the railway to the mill to be erected at tidewater. In this latter connection persistent rumors were afloat last fall to the effect that Crofton had been chosen as the site for the mill. H. Kurtz, president of the American Securities Company, in several interviews with the "Times" last summer, said that the company would create a considerable town at the site of the mill, and that therefore such point would have to be of a character to permit of houses being erected for the families of the workmen who will be employed at the mill.

An Interesting New Catalogue

The Canadian Fairbanks Company, Limited, have just completed their general catalogue, which will be ready for distribution on July 1. The catalogue is an artistic production and should prove of general interest to every manufacturer and purchasing agent throughout Canada. It is profusely illustrated and shows the many and varied lines handled by the company. The catalogue is divided into the following sections: Fairbanks scales; electrical apparatus and supplies; pumps, steam, belt and gasoline; valves and steam goods; railway and contractors' supplies; small tools and supplies; power transmission appliances; safes, vaults and metal office furniture. In addition to the general catalogue, small sectional catalogues as listed above the being issued. The general catalogue consists of approximately 1,200 pages. A heavy coated paper is used in both the general and sectional catalogue, so that all engravings are shown up to best advantage. The general catalogue is bound in cloth cover, the sectionals in heavy cover stock, richly embossed. As a reference book it will prove of much value in every manufacturing plant. A glance through its pages will bring to mind stronger than ever the position occupied by the Canadian Fairbanks Company, Limited, as Canadian distributors. A copy of this catalogue will be mailed free to those who are interested in receiving it.

Capt. W. B. Sifton, of Swan River valley, Alta., Government forest ranger, reports that the fires about May 27 were not really so destructive as at first reported. While not professing to give an accurate estimate, he thinks the total losses, instead of aggregating a million dollars, would be approximately covered by half a million.

Archibald Leitch Suddenly Called

The Late Archibald Leitch

The death occurred on May 30th, at his home in Cranbrook, B.C., of Archibald Leitch, president of the East Kootenay Lumber Company. The news of his sudden death came as a startling shock to his large circle of friends. He was about to remove his coat to go to lunch when he fell to the floor. When his son, Archie Leitch, Jr., lifted him up he was dead. He had been in poor health for some time and intended going east for medical advice the day after that upon which he died.

Mr. Leitch was one of Canada's veteran millmen, was well known in his youth in Ottawa valley district, where he first commenced lumbering. He moved to the West in the pioneer days, following the railway into the mountains in 1887, and transporting his sawmill from Golden to Cranbrook over almost impassable trails. He was a man of sterling qualities and greatly respected by all whom he met.

Mr. Leitch was the founder of the lumber business in East Kootenay. In partnership with his brothers, of Oak Lake, Man., and his brother-in-law, James Mundie, of Montreal, he erected the first permanent lumber mill on St. Joseph's creek, about a mile and a half from Cranbrook. In a short time this concern was found too small for the growing business, which was carried on under the name of the Cranbrook Lumber Company, with a capital of $20,000, and new mills had to be erected on a greatly increased scale. Again, the expansion of the business required an increase in productive capacity, with the result that the mills at Jaffray and Loco, now running night and day, had to be erected. As long ago as 1902 he conceived the idea of amalgamating all the lumber mills in the Crow into one company to handle all the timber comprised in the British Columbia southern land grant to the C.P.R., an area of 3,700,000 acres. This plan—now recognized as easily feasible.—met with opposition in some quarters and ended in the Cranbrook Lumber Company, the Park-Mitchell Lumber Company and the McNab Lumber Company uniting to form the East Kootenay Lumber Company, of which he was the head.

Mr. Leitch was 62 years of age, and leaves a widow, four daughters and three sons.

Important Hardwood Inspection Agreement

On May 31st an important conference was held in New York City at which a definite arrangement was reached in connection with the inspection rules for hardwood lumber. The following organizations were represented: The Eastern Retail Lumber Dealers' Association, the New York Lumber Trade Association, the Hardwood Manufacturers' Association of United States, and many individual interests. The grading rules of the Hardwood Manufacturers' Association were taken for the basis of the agreement. They were carefully gone over and after a number of changes had been made, were adopted. In a general way the changes decided upon were as follows:

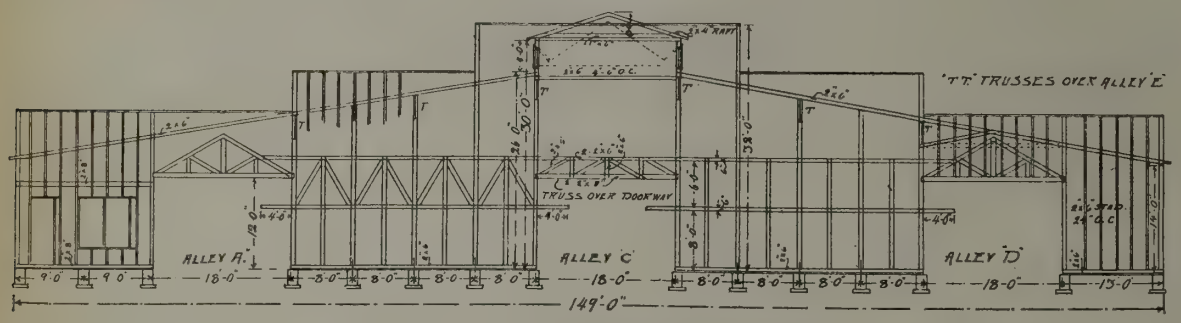
1. When the question of grade only is in dispute, only that part of the shipment intact, complained about, may be held, but when the question is one of quantity, the entire car must be held intact until an agreement is reached.

2. The standard rough thicknesses were adopted as shown by the book and to this was added that 10 per cent. of the shipment may be 1/16-inch scant of the standard thickness.

Another important change was to define the percentages of firsts in the combined grades of firsts and seconds of different kinds of lumber as follows: Poplar, 50 per cent.; basswood, soft elm, Mexican mahogany, and cottonwood, 30 per cent.; African mahogany, 35 per cent.; white ash, birch, hard maple, chestnut, sycamore, red and sap gum, 33⅓ per cent.; soft maple, brown and black ash, Cuban mahogany, 25 per cent.; beech, butternut, rock elm, hickory, pecan and walnut, 20 per cent.

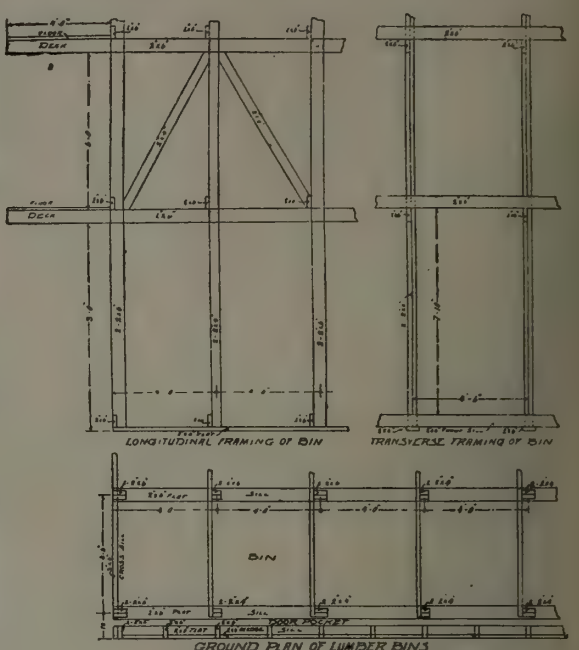
It was argued by the eastern lumbermen that the percentage of short lengths admitted by the rules was not entirely in line with the requirements of buyers, accordingly the percentage under 10 feet was reduced.

The grading rules as adopted by this conference are to remain in force for five years.



J. W. Turnbull, lumber dealer, Asquith, Sask., has sold his business to R. G. Fletcher.

The Retail Dealer and His Problems

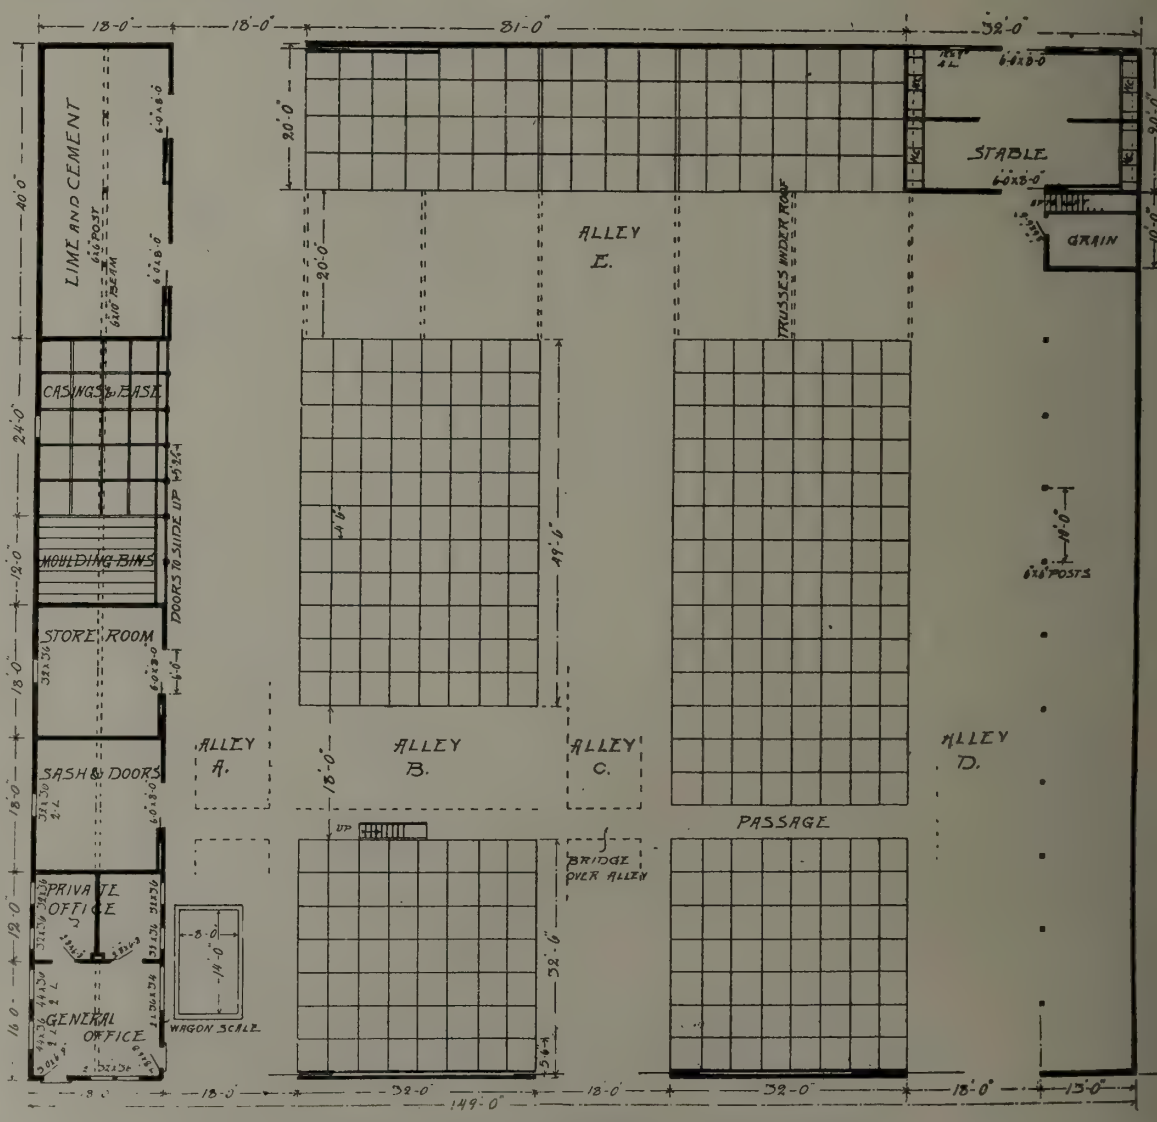


Plans for Lumber and Building Material Sheds

SIDE ELEVATION

FRONT ELEVATION SHOWING CONSTRUCTION

DETAIL OF LUMBER BINS



A Retailer's Office and Storage Buildings

The accompanying plans will be of interest to those who have occasion to handle and take care of lumber and building material stocks, and also those who are called upon to plan or construct buildings of this kind.

This building was erected for a retail dealer after plans prepared by himself. It is stated that the building was built with very little deviation from the plans and has proved to be an entire success. The bins for finish lumber, which are closed up tight and keep the stock in the very best condition, have been especially satisfactory.

The owner, a lumberman of many years' experience, says that if he were to build another building of this class, he would not know how to please himself any better than to copy this one.

The cost of the building at the time of its erection in 1904 was about $4,500, and it houses a $30,000 stock of building material of all kinds in the very best of shape, every article of which is accessible and readily loaded upon wagons. This stock includes a general lumber stock, sash and doors, lime, cement, brick, etc. The drawings show the general arrangement of the storage bins and the method of construction.

Ground Plan, Lumber and Building Material Warehouse

Belt Lacings

I have in use four different kinds of belt lacing, which we will place in three classes, i.e., for belts working in dampness, for belts working in a temperature of 120 degrees heat and over, and for belts working in dry places and in normal temperature. Regarding the first, I use mostly rubber belts with rawhide lacing. I have found iron and steel clamps to be absolutely useless for any belt that is wet. The same applies to belt-lacing machines using wire, the principal trouble being where the clamps or prongs pierce the belt, as rot is likely to set in and necessitate cutting out a piece of the belt in a short time.

Regarding the second type of belt, I have several working in a temperature of from 150 to 200 degrees. I have tried lacing with rawhide clamps and also machine spiral belt lacing, the latter being the best for leather belt, as the rawhide lacing soon dries up and breaks, while clamps burn and tear the belt. A good canvas-woven belt has given me better results than leather in such heat, but it was a case of using rawhide lacing, as the spiral belt lacing has a tendency to unweave one end of the belt and in time pulls out and leaves a very ragged end.

For ordinary running belts I use principally leather, the best lacing for which I find to be the spiral lacing. By sewing on the machine and sinking the lacing in the belt, a perfect joint is obtained, and the belt is able to run on a smaller pulley than would be possible with clamps.

I have several leather belts running at a very high speed which are

laced by hand with wire lacing and sunk into the belt with a hammer. When using spiral lacing on these belts I find the hinged joint wears too fast.

I have also had excellent results with canvas-woven belts in damp places by using metallic lacing. I generally lace them three-quarters of an inch from the joint, and for leather belts, from 10 inches to 24 inches. I have one 20-inch belt driving a 120-kilowatt generator. The driving pulley is 104 inches in diameter and operates at 140 revolutions per minute. The driven pulley is 20 inches in diameter. From centre to centre of the shafts is 12 feet. I think this is rather severe service on such extreme pulleys and short centres of shafts, as the belt must be kept very tight, yet the metallic lacing has been in two years and given no trouble.

Fuel End of the Retail Business

"The Fuel End of Our Business" was the title of an address by Mr. A. W. Robinson before the Western Retail Lumbermen at their recent convention. Mr. Robinson said: While studying the question it occurred to me if I were to change the title a little I could get up a better paper, and so I decided to change it to read, "The Business End of Our Fuel."

We sell coal, cordwood and slabwood. The coal and cordwood is handled so nearly in the ordinary way that the details and our methods would not be likely to interest you.

Owing to the shape of the ground we have our coal sheds on, it is not a very up-to-date shed. However, it keeps the coal covered and we get along very well. Its shape is a triangle, the base 60 feet, the perpendicular 80 feet, and the railroad the hypothenuse. There is quite a large portion of the shed that we are compelled to fill with wheelbarrows. It costs 12½ cents a ton to unload.

We handle a great amount of cordwood, and we find that quite a pulling power when it comes to selling. We have to pay 50 cents for sawing from the car, and charge $2 more a cord for the sawed wood than for four-foot wood. It is worth that much more considering the cost of extra labor and shrinkage. We give a full cord of sawed wood. We charge the man who comes to the yard and hauls the wood away the same as we do where we deliver it, as we find that the man who hauls his own wood will get enough more wood to offset anything you save in labor.

I am aware that in some sections it may be customary to sell short cords of wood to allow for shrinkage, but we think it better to sell a full cord and charge enough to cover the difference in measurement.

The customer may say, "He charges a big price," but he will have to add, "He gives good measure."

I have now come to what I call "The Business End of Our Fuel" —Slabwood.

My reason for calling it the business end is that the slabs are a by-product of the mill and it is good business to sell stock which accumulates around a mill so that all the product of the log may be put to good use and not wasted.

We are fortunate in one point, regarding our slabwood—there is no bark on it (I do not mean by this that bark is not good fuel, but have reference to the selling quality and drying quality of the wood), as we find that our argument about the waste in splitting makes good with most people. Owing to the way we handle the wood, the drying feature is a great point. We use a machine that cuts four-foot slabs into three pieces at one operation; it is fed with a chain feed and has an extension table that reaches into the car.

When things are running smoothly, it keeps two men very busy feeding the machine fast enough to make the saws cut any way nearly full time.

The wood is carried in an elevator that deposits it in a pile 40 feet high at the apex. This pile will accommodate about 550 cords. You can readily see that drying qualities are a very important point. Our slabs dry out bright and sweet and look very nice when they come out of the pile.

Sometimes we get a few slabs that have the bark on them and we find that these slabs are practically as wet when we come on to them in the pile as they were when sawed. Not only that, they damage the ones lying near.

We use a 20 horse-power motor to run the machines and elevator, but intend to put in a separate motor for the elevator the coming season, as many of the slabs are too large for the power we now have.

In delivering, we have used the ordinary wood rack and have corded the wood up in it. We find this a very expensive way to handle the wood and are considering having some dump carts large enough to hold a cord when piled in on the ground. We will then throw the wood in and dump it at the place of delivery. By having a number of these carts and having an extra man to load, we can in a rush get rid of a lot of wood with one team and save on the present cost of handling.

I have said nothing yet about the profit. There is something you cannot get around—you have to sell at a price that includes a profit or you won't have any.

Now we conduct our business on the theory that our stock is as good as anyone's else; that we are entitled to a profit for being in business, and we ask it, and what is more—get it. I am going to give you a tip now: If you have the right kind of slabwood and handle it properly you will find it a very nice side line, particularly in times when building material lines ar dragging.

Now to sum up the fuel question. We have found—

1. It pays to get the best fuel you can obtain;
2. It pays you to give full measure and charge for it;
3. That prompt delivery and good stock will draw the better class of trade, regardless of price;
4. That you cannot afford to have any terms other than cash on your fuel; and,
5. That if you live up to the other four, you will get and hold a fair portion of the business and your trade will grow continually.

Three don'ts.

Don't take orders that you cannot fill when promised.

Don't fail to send goods fully up to the quality you sold.

Don't forget to say: "Did you want to pay for it now?"

That puts it up to them to either pay or give a good excuse for not doing so. Of course—if you see them reaching for the money, this won't be necessary.

Planing Mill Work

By George E. Gary

There are but few of us who know, in the fullest sense, what a planing mill is, and I am not of those few A wise man, indeed, in his day and generation, is he who can run a planing mill successfully. It is very simple, though, once you learn how.

Get the best town you can find, where you can get an insurance rate of 1 per cent; get the best foreman you can find, one that doesn't ask for solid time; get the best crew you can find, that will work twelve hours if you ask it; the best machines, the best material, the best line of customers (the kind that don't kick); the best railroads (that kind that pays for all breakage and that will let you ship sash in the same carload at dressed lumber rates). Have a dust-arrester and a planer that will make just enough fuel to run the boilers without coal, with no trash left over, and where the exhaust will make it just warm enough in the shop in zero weather and not one degree too high on milder days. Have a clock that doesn't slow up in the night and get all the move on at 11.30 a.m.; a whistle that stops automatically when a nearby citizen thinks "damn." Easy, isn't it? Isn't it beautiful? Yet, I say unto you, that Solomon in all his glory could never run one like unto the above.

You might have the best dry kiln on earth; beware, it may be too good. The worst kick I ever had was on a bill of fine oak finish for a residence. It was shipped out bone dry, put into a brick house with green walls, and the panels swelled and burst the stiles and rails apart on $10 doors. Whose fault was it? Mine, of course. They swore the lumber was green. Have had the same thing happen to costly cabinet mantels, which the customer put up against green chimneys. Whose fault? Same against same. The most logical and rhetorical letter I ever wrote was to convince a customer that excessive dryness was not a defect in lumber, but the said customer carried his point.

The planing mill operator runs a charity bazaar—a kind of correspondence school. He has to educate every man who builds a house, initiate him into woodcraft. The trouble with house building, as you know, is that the owner seldom gets the benefit of his own experience. So few of them build twice, and the poor planing mill man (P.M.M.) foots the knowledge bill himself.

Did you ever have a fellow write you rejecting an entire house pattern because the door stops were planted on, even though it gave him a thicker jamb, by the depth of the rabbet? Again, Y.P. means yellow poplar instead of yellow pine, if you happen to send yellow pine, and the fellow who ordered the door "P.G., 4 panel," didn't want "P.G. sticking," but wanted primed and glazed, of course, and wanted it painted one coat and glazed with bevel plate.

So, know all men by these presents, that the P.M.M.'s life is not a happy one, that there are other ways of getting rich and serving the Lord.

Let a "big stick" panic strike the country and the planing mill proves the most sensitive business in the land. Residences immediately become catalogued as luxuries that in a pinch can be dispensed with. and new business houses and plants are not wanted, for there is not enough business for the old ones.

Once the night rider gets abroad in the land, and down goes planing mill stock again with a dull sickening thud. Nobody wants to build houses to be burned by mobs and have their fire insurance contracts repudiated by Mr. Underwriter.

I had $8,000 worth of orders cancelled in one week after the burning of the depots along the I. C. Railroad. If a local crop fails, the planing mill first feels the effect of it, and it looks as if there's nothing that gives a man a keener appetite for bankruptcy than to get in debt to the poor P.M.M. Fire, wind and water are the sworn enemies of the P.M.M., and on account of the terms he is on with the fire fiend, he is liable to be given a back seat by R. G. Dun.

However, there are some bright spots in the checkered career of the P.M.M. All the putty does not drop out of his sash. The late J.

K. Forbes, a senior partner, who was the sawmill man of the firm, upon being asked which he liked best, the fiddle, the piano or a brass band, replied that neither was to be compared to a sawmill. The merry song of the planer makes Damrosch's orchestra sound like cats fighting, and the smell of poplar shavings is sweeter far that the costliest scents on my lady's dressing table. Occasionally the pleased smile of a satisfied customer brightens his pathway, and now and then the balance shows up on the sunny side of the ledger.

The modern floring machine that can match and end match, dress, polish, sand-paper and dust off a carload of hardwood flooring in a ten hours' run makes sweet music to the ear of the owner, but all the same. it chants a requiem over the passing country planing mill.

I repeat, it takes a versatile genius to make a successful P.M.M. He must be a judge of lumber and of men, a master mechanic and machinist, a good mathematician, a shrewd buyer and seller, a high type of executive, an early riser and a late worker, a patient man, a sober man, an honest man. Scarce.

Buying for a Retail Yard

"Buying for a Retail Yard," was the subject under discussion at the meeting of the Western Retail Lumbermen's Association, and after the reading of an interesting paper by one of the members, Mr. J. C. Weeter opened the discussion with the following practical talk:

During the reading of the paper several thoughts came to my mind —matters that have agitated me and some of my friends in the retail business a good deal, in the last year, and one is the matter of stock. Another is the matter of varieties or different patterns of stock carried, or to be carried, by the retail dealers. Now I find that a great many retailers are disposed to be extravagant in the number of patterns of, for instance—rustic or its substitute, flooring, etc. Now in our section of the country we carry, or rather are supposed to carry, eight inch channel stock, and in other sections of the country they use drop siding. Some carry 8-inch channel rustic in the No. 1 and No. 2 grades; 6-inch in the No. 1 and No. 2 grades, and in some yards, I find that they carry the novelty rustic in the No. 1 and No. 2 grades—6-inch, also in some yards they carry the drop siding—6-inch in the No. 1 and No. 2 grades. That makes about eight or nine different kinds of siding or rustic that some of the yards in our section of the country are carrying at this time. Now I want to say to you gentlemen, that I do not believe that this is good business policy and I do not believe that it is absolutely necessary to carry more than four or five kinds of rustic or drop siding, or exterior covering of that kind. When we carry a large number of patterns of the various grades, we are materially increasing our investment. I believe this can be eliminated by the dealers in the various towns getting together and agreeing upon just what they will carry. If we do not do this and our competitors put in drop siding, and there is some little demand worked up for it, then we are obliged to put it in and the next thing you know some one is going to go one better and put in something that is not carried. Now I think this is a matter of the most vital importance to the retail dealer. I think it is good business management on the part of the retail yard to keep stock down to a minimum investment in order to make satisfactory profits. By putting in these various lines of rustic you very materially increase your stock and your investment, taxes, insurance, etc., but you do not materially increase your business. I would therefore urge upon you that in order to get the best results from your retail business, you should keep down so far as possible, the different varieties of the different articles that you handle. Now, then, in regard to flooring, I find that in our section of the country we carry No. 2 and No. 3 four-inch V.G. flooring. Many of us carry No. 2 and No. 3 slash grained flooring in the four-inch. Now I do not believe this is good business. I do not believe we ought to do that. The difference between No. 3 vertical and No. 4 slash grained is so small that one will answer in almost every instance for the other, and I do not believe it is a good idea to double up on them. I believe the yards ought to adopt the policy of handling one or the other, in every town or community in which they operate. Another matter I would like to mention in this connection is this: we find from experience that the mills manufacturing the standard grades of stuff in this section of the country do not manufacture uniform grades. In a number of instances where we are ourselves sending out ceiling on jobs from three different mills, we find each of them differ. We have sent out flooring from different mills which would not match. I have seen floors as large as this room that had to be re-planed and re-surfaced in order to have smooth surface. Now this is wrong, and shows a lack of consideration for the retail men, on the part of the sawmills of the country. I think we ought to urge to the best of our ability upon the manufacturers that they get together and that they manufacture uniform standards.

Mr. W. R. Smyth, M.P.P., who has large lumber interests in the district of Algoma, in a recent interview expressed himself as being in favor of reciprocity with the United States, but he would not for one moment consent to endanger the industries of Canada to obtain that benefit. "Our interest in reciprocity," he said, "is confined almost entirely to lumber. We would be very glad to get our lumber into the United States free of duty, and consequently we are in favor of a certain amount of reciprocity. I would be absolutely opposed to any terms which would endanger Canadian manufactures. The Americans have to take our lumber anyway. As a result of the policy of the Ontario Government, in prohibiting the export of timber from Crown lands, they came over and built their mills on our territory. Now they own 90 per cent. of the larger mills in our part of the province. Of course, they, as American citizens, are strongly in favor of reciprocity in lumber. There is not one-seventh of the total cut of Ontario which is exportable under the regulations. The patented lands have been largely exhausted, and consequently almost all the timber comes from Crown lands. This makes our position in Ontario specially strong."

Personal News of Interest to Lumbermen

Mr. Jas. Keenan, of the well known firm of Keenan Bros., Owen Sound, was in Chicago the past week on a business trip for his firm.

O. H. Robertson, of St. Paul, Minn., is looking into the lumber business in Winnipeg. Mr. Robertson is chief shareholder in the Union Lumber Company, St. Paul, Minn.

Mr. J. L. Campbell, of Campbell & Johnson, Toronto, is on a trip to Manitoba to visit his western yards and other interests. He will probably extend his visit till the end of June.

J. A. Robertson, son of Wm. Robertson, of the Rat Portage Lumber Company, Vancouver, B.C., is among the coasters who have gone to the new mining camp at Stewart, B.C.

Mr. Guy H. Long, of the Long Lumber Company, Hamilton, Ont., will continue the business formerly carried on under the same name by himself and his brother, M. S. M. Long, whose sudden death recently was the cause of widespread sorrow among his numerous warm friends in the lumber business.

Mr. C. G. Anderson, Toronto, has recently opened an office at suite 112, Manning Chambers, where he is manager of the Ontario branch of the British America Mills & Timber Company, Limited, of Winnipeg. The company are doing an extensive business in Ontario as Mr. Anderson is well known to the trade as a successful business getter.

Mr. John Diver, the well known lumberman of Sarnia, Ont., was painfully injured in an automobile accident near Galt on Saturday, June 4. The machine skidded and, striking an obstruction, threw Mr. Diver out over the front. His chest was bruised and it was feared he was internally injured. He took the train immediately for Sarnia.

Several members of the Faculty of Forestry of the University of Toronto have left for Calgary, where they will engage in surveying the boundaries of the forest reserve on the eastern slope of the Rocky Mountains for the Dominion Government. The party is composed of the following: Mr. G. H. Edgecombe, C R. Mills and W. J. Vandusen, of Toronto, and Mr. A. Belyea, of the forestry department of the University of New Brunswick.

Dr. Fernow, Dean of the Faculty of Forestry of the University of Toronto, has returned from Nova Scotia, where he started the party of foresters upon the reconnaissance survey of the eastern part of the province. It is expected this will be completed along with Cape Breton by the end of September. In Halifax, Dr. Fernow saw Hon. A. K. Maclean, Minister of Crown Lands. who looks forward to most satisfactory results from this survey It is likely a forestry convention will be held in Halifax during the coming winter to acquaint citizens with the need for a progressive forest policy. Dr. Fernow will remain in Toronto until about July 1st. when he leaves for Europe to study recent developments in England, France. Germany, Switzerland and Sweden. and to attend the meeting of the International Association of Forest Experiment Stations at Brussels, Belgium.

The body of John McLean, lumber agent, of Ottawa, was found floating in the Ottawa river at Pembroke on June 9th. The deceased was connected with the Manufacturers' Lumber Company, a recently formed Ottawa firm with New York connections, and went to Pembroke on May 26th to buy lumber. The late John McLean was a well known figure in Ottawa lumber circles. For many years he was agent for the Colonial Lumber Company, of Quebec, and left their employ to become agent of the Manufacturers' Lumber Company. He was 45 years of age and was born in Quebec. He leaves in Ottawa a widow and two children, a son and a daughter.

J. A. DesRivieres, whose planing mill in Ottawa was burned on May 27th, is a loser to the extent of $26,000. The property was considered to be too great a risk for insurance men, and they had refused to cover it. The destructive blaze had its origin in the drying kiln. Half a million feet of lumber were burned and $12,000 worth of machinery. Ten dwellings near by were also burned. Fraser & Company, of Deschenes, lost a stable through fire on June 3, the loss amounting to $2,000. The mill was protected by the company's own equipment. A curious sequel to the last of two fires within a month in the Shepard & Morse lumber yards is the prosecution of a youth for setting the latter fire. The loss in the two fires amounted to about $5,000.

Telegraph Poles in Good Demand

Electric Distribution and Railway Companies Buying Large Quantities—Prices Advancing for Long Sizes

The brisk demand for 35 and 40-foot telegraph poles in the Ottawa valley keeps the ruling high prices firm. The 25 and 30-foot lengths are more plentiful and quotations are proportionately moderate. The longest variety are so difficult to procure in any large quantity that holders can practically make their own prices. There is a wide variety of opinion as to the future of the pole market. United States customers have been buying 35 and 40-foot lengths in such large quantities that an advance is likely to take place. These are the sort much used by local electric companies also. There is frequently a wide margin in the prices received by a company which advertised for a limited number of poles, 7-inch top, delivered in the city: 30 feet long, $2.40; 35 feet long, $3.50; 40 feet long, $4.80; 45 feet long, $6.10; 50 feet long, $8.50; 55 feet long, $10.50. The two latter quotations are low compared with wholesale quotations, but it is learned that the tenderer did not propose to fill the order in respect of these two varieties. Other instances are quoted by dealers when asked to tender for supplies. A conclusion as to wholesale rates may be drawn from the following figures in a tender given here where poles could not be supplied at prices in outside markets.

Wholesale prices of ties and poles at Ottawa are as follows:

Standard railway ties, 6 inch	0.45 to 0.50
Mill run cedar ties	0.38 to 0.45
No. 2 railway ties	0.25 to 0.30
Cedar telegraph poles, 25 feet long, 6-inch to 8-inch top	1.00 to 1.50
Cedar telegraph poles, 30 feet long, 6-inch to 8-inch top	1.75 to 2.50
Cedar telegraph poles, 35 feet long, 6-inch to 8-inch top	2.50 to 4.00
Cedar telegraph poles, 40 feet long, 7-inch top	4.25 to 4.75
Cedar telegraph poles, 45 feet long, 7-inch top	5.25 to 6.00
Cedar telegraph poles, 50 feet long, 7-inch top	9.00 to 10.50
Cedar telegraph poles, 55 feet long, 7-inch top	11.00 to 13.50
Cedar telegraph poles, 60 feet long, 7-inch top	16.50

The demand for telegraph poles at Toronto is exceptionally strong and the supply is very small. Last winter very few poles were taken out, because of the difficulty there had been in selling poles for several years previous. The result is that supplies have been greatly depleted by the good demand now existing. The city of Toronto has bought 4,000 poles already this year, and have reported that they will soon need 20,000 more. These are being used for the Hydro-Electric power distribution. Wholesale prices at Toronto are as follows:

Telegraph poles, 30 feet long, 7-inch top	$ 2.00
Telegraph poles, 35 feet long, 7-inch top	3.00
Telegraph poles, 40 feet long, 7-inch top	4.00
Telegraph poles, 45 feet long, 7-inch top	5.25
Telegraph poles, 50 feet long, 7-inch top	7.00
Telegraph poles, 55 feet long, 7-inch top	9.00
Telegraph poles, 60 feet long, 7-inch top	12.00

At Quebec shipping points, telegraph poles, in 30 and 45-foot lengths are not in active demand and show no tendency to advance. 35, 40 and 50-foot poles with 7-inch tops, on the other hand, are finding a ready sale and are now commanding much higher figures than heretofore. Prices for telegraph and telephone poles are quoted as follows, f.o.b. shipping points in Quebec:

Ties—Standard railway ties, 6-inch	$0.45 to $0.50
Mill run cedar ties	0.38 to 0.45
Telegraph poles, 30 feet long, 6-inch top	$2.25 to $2.50
Telegraph poles, 35 feet long, 7-inch top	2.75 to 3.00
Telegraph poles, 45 feet long, 7-inch top	4.50 to 4.75
Telegraph poles, 40 feet long, 7-inch top	3.50 to 3.75
Telegraph poles, 50 feet long, 7-inch top	10.00 to 11.00

Lumber Matters in the Law Courts

Interesting Decision Regarding Delivery by Railway —Emmerson License Cancellation to be Fought Out

Workman's Compensation—An interesting and important case regarding the Workmen's Compensation for Injuries Act is before the courts in British Columbia. Application has been made in the Supreme Court for the appointment of his Honor, Judge Howay, as an arbitrator under the Act to fix the amount of compensation due to Jacob Ward, a planerman from the Fraser River Mills, who had his hand damaged. The application was opposed on the ground that there was nothing to arbitrate. The Workmen's Compensation Act was not an Act for the remuneration of suffering, but for loss of wages and earning capacity In this case the man was tendered the 50 per cent. of his wages that he was entitled to under the Act during the time of his disablement, but he was now back at work earning as much money as before. The judge recalled that he was in the Legislature when the Act was introduced and he regarded it as a sort of insurance scheme. It fixed a large liability upon the employers and he was very much surprised to see that it was suggested that suffering or future incapacity should be taken into consideration. He thought the Act was only concerned with the difference in the earning capacity. Counsel for the applicant urged that his lordship must take cognizance of the fact that the man's earning capacity had as a fact been diminished, although he had been paid wages equal to those he had received before. They had not put him back at his old work, but had given him work at which they were paying him more than the regular rate of wages and they were doing so in order to defeat the man of his compensation. That question should be allowed to go to the arbitrator. Mr. Justice Murphy pointed out that the common law and the Employer's Liability Act remained, but reserved his decision.

Liability for Delivery of Lumber—A case of much interest to lumbermen, involving the liability of a railway company to deliver lumber on a connecting carrier, has just been decided in a Divisional Court of Ontario before Sir Wm. Mulock, C.J., Hon. Mr. Justice Clute and Hon. Mr. Justice Sutherland. The case was an appeal from the judgment of Hon. Mr. Justice Magee in the trial court, where the action of the plaintiff, Mr. Laurie, a lumber manufacturer of Parry Sound, against the Canadian Northern Railway Company was dismissed. Mr. Laurie sought for loss of profit on a shipment of lumber which the company had carried as far as Selwood, on its way to Gowganda. The plaintiff held that the C. N. O. were liable for delivery at Gowganda and the defendants relied upon the terms of the shipping bill, wherein it was agreed that they did not contract for delivery except upon their own lines. Owing to an accumulation of freight at Selwood, the Gowganda Transportation Company was unable to forward the lumber from Selwood to Gowganda. The railway company thereupon returned the lumber to Parry Sound and repaid to the plaintiff the sum of $643.45 which he had paid them for freight. Mr. Justice Clute, in giving the judgment of the court, stated there had been a limitation of the defendants' liability, under the contract, and he dismissed the appeal accordingly.

Ownership of River Bed—Mr. Justice L. I. Champagne has rendered judgment in the case of Maclaren v. Hanson Bros. in which the ownership of the bed of the Gatineau river was at issue. The plaintiffs are declared to be the rightful and legal proprietors of that portion of the river which was involved in the case. By the judgment the Province of Quebec will be the principal loser, as it precludes the government of that province from selling the extensive water powers along the Gatineau and rivers of a similar character to parties desiring to obtain possession of them for development or for speculative purposes. The claim of the plaintiffs was that they were the owners of those portions of said lots adjoining the Gatineau river; that the river was neither navigable nor floatable, and not a dependency of the Crown domain; that as a consequence the lots of land in question extend to the middle of the river and include the bed thereof, the islands and water powers therein to the middle of said river.

Employer's Liability—The case of R. Macfarlane & Company, Limited, Montreal, appellant, and Burnell, respondent, has been argued on appeal in the Court of Appeal, from the decision given in the Superior Court at Montreal. The case arose over an accident to the respondent, who fell from a ladder, while employed by the appellant. The Superior Court held both parties liable and fixed the damages, one-third upon Burnell and two-thirds upon the company. The respondent claimed that the company had been negligent in providing a ladder without spikes and not furnishing a man to hold it from slipping. The company held that the ladder did not slip, but the respondent turned around and overbalanced it. They claimed also that a spiked ladder was available and the respondent could have used it. After argument by counsel, judgment was reversed.

Cancellation of Licenses—Mr. J. S. Emerson, of the Western Lumber Company, Vancouver, has decided to test the validity of the action of the British Columbia Government in cancelling the licences on two of his large timber limits on a charge of his having exported timber contrary to the Timber Manufacturers' Act. He has continued to cut timber on these limits. The loggers in two of his camps, who worked under his instructions, have all been summoned to appear at Vancouver on June 8. Mr. Emerson is reported as saying that this opportunity to test the matter before the courts is what he has desired, and that he will fight the Government to the end. The licenses of the two limits were cancelled on the evidence of Chief Timber Inspector Haslam.

Writ to Set Aside Sale—The Nipissing Lumber Company have issued a writ against James Turnbull, Henry M. Watson, William Milne, Wm. Milne & Sons, Limited, William Lees, and the Bank of Hamilton to recover $125,000 damages to set aside the sale of the Spanish Mill property and the Cache Bay property, or to prevent completion of such sale, and for an accounting; also for a declaration that the acts of the Bank of Hamilton have been in contravention of the Bank Act.

Mr. D. Murphy, ex-M.P. and president of the Ottawa Transportation Company, sailed on Saturday June 11th, via the "Laurentia," accompanied by his family and will spend some time abroad.

THE WOODWORKER

Knife Combinations

It would seem that the subject of knife combinations could never grow stale to the moulder man, for it is an ever-present problem with him to turn out his patterns of mouldings with the least amount of grinding possible. As has been intimated before, he should have a good assortment of hollows and rounds, straights and bevels which will work on any pattern which they will fit.

In fig. 1 is shown a combination for making a heavy stair rail and the illustration is for a two-run method. Old sticker men need not be told that it is folly to make a full set of knives for every pattern of moulding, especially the big ones having short runs. It takes less time to run the stock through the second time than it does to set up the other side to run it all at once, and then there is the saving of the bits and the time to grind them.

Returning to fig. 1, it will be seen that the rail is intended to be run on its side, the knife A cutting half way over the top, and the knife D cutting the plow for the fillet and balusters in the bottom of the rail. It will also become apparent that the knives A, B and C cut the pattern for the side, as shown by their arrangement. Whether the finishing cut on the bottom of the rail is made during the first or second run depends somewhat upon the condition of the stock to be run or upon the taste of the operator. If the stock has been jointed and sized before coming to the sticker the finishing cut may be left until the second time through, which will be some help if the plow in the bottom of the rail is made with the inside head. It sometimes occurs that in order to use some knives in stock the arrangement assumes an arbitrary shape and we

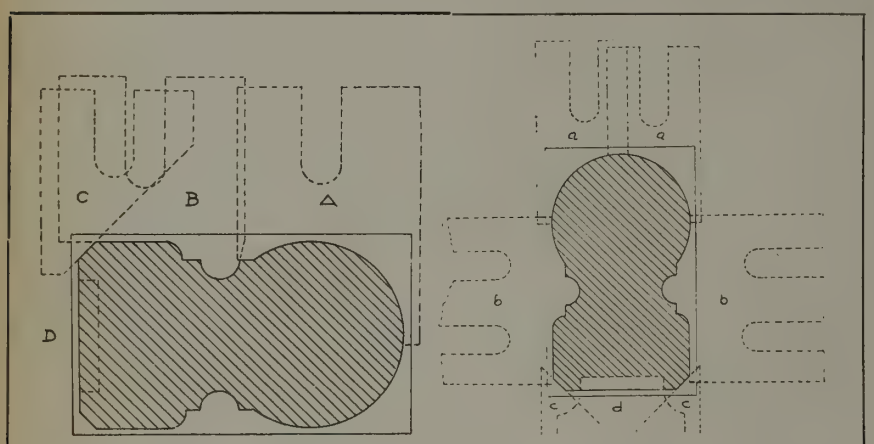


Fig. 1 Fig. 2

have no choice about running the top or bottom to the inside; but a study of the figure will show that if the top of the rail is the inside of the machine, the first cut will not interfere with putting it through the second time and still preserve the alignment of the several members of the moulding. An inspection of the bottom of the rail will show that the surfacing knife cuts clear across the face of the moulding so that if an eighth of an inch should be cut off during the first run, there would be that much of an offset in the cross-section of the moulding, provided the bottom was run next the fence. Now when this becomes necessary the remedy is to take a strip of smooth wood, about as wide as the face of wood to be run against the fence, and plane it to the thickness of the surfacing cut of the side head, and make it long enough to reach back to the inside head. Now saw away a strip from the edge of this piece nearly to the end, the object of which is to hook against the front end of the bed of the machine and keep the fillet from feeding through with the stock. When this is inserted by the side of the piece from which a cut has been taken, it will keep it cut to its original position so that the section of the moulding will show a balanced arrangement of the members.

Fig. 2 illustrates a set-up for the same rail as fig. 1, with the additional difference that it is arranged to cut the whole pattern at a single run through the machine. If this should be a stock pattern so that large quantities of the same size and shape are required, it would be economical to fit up for the single run.

Studying the figure, we find that the top of the rail is made by means of two quarter-round knives, a and a, and could be made with a full round knife, although the latter will continually grow larger with wear, and unless it is persistently ground along its whole edge will soon become unfit for use on this particular pattern. The quarter-round knives can always be brought to place, and while it requires more care in setting, they may be used on any other job having a quarter-round detail of that size. In this run there is no separation of the knife cutting the side below the centre of the head of the pattern, although it may be made up of smaller members, such as the side head will hold. The knives b and b are rather large; but as the setting of the side is not so easy as the top, it will help some in that way to have them solid. On the bottom head are the surfacer, which should balance d, and the level cutters c and c, which should have each a balancer of its own. For the reason of good balancing, the moulder man should have a good assortment of bevel cutters, among them some as narrow as may be, and allow for the bolt slot and strength besides.

Fig. 3, A, shows one of the patterns that most moulder men do not particularly love. It is not so difficult, but there are eight or more cut-

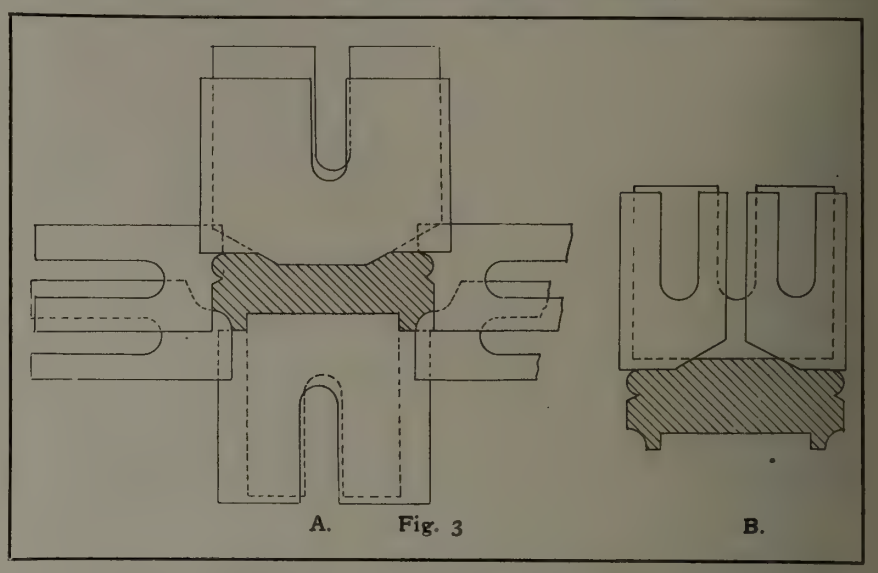

Fig. 3

ters to a small moulding, and then it must be made so as to fit together with its mate, both together being a pair of astragals for sliding door. Fig. 3, A, shows the arrangement and also suggests the system of balancing, but this latter requirement any good operator can manage in various ways. Perhaps I may tell about a few of them soon.

Fig. 3, B, shows the cut of the face side of the male member of the pair of astragals, and it is designed that the one straight knife shall balance the two bevel cutters. The balance of the setting would be like fig. 3, A.

The shaded part of fig. 4 is the cross-section of greenhouse rafter.

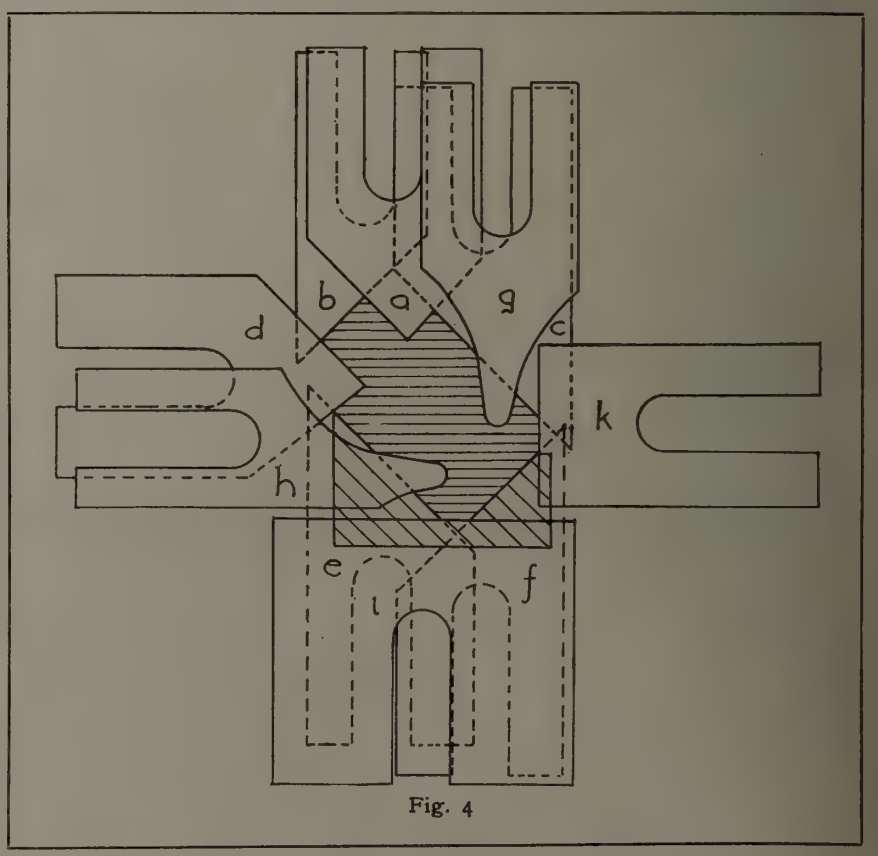

Fig. 4

and is one of the set-ups which the moulder man would gladly sidestep if it were possible

The runs on this kind of work are usually of considerable length, and it will pay any large shop to fit up a set of knives to do this detail.

Referring to the drawing, it will be necessary for the reader to pay close attention to the way the different knife outlines are shown, as it

is somewhat confusing to endeavor to show nine cutters at work all in one figure.

It will be noticed that the moulding is tipped down to an angle of 45 degrees, and in order to hold it and feed it through the machine in this position a shallow trough is made use of, as shown by the lightly shaded part under the moulding. This should be made of smooth, hard wood, extending the full length of the machine, and the side and bottom heads set up to it after it is in, so that the cutters will cut away the sides and bottom of the trough at their respective positions in order to make the necessary cut in the moulding and at the same time have the trough strong enough to serve its purpose.

One of the difficulties in running this pattern is the tendency of the stock to halt in the trough on account of excessive friction, but this can usually be overcome by using hard oil or axle grease in the trough and a spur feed in the upper corner, where the glass rabbet comes in the rafter, as shown at a.

In making this setting the operator must not forget to make allowance for the thickness of the trough when making his knife projections for the bottom and outside cuts. The top and inside are the same as usual. The faces that are usually cut with straight knives are worked in this case with bevel cutters, as shown at a, b and c on the top head, d on the outside, and e and f on the bottom head.

The two gutters are cut by g on the top head and h on the outside head. The straight knives i and k cut the bevels on the lower corners of the rafters. Some factories leave the bottom of the rafters square, and in such cases the use of the bottom head might be dispensed with entirely, provided the inside head will swing a cutter long enough to make the same cut from the side as the knife f does from the bottom.

It will be noticed that the arrangement of the knives as shown in the figure are as they would appear when the operator is looking at the set-up from the front of the machine.

Perhaps another word in regard to the trough may not be amiss, for some men might not foresee that the moulding will not fit the same channel that accommodates the blank stock, and that after the stock passed each cutter it will be about ⅛-inch smaller on that side. This may be provided for before the set-up is made or it may be delayed until the knives have cut through the trough, as already suggested. Some ⅛-inch thick strips of hardwood tacked onto the inner face of the trough will do the business and enable the pressure bar to hold the stock gently yet firmly until it drops clear of the machine.

If a moulder man makes his first set-up on this moulding in half a day's time, he will do well, but once having got his knives in the proper place he should never take them off before making a template or card for each head, showing the exact position of each cutter, so that he should be able to make the second setting in half an hour instead of half a day. Do not depend upon a sample piece to slip into the machine and set the knives to, for it is an abominable practice to attempt upon the planer patters.

It sometimes happens that these rafters have to be made out of lumber already dressed two sides to thickness, and in that case the cutters c and e may be dispensed with. Also the thin strip should be put in the whole length of the bottom, so as to bring the finished line to the same place as in the case of rough stock. The necessity of this occurs on account of using the templates of cards with the record of the previous settings, for if the set-up was made the same as for rough stock, each member would be approximately an eighth of an inch too high up on the moulding, and it is just as easy to put on the extra slip as it is to take the one off that is already on the back end of the trough.

End rafters which have the rabbet and gutter on but one side may be run in the same trough by throwing off the outside head and the straight knife from the bottom head. As the end rafters are usually made of thicker lumber, it will be necessary to move the trough out from the inside of the machine and lower the bed until the gutter and rabbet knives cut at the proper places and depth.

Some Reasons for Band Saws Breaking or Doing Bad Work

I give the following as some of the chief reasons, which may apply to either power or hand feed machines; but practical readers will doubtless be readily able to add to the number, says a correspondent of the "Timber Trades Journal":

1. Excessive vibration arising from poorly designed or constructed machines or faulty foundations.
2. Bad saws.
3. Saws of too thick a gauge for the diameter of the wheels.
4. Want of sufficiently elastic straining tension in mounting the saw wheels.
5. Too great, too little, or sudden straining tension, or the surface of the wheels worn or out of order.
6. In overcoming the inertia of starting the top or non-driven saw wheel, or from the top wheel over-running the bottom wheel and saw.
7. From the expansion of working and the omission to slacken the saw blade as it contracts after finishing work.
8. From lumps on the saw or wheels, or from imperfect brazing and the joint being thicker than the other part of the blade.
9. From chips dropping between the blade and the bottom saw wheel, or from an accumulation of dirt or gum.
10. Insufficient or improper adjustment of the guides for the saw as it enters or leaves the cut.
1. Improperly shaped teeth or wrong width of blade for the wood or work to be done.
12. Improper gauge or uneven sharpening and setting. Insufficient set will cause the blade to heat, run wavy, and set up cracks. Cracks will also be caused by too much set.
13. Insufficient gullet space allowing the sawdust to chamber and bind the blade. Rounded gullets are less liable to crack than angular ones.
14. Saw teeth burnt in sharpening by forcing the emery wheels.
15. Insufficient or too much strain on the blade by the counterweight.
16. Irregular roller or hammer tension in the body of the blade, leaving tight or slack spots.
17. Too much tension in saw teeth, or too long a back. Hammer tension applied too heavily.
18. Saw blades or guides out of line with travelling carriage or feed rollers.
19. Irregular wear on the lower saw-wheel bearings from the pull of the belt or slack top bearings.
20. The use of the cross line throwing the blade in a twist and causing it to rub harder against one guide than the other, and thus crystallizing the steel.
21. Allowing the blade to get convex on the tooth edge.
22. Forcing the feed, using dull saws, too much "hook," too slim teeth, etc.
23. Improper speed.
24. An inefficient operator.

In conclusion, given in the first instance a well-constructed machine, with an operator capable of running it on what may be termed scientific lines, with a good saw blade run at the proper speed and correct for the wood and feed in shape of teeth, sharpening, tensioning, setting, gauge, width, and temper, there is little doubt that a band saw is one of the most money-earning and valuable of all woodworking machines.

Positive Gauge for Moulder Bed

In a recent number a correspondent said the material he is putting through the moulder does not wish to follow the fence at back of machine. I also had quite a fight with this same trouble, says Geo. Hawley, in the "Wood-Worker," and the remedy is this: First see that the feed rolls are swung so they lead the stock just a trifle toward the back of the machine. The rolls of every machine should be adjustable

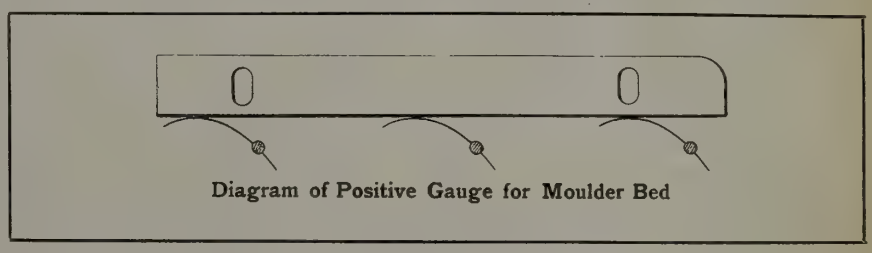

Diagram of Positive Gauge for Moulder Bed

in this respect. Then see that the pressure shoe just back of the top head is square and in line with the bed clear across, and not worn off on the side next the fence. Then, instead of using only the regular springs provided for holding up the stock, make a piece of hardwood about 3-inch wide, ½-inch thick, and the length from the chip breaker of the side head to the back of the machine, like sketch herewith, with a couple of slots cut crosswise. Drill and tap a couple of holes in bed of machine to take a couple of ½-inch cap screws, with washers under the head, which will go down through slots to guide, but must not be tight, as guide must be free to work backward and forward on these bolts. Now put the pressure springs of machine tightly up against this guide. This will give an equal pressure on stock the entire distance through machine. Another set of holes may be also bored in the bed, to allow of changing the guide for wide or narrow stock.

Mr. E. J. Darby, Crown timber agent, Ottawa, in a letter to the "Canada Lumberman" on the question of log rules, says in part: "The logs are getting smaller in average diameter year by year and in this agency 14 inches is the maximum average. Taking, therefore, a log 13 feet long and 14 inches in diameter as an illustration, there would be a difference of 12 feet b.m. between the Doyle and Scribner rule. Doyle rule gives 81 feet b.m. and Scribner 93 feet. The Doyle rule on logs over 23 inches diameter gives a less measurement than the Scribner, but in these times logs of that diameter are in the minority. The Quebec rule is from diagram, and cannot be worked out by rule, whereas the Doyle rule can be worked out by figures."

CAMP DEPARTMENT

Camps Should Insist on Goods in Wooden Packages

Low grades of lumber are always so difficult to sell that it is a wonder the manufacturers do not systematically assist in the production of a market by insisting upon having their goods shipped in wooden boxes instead, as frequently is the case, in fibre boxes. Probably the reason is that the manufacturers who conduct camp supply stores have not yet awakened to a complete appreciation of the influence they may exercise in this manner. A large cereal manufacturing company in the United States recently gave instruction to its salesmen to offer its goods in wooden or fibre containers to suit the customers' wishes. This is an indication that the work which has already been done in the way of fighting the fibre box has had good results. It shows also that by persistently following up a campaign of this nature the demand for box lumber can be considerably increased. This attitude is a perfectly reasonable one for lumbermen to assume. If the manufacturer fails to find a good market for his lower grades he comes in for a lot of criticism on the score of wasteful manufacturing. But what else can he do? Unless he gets a good market for the lower grades he must increase the price on the uppers and sacrifice the lowers. The amount of merchandise bought yearly for camp supplies is enormous. It is of practically every variety and a large share of it could be shipped in wooden cases. If operators would instruct their supply buyers to insist upon wooden packages there would be an immediate benefit secured.

Organizing a Lumber Camp Y.M.C.A.

Editor "Canada Lumberman":

It has occurred to me that anyone reading the article in your last number entitled "Camp Labor Troubles," might very naturally ask the question, "How do you propose to set about the organization of a Shantymen's Christian Association in the lumber camps?" and therefore a brief outline of our plan might be appreciated.

First of all then, the whole field must be divided into suitable districts. For example, take the Parry Sound district. In this district there will be some twenty or more camps. We purpose as soon as funds are available to place a light wagon, in charge of two suitable men, whose business will be to visit and hold religious service in each camp once a month. These men will be preferably such as have acquired a knowledge of men and conditions by actual manual labor themselves, either in the camps or among similar men, so that they can have sympathy with them, and speak to them out of their own experience. The services they conduct will be of the simple, old-fashioned type that always have appealed to men of all generations. As soon as they find the interest of the men themselves aroused in their own improvement, and have the consent of the proprietors to do so, they will find out whether the men will become members of the Association and pay a membership fee of, say, one dollar each to subscribe for reading material to be used in a reading room.

Three years ago, after holding a service in one of Burton's camps north of Magnetawan, the writer distributed leaflets giving a brief outline of the plan of forming an association, and asked the men to read them. The next day he went to where they were "dinnering out" and spoke somewhat as follows: "In regard to the Association, you will see that for a commencement it is nothing more than a reading club. You can pay $1 each to one of your own number, who will be elected secretary. He will get a list of magazines from some agent and you can have a meeting and decide just how your money shall be spent. Then, if you have a reading room you can make suitable rules regarding it, and appoint different members each night whose duty it will be to see a fire is started in good time and lights lit. Now, provided I can get Burton to put up the room, how many will chip in $1 a piece to provide reading matter, etc." Out of a camp of 30 men, 29 expressed their willingness to do this The writer went to Barrie to see the Burtons, and got a promise that the matter would receive consideration, but before anything was done the financial troubles of three years ago gave sufficient other matters for consideration to crowd this out.

Once a reading room is established under the auspices of the Association it has to be understood that it is at the disposal of either priest or approved Protestant missionary to hold a service in, and when any man in camp will do so a Bible class will be held in it on Sundays.

Two years ago, when we outlined our plans to such gentlemen as Mr. John McClelland, lately of the Parry Sound Lumber Copmany, we had no difficulty in getting the names of a number of prominent men to use as a General Council. but recognizing the uncertain condition of the lumber market then, we satisfied ourselves with merely attending so far as we could to the religious aspect of our work.

We feel, now that confidence is restored, that the time is ripe to make a real effort to organize our Association as above outlined, and we are convinced that it would be the very best business investment proprietors of camps could make, to take hold of this movement in earnest, and give us needed funds to develop it, not in one district alone, but in several. The writer has suitable men in view to man three or four outfits if he only had money to purchase them and to pay a modest allowance to the workers. In its infancy this work only appeals to the very best men, as it means hardship, but such men can be found.

During the past few weeks the writer has had opportunities of presenting this work to the attention of many in various churches, and one practical result has been the formation of a local committee in Hamilton. with F. W. Brennen as chairman, and another in London, while at the time of writing negotiations are in progress for other committees in Woodstock and Brantford. These people are preparing to do what they can to support the work because of its religious aspect. The proprietors of camps are merely asked to consider it as a business proposition.

A contented set of men throughout a season would mean the saving in railway fares, etc., of some thousands of dollars to large operators. A good moral sentiment in a camp would mean another great saving, while an advance in the intellectual standard would mean greater economy everywhere

If any of the readers of this article are in sympathy with the writer's views, or have objections to raise to them, he would be glad to hear from them.—William Henderson, Burk's Falls, Ont.

Perhaps one of the things that attract French-Canadians to British Columbia lumber camps is that the prunes are fresher there, not having so far to come from California. Once a French-Canadian lumber jack was hired by the foreman of a lumber camp. "Is de chuck good?" he asked the boss, when the matter of wages had been settled. "Oh, yes," answered the foreman. Later Bachees went in to dinner, and saw no prunes on the tables. With a shanty oath he turned to the foreman: "Sacrement! You call dat de good chuck, no prune on de tab'?"

Progress in Lumber Camp Comforts

Life and conditions in Maine lumber camps have been greatly revolutionized in the last decade as a result of the steady march of progress, and it is doubtful if one of the old time woodsmen would recognize the lumber camp of to-day as the lumber camp of the past, says a Maine exchange. Most everything has been changed around, and the lumber jack of the present day lives almost in luxury compared with his compatriot of ten or a dozen years ago.

To begin with, the axe of the woodsman has seen its best day. Formerly the spruce and the pine were felled to the ground by the use of the axe, but now the cross-cut saw has taken its place, and thereby greatly simplified operations. Where it took minutes to bring a tree to the ground it now requires only seconds, and at the same time it is possible to save much valuable lumber by being able to cut closer to the ground with the saw.

What would the old time lumber jack say if he should see one of the water wagons used on the roads now to make the sledding easier? In the old days, when it was necessary to make hauling better, the roads were iced by hand or other laborious means were used to accomplish the purpose. Now lumbermen provide their crews with a water wagon if they have long, hard hauls, and by using one of these contrivances just before night the road is sure to be in apple pie condition the next day, with cold weather.

The telephone has at last reached the lumber camp, but it has been a long time getting there. Practically all operators now maintain telephone lines where it is possible, and thereby save quite a bill of expense. The Great Northern Paper Company has its camps all connected by 'phone and finds that it is a great labor saver and convenience. Independent operators, who maintain two or more camps, usually have a line connecting them, and they find that they cannot get along without it. A telephone in a lumber camp saves probably more steps in the course of a day than a similar outfit would in the city in a week.

Getting down to the easy side of life, who would have supposed ten years ago that spring beds would be fashionable for the clerk and foreman of the crew? However, such an innovation is quite generally found in the woods at the present time, and the clerk or foreman doesn't have to think of getting fresh boughs for his bunk every so often.

The crew in a present day camp are fed much better than the one of ten or a dozen years ago. Fresh beef, pies and other table luxuries were little known in the average camp of years ago, but now the lumber jack who finds them missing from his daily fare is liable to give up his job or else do some "knocking" on the side to ease his feelings. Baked beans and pork still form the piece de resistance of the lumber camp menu, but the woodsman who has outgrown his appetite for them has enough variety on the table to satisfy his appetite.

For the Camp

When purchasing your supplies of provisions remember that we make a specialty of this business and just at the present time can offer some lines at exceptionally interesting prices. If needing any dried fruits let us hear from yon.

Valencia Raisins
Evaporated Peaches
Currants
Figs
Prunes
Evaporated Apples

We have some choice Grocery Barbadoes Sugar that costs much less than the regular yellow.

H. P. Eckardt & Co., Wholesale Grocers

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

WANTED—LUMBER, ETC.

Wanted

THREE HUNDRED THOUSAND FEET 1½ and 2" log run hard maple dry or new. State best cash price on cars. Box 102 CANADA LUMBERMAN, Toronto, Ont. 15

White Pine and Hemlock Lath

WE WISH TO BUY THE ABOVE IN CAR lots. Address, THE McDONALD LUMBER CO., Pittsburg, Pa. 15

Elm Wanted

WANTED—LARGE QUANTITY PARTLY green to green elm lumber, cut 1½ or plump inch. For further particulars apply to THE ORILLIA COOPERAGE CO , BOX 113 Orilla, Ont. 12

Wanted at Once

ABOUT 100,000 FEET 2-INCH BIRCH OR maple lumber, must be dry; to measure 12 feet long and from 7 to 12 inches wide. The ALASKA FEATHER & DOWN COMPANY, Limited, 400-432 St. Ambroise Street, Montreal. 14

Wanted Red or White Oak

FOR PRESENT OR FUTURE DELIVERY in the following sizes: 1", 1¼", 2", 3" and 4" 5x7, 5x8 and 6x9" Squares with hearts boxed. Apply Box 986 CANADA LUMBERMAN, Toronto, Ont. t.f

Birch, Basswood, Oak and Ash

WE DESIRE TO PURCHASE AT ONCE good Birch, Basswood, Oak and Ash lumber, all sizes. Write us and tell us what you have. BARTRAM BROS, Limited, Citizens Building, Ottawa, Ont. 14

Wanted Soft Elm, Birch and Spruce

Soft Elm, Good 1½ x 6" and up
Birch, 4 x 4, 5 x 5, 6 x 6, 1¼" 1½" 2" 3" and 4"
Spruce, Clear 2 x 4" and up

Box 982 CANADA LUMBERMAN, Toronto, Ont. tf

Wanted White Pine Pump Squares

Must be Quarter Cut

7"x7", 6"x6" AND 5"x5". HIGHEST MARKET prices paid, also 2" and 3" Tank Lumber. ONTARIO WIND ENGINE AND PUMP CO., Toronto tf

Cargoes of Hardwoods Wanted

WE ARE OPEN TO PURCHASE CARGOES o Elm, Maple, Birch, Basswood, etc, straight or mixed, cut to order to be brought to dock here. McDONALD-ROWLAND LUMBER CO., Owen Sound. 12

Elm, Birch, Basswood Wanted

5 cars 1 inch Common and Better Soft Elm
5 " 1 " " " Birch
2 " 1¼ " " " "
1 " 1½ " " " Basswood
2 " 1 " Cull Elm

Must be dry for immediate shipment. WILSON LUMBER CO. LIMITED, Toronto. 12

Wanted

Birch, Basswood, Ash, Em and Maple

WE REQUIRE THREE MILLION FEET 1" to 4", shipment when dry, can use LOG RUN DEAD CULLS OUT. Inspection at mill. Box 919, CANADA LUMBERMAN, Toronto. tf

Wanted Hard Maple and Soft Elm

WANTED FOR IMMEDIATE SHIPMENT, two cars 2" and 3" Hard Maple Plank, also for shipment any time during 1910, up to fifty cars Soft Elm, 1" x 12" and up wide x 6½' 7' 8' 13' 14' and 16' long. Address ROBERT BURY & CO., Lock Box 408, Teeswater, Ontario. tf

Wanted—Spruce and Pine

WE DESIRE TO CONTRACT WITH A FEW mills for their whole output in Spruce and White Pine. BARTRAM BROS. Limited, Citizens Building, Ottawa, Ont 14

FOR SALE—LUMBER, ETC.

Pine Piling

CAN SUPPY LARGE QUANTITIES PINE Piling any length up to say 70 ft., on cars C.N.O. R. Apply to A. PRENTICE, 649 Bathurst St., Phone, Col. 5729 or A. McPHERSON & Co., Longford Mills. tf

Hemlock Logs

FOR SALE FROM SIX TO EIGHT THOUS- and Hemlock logs, will saw to specifications. For further particulars apply to Box 195, Jordan Ont. t.f.

For Sale

NAIL KEG STAVES AND HEADING ALSO barrel heading in the square or circled, Box 990 CANADA LUMBERMAN, Toronto, Ont. 16

For Sale Cedar Shingles and W. P. Mill Culls

1,000,000 18" Good C. B. Cedar Shingles
500,000 1 x 7" and up 12/16' Mill Culls
500,000 1 x 12" and up 12/16' Mill Culls

Box 983, CANADA LUMBENMAN, Toronto, Ont. tf

Hemlock For Sale

FOR HEMLOCK BILL STUFF UP TO 30 FT. try ARTHUR SHERK, Whitehall, Ont. 12

Square Oak Timbers For Sale

FOR SALE HARDWOOD LUMBER OF ALL kinds. Wanted orders for Square Oak timbers 8 to 25'; and all sizes of Long Leaf Pine. Address Box No. 275, Fort Wayne, Ind. 13

For Sale

RED PINE PILES CUT TO ORDER AND loaded on Cars at once. Lenghts 20 to 60 feet, Diame'er: any size. Apply to PAPINEAUVILLE LUMBER CO., Limited, Papineauville, P. Q. 12

Wanted Lumber, Lath, Shingles Etc

WANTED—FIVE MILLION FEET OF DRY Pine, Spruce and Hemlock Lumber, also Lath, Shingles and Posts. Address Box 964 CANADA LUMBERMAN, Toronto. 12

FOR SALE

2500 CEDAR AND TAMARACK POLES suitable for Piles and Telegraph Poles, 25 to 50 ft. long, and 6 inches and up at top end. THE MUSKOKA WOOD MFG. COY., Huntsville, Ont tf

For Sale

3 cars 1" Cottonwood Box boards 13 to 17"
4 cars 1" Commonwood, 1's and 2's
10 cars ⅝" Crating Spruce
5 cars 1" Qt. Red Oak, 1's and 2's
3 cars 1" Qt. White Oak, 1's and 2's
35 cars 1" Plain Oak, No. 1, Common

For Sale—Timber Limit

BERTH 3, TOWNSHIP OF GUARD, PARRY Sound District, containing hemlock, birch (black) maple, red oak, basswood, spruce, and cedar. Apply Box 1456, Cuelph. 14

Automobile For Sale

OR WOULD TRADE FOR LUMBER OR timber land, 4 cylinder Darraqu, 50 h. p. Used only a short time and in excellent condition with all equipment including leather top. gas tank and exta tires. Co t $5,000.00, will sell for $2,500.00. Box 994 CANADA LUMBEMAN, Toronto, Ont. 12

For Sale

TIMBER LANDS, EIGHT HUNDRED ACRES, five of this is heavily timbered with mixed bush. Hemlock. Birch, Spruce, Pine, etc. Situated nine miles from Martin's Siding; Black Creek Dump, one and a half; Huntsville, fifteen. This is a fortune for a small mill man. Good clearing frame house and barn. For other particulars apply to owner, D. COMPTON, Aspdin, P. O., Ont. 12

A Pulpwood Klondyke

THE PICK OF THE FINEST VIRGIN timber lands in Labrador and Newfoundland. Advantages on Labrador over other territories: no cutting tax, no royalty, no export duty, pulp making and lumbering free of restriction, limitless water powers. We control valuale timber properties on Labrador and Newfoundland, and are prepared to give prospective purchasers all information regarding same. For further particulars apply to JOB BROTHERS & Co., LIMITED, St. John's, N. F. 23

Timber Limits For Sale

NINE SQUARE MILES ON CHERRY Creek and North Fork of Spallumcheen river Osogoos division, Yale district, British Columbia, about 50 miles East of Vernon and 20 miles west of Upper Arrow Lake.

These limits are comprised of bottom lands and benches of hills and contain about 100 million feet of the finest of Cedar, with a fair proportion of Hemlock, White Pine and Fir and are very conveniently situated for logging, with easy slopes toward streams. This is one of the most desirable properties in the Yale district and is steadily increasing in value. For further information address, BEATY TIMBER COMPANY, 4 Wellington St., East, Toronto. 14

Ratio of Rough Lumber

The United States Department of Agriculture in connection with a study of the wood using industries of various States, is learning what part of the rough lumber output of American sawmills passes through a second process of manufacture before it is ready for the consumer. The study is regarded as having an important bearing on the extent to which more economical use of our forest resources can be brought about. So far, the results obtained show that more than five-eighths of the rough lumber sawed is to be counted as the raw material for other industries which convert it into a more highly finished and more valuable product.

In the United States, waste in the woods, the mill, and the factory is so great that two-thirds of what was in the tree is lost on the way to the consumer. The heaviest part of this loss takes place in the sawmills. Much of this mill waste is unavoidable under present conditions, but the greater the demand for the product and the higher its value, the better will economy pay. Waste in manufacfacture is very small compared with that at the sawmill. Study of the demands of the wood using industries may be a means of finding out how the mill may profitably market a part of what now goes to the burner in sawdust, slabs, and trimmings.

Statistics of the wood using industries of Massachusetts, Maryland, North Carolina and Wisconsin, lately gathered by the Department of Agriculture in co-operation with these States, show that of their total sawmill output 36 per cent. is used in the form of rough lumber and 64 per cent. is manufactured into other forms of output. If the same ratio holds for the entire country as for these States, about 13,000,000,000 feet of lumber is used yearly in rough form and 23,500,000,000 feet is further manufactured.

This is the first time that detailed figures have been obtained on this subject. The study which has yielded these figures has also in view to ascertain what commodities are made wholly or partly of wood, the various kinds of wood used, their origin, and their cost, as well as other data of value to the growers of timber and to the sellers and buyers of lumber.

In making up the figures, lumber used as bridge timbers, house frames, farm fences, trestles, board walks, walls and similar classes of structures, with only such cutting and fitting as is given it by carpenters, was classed as rough lumber; that made into flooring, finish, siding, sash, doors frames, panels, stairs, boats, vehicles, boxes, baskets, turnery, woodenware, cooperage, musical instruments, farm implements, furniture, spools, handles, and like forms, was placed in the class of finished lumber.

"Salting" Oak Lumber

The practice of "salting" mines for the purpose of deceiving the prospective "tenderfoot" buyers has so long been used by the hardened miner and prospector as to have become common knowledge, though it is still a favorite practice among a certain class.

This same principle, however, has come to be used in an entirely different connection, and by a different class of men; namely, such lumbermen as are not above deception in order to further the sale of stock which otherwise could not be marketed. Thick oak and some other woods, when piled with strips for some length of time, are liable to shrink with extreme rapidity, in which case deep cracks invariably form along the medullary rays. As a result, dirt and dust and foreign matter of all kinds will introduce themselves, and fungus growth will be started, to the great detriment of the stock. The lumberman soon finds that in place of a quantity of high grade material he has on his hands a badly damaged pile of lumber

Instead of disposing of such material as rejects, if he is wise to the ways of some men he proceeds to take down the pile, and, after sprinkling a liberal coating of salt over the surface of all the boards, he dead-piles the stock. The deliquescent properties of salt are well known, and it is due to this fact that sufficient moisture is drawn to the surface of the boards to cause them to swell sufficiently to close the cracks on the outside and thus gives the lumber a solid appearance. In addition, the salt acts as a preservative, in that it prevents dry-rot, and thus makes it possible to leave the stock piled solid for a considerable period.

Even an expert and experienced lumber dealer might easily be deceived if he made but a superficial examination of the pile, as the only way to detect deception of this sort is to saw a number of the pieces in two in the middle and plane the exposed surface. Ordinary hand sawing would usually not suffice, as a rough surface left would not indicate the condition.

There is one case on record where a lot of 15,000 feet of three-inch oak, which had been purchased for high-grade material, was sawed, and actually yielded but 1,000 feet sufficiently sound to be used for the purpose for which it was intended. The remainder was not only full of cracks and checks, but was absolutely worthless.

Waste Products in Papermaking

It is common knowledge that the wood used for papermaking contains a large quantity of oleo-resin, sometimes as high as from 25 per cent. to 30 per cent., suitable for the manufacture of soap, paint, varnish, etc. The separation of this valuable residuum from the pulp has not hitherto been found possible without great waste and expense, but a process has been recently patented by which practically the whole of these products can be saved. The manufacture of paper from wood pulp is now an industry of such huge dimensions that the new process has obviously a great future, to the benefit, it is to be hoped, of producer and consumer alike.

The tendency of the times is to take more woodworking machinery into the woods, and more skilled workers to handle it, to have lots of side industries to saw milling to help utilize our timber resources better. These special side lines are excellent things for the skilled woodworker to post himself on, as many of them are conducted on a profit-sharing basis and form opportunities for the competent man to grow into a business man as well as a skilled worker.

Review of Current Trade Conditions

Ontario

The advance in prices of hemlock which were made a fortnight ago are being maintained fairly well. Manufacturers are short of dry stock and as there is a good demand it is expected that the better prices will continue. With the exception of hemlock there is no feature to the market. Trade throughout the province is still rather quiet, as a result largely of the retailers being well stocked. Across the boundary line, there is a fair trade only, dealers being affected by the unsettled financial and political conditions. In southwestern Ontario trade is better than elsewhere throughout the province. Reports from that district are that trade was never better and prices are ruling firm.

Low water on the upper Ottawa and its tributary streams is causing considerable anxiety regarding the getting out of the logs. Fortunately, most of the larger companies always have a year's supply of logs ahead and therefore will not be inconvenienced. The export of lumber by barges to New York State has commenced, but there is considerable uncertainty as to what class of lumber the barges will carry. Stocks of well-seasoned pine and lath are very plentiful. There is also a large supply of spruce, much of which, however, has been sold for water delivery. Trade at Ottawa has been very quiet, although the better grades have been moving off steadily. There is still a very heavy stock of low grades and sales are made from $1 to $2 a thousand less than a year ago. Mill culls and box lumber are lower than they have been for some time. Dead culls are being bought by wholesalers at from $10 to $13 f.o.b. Ottawa. Local building activity is extensive. The building boom in Montreal has also improved the demand for 3-inch mull culls. Mill culls 3 x 7 and up, 6 to 16 feet, are being quoted at $15 to $16. 3 x 11 of the same length are quoted at $16.50 to $19, and 3 x 11, 14 to 16 feet, at $18 to $20. Lath are unsettled, although inquiries are numerous and are helping to keep up quotations. No. 1 white pine is selling at $3.75 as a minimum, and No. 2 at $2.75. The higher class of shingles are a shade easier, stocks being large.

Eastern Canada

There has been anencouraging improvement in the condition of the drives in New Brunswick during the past fortnight. Heavy rainfalls have changed matters materially and although the expense of securing logs has been much greater than usual, the danger of a shortage has been greatly reduced. The St. John river drives did not benefit as much by the rains as those in other parts of the province. The first section of the corporation drives, consisting of 25,000,000 feet, reached Fredericton on May 31st, but there occurred an extensive jam at Black river rapids which held up from 12 to 15 millions of logs. The trade in spruce lath is improving. They are selling at from $2.55 to $2.65 per thousand on the wharf on the Miramichi and at St. John the price is from $2.65 to $2.75. Supplies at both these points are moderate, amounting to about 3½ millions at St. John and from 1½ to 2 millions at Chatham and its vicinity. There is a fairly good demand for merchantable spruce boards at Miramichi points, the price varying from $16 to $16.50. Stocks are still rather light as the mills have only been sawing for a few weeks.

Reports from Boston indicate that the spruce market has become much quieter. Buyers are not increasing their stocks. A reduction of 50 cents is frequently offered but it has not resulted in any noticeable increase of business. Some of the dealers, however, will not offer this reduction and as a result trade has been checked. Lower prices are looked for by many of the dealers. The price most generally asked at present for frames 9-inch and under is $23.50. There has not been much demand for random. Small sizes vary from $20 to $20.50 but business at the higher figure is very scarce, while some business is being done at less than $20. Large random is rather firm. The demand for spruce boards is quiet. There is a good outlook for eastern spruce at New York but orders are rather small at present as dealers seem to prefer to take their chances on higher prices later on. The cargo business is much lighter than is usual at this time of year. Wholesalers are finding it difficult to obtain business at the prices which mills are requiring. The shingle market at Boston is still unsatisfactory as buyers will not pay the prices which are asked. Canadian manufacturers are wanting as much as $3.75 for cedar extras. Yet sales of good shingles have been made as low as $3.30. The general price asked ranges from $3.30 to $3.50, but there is very little business being done at any price. Lath have declined and the demand is still quiet. Manufacturers are asking $3.75 to $3.80 for 1⅝-inch and $3.50 to $3.55 for 1½-inch.

Great Britain

The fine weather throughout England has had a stimulating effect upon the lumber trade. The consumption of wood for building purposes has obtained encouraging dimensions and in some of the metropolitan suburbs house construction is quite brisk. Throughout the provinces also, the building trades are considerably improved. In London the lumber business along with others is assuming a settled appearance once more. Prices in general are maintained steadily and stocks are somewhat moderate. Arrivals also are fairly light, so that there is encouraging prospect of continued improvement. An interesting feature of the lumber trade in London during the past fortnight was the sudden and extensive demand for lumber for the erection of seats from which to view the funeral procession of King Edward. No less than 1,000 standards of timber were utilized in this manner. Foy, Morgan & Company held a one day's auction sale recently at which 3x11 third Montreal pine regulars sold for £16 10s. and £16 5s., with fourths at £11 15s. and £11 10s. 2-inch Montreal birch could not go beyond 1s. At the Surrey commercial docks there has recently been much more activity than for many months past. In addition to arrivals from Continental ports, there has been a fair quantity of Canadian wood goods by the usual liners.

At Liverpool the most satisfactory market of late has been that for spruce deals, which have been firm and in good demand. Consumption is continuing steadily and fresh arrivals are disposed of quickly from the quay. Spruce c.i.f. prices for cargoes continue firm and an advance is expected with the opening of the import season. There are practically no stocks of any lengths of a respectable average. Very few of the recent liner arrivals have averaged more than 13½-foot lengths, and it is expected that cargo specifications will sell at advanced prices. There is still a shortage of 2½ x 7-inch battens, with a good demand. 3 x 9-inch deals are also somewhat scarce. Other sizes are fairly plentiful. There are not too many sawn boards on the market and values show an inclination to advance. Extensive contracts for New Brunswick spruce deals of ordinary specification have recently been made on a basis of £8 5s. and upwards, c.i.f. to the Mersey for June loading. Holders of stock are felling correspondingly assured.

The Canadian season has opened with the first arrivals by direct liners from Montreal. One parcel went direct into consumption from the quay, but it is reported that deliveries are not occurring to the extent which importers desire. C.i.f. values for Quebec pine logs, waney-square, are very firm and higher than those of a year ago. It is expected that they will advance still further. First quality deals are reported to be rather dull but first quality sidings are in good demand and scarce. Second quality deals are also in fair demand and not any too plentiful. Second quality sidings are rather quiet. No improvement has occurred in the demand for lower qualities, although it is fairly steady for deals. Red pine has improved and values are slightly higher. The market for birch planks is unchanged. Fresh deals are in somewhat better demand and prices are firm. The stock of last year's planks is still fairly extensive and prices may decline somewhat as the stocks do not improve with keeping. Stocks of birch logs are disappearing rapidly, the demand having improved. Prices are fairly steady though inclined to be easier. At Manchester spruce deals are arriving in steadily increasing quantity, but as stocks were very light, values are not expected to show any decided alteration.

There is little new to report in the market conditions at Glasgow the movement of lumber being on rather restricted lines. Quebec shipments to hand so far have consisted principally of contract goods and have disappeared directly from the quays. A few sales of pine deals, birch logs and planks are reported at firm prices. Spruce is becoming quite scarce and some fancy prices are being quoted as a result. Hardwoods are moving steadily, though rather slowly, and are confined to stored stocks.

United States

Generally speaking, the lumber trade throughout the United States is more active to-day than it was at this time a year ago, though it is characteristic of the conditions now existing that they are not by any means uniform. In the north Atlantic States the demand for lumber is reported to be rather of a hesitating nature, which is characteristic of conditions at this time of year. The most important feature in connection with the demand for northern pine is the general call for high grade stock. Better grades are reported to be scarce and the lower grades, too plentiful. At New York there is only a light demand for white pine. The local stocks were low and the buying is of an intermittent character. There is a fair trade in white pine at Buffalo and the Tonawandas and high grade stock at those points is light. In fact, consumers are compelled to substitute other woods for white pine. Some of them make use of cypress and Pacific coast woods for this purpose. There is much activity in high grade stock at Toledo and also at Cleveland. At the Saginaw points there is a healthy trade and shipments are more extensive than they were a year ago.

There has been a remarkable increase in the lumber receipts and shipments at Chicago this season. The total receipts from January 1st to May 28th were 1,025,373,000 feet, an increase of 139,940.000 feet over the receipts of the corresponding period of last year. The total shipments from January 1st to May 28th were 424,798,000 feet, compared

Cleveland - Sarnia Saw Mills Co., Limited

We go after GOOD LOGS and manufacture them into GOOD LUMBER

You have got to carry a good line of lumber if you expect repeat orders. Come to us and you'll get the best.

Special bills cut to order, any length ten to sixty feet, White Pine, Norway or Fir.

Cleveland-Sarnia Saw Mills Co., Limited

SARNIA, ONTARIO

with 352,413,000 feet a year ago. Apparently the lumber business at Chicago for the present year has been a great deal more satisfactory than that of 1909.

Upper grades of northern pine are very firm at Chicago and are readily sold at full list prices. Stocks are low. The lower grades continue in poor demand. The demand for hardwood at Chicago is fairly active. Plain sawed oak is in the best demand and stocks of dried lumber are scarce. Quarter sawed white oak is also in fair demand in the upper grades. Quarter sawed red oak is moving well for 1sts and 2nds. Hickory is quiet but steady and a moderate demand is reported for white ash in good inch and thicker. Pacific coast woods are selling well at Chicago and prices are firm. Western pine is especially strong. Yellow pine is rather slow with prices anywhere from 50 to 75 cents lower than they were two months ago. Shingles and lath are about steady at Chicago. White cedars are unchanged at $2.90 for extras and $2.45 for standards. Red cedars are quiet. Clears are bringing $3.32 and stars $2.84.

The hardwood trade at Buffalo is quite satisfactory, though sales are rather light, as is usual at this time of year. Oak is in good demand and scarce. Birch and chestnut are also somewhat scarce. Cherry is in fair demand, while elm and basswood are rather dull. Stocks of maple are light. Walnut is quiet. The demand for shingles at Buffalo is good, and better prices are being anticipated. The supply, however, is extensive and quotations at present are unchanged. Washington red cedars are the most active. The price of white cedars is rather low.

Market Correspondence

Low Water Causing Delay in Ottawa Drives

Ottawa, June 11.—The low water situation has become so acute on Upper Ottawa streams that the log drive has been abandoned on several tributaries of the Ottawa. Logs are left on Blanche river, Bryson creek (which empties into the Quinze), Jocko and Schyan rivers. More than the usual number of logs will also be left on the Petawawa and Kippewa rivers. The Hawkesbury Lumber Company, Pembroke Lumber Company and A. & F. Fraser, of Pembroke, own a considerable quantity of the drive left behind, but the two former have enough material already in the Ottawa river from the previous season to ensure continued operations all summer. McLachlin Bros., as in former seasons, will not remove last winter's cut of logs from the Petawawa river. The company keeps a year's supply of logs ahead. The circumstance is fortunate this year on account of the low water. A. & F. Fraser, of Pembroke, are starting the manufacture of lumber this season. Any time they will lose waiting for logs will be devoted to cutting for other lumbermen.

The Upper Ottawa Improvement Company, which has charge of the drive, gives assurance that in no case will there be any interruption to sawing as a result of the delay in getting logs out of the upper tributaries. The drive is being expeditiously handled in the main stream, although in some places the dearth of water is felt. On June 20th a new tug, the "Hiram Robinson," will be employed in the vicinity of Sand Point with a greater capacity than the "John L. Murphy," which it replaces.

The first American barge of the season arrived last week laden with coal, and five more came this week similarly laden, all to go back with cargoes of lumber. Three of these barges are being loaded with spruce for points in the State of New York. The total number of American barges which will call for lumber at Ottawa river points in June is estimated at 50. This was the number last June. The start of the shipping season was then greatly delayed by abnormal floods which tied up navigation and kept the sawmills idle for a month. This year the American barges were kept back almost as much by delay in getting through the Champlain canal. All but the first half-dozen of barges will leave their cargoes inward at Montreal. There is no certainty as to the kind of lumber the American barges will take back. There is enough well seasoned pine and lath to furnish freight for another month. Spruce is also plentiful and much of it has been sold for delivery by water. The Ottawa Transportation Company is doing a steady, quiet business in lumber, delivering at Montreal and Lake Champlain points.

Quietness pervaded almost every branch of the lumber market in the last fortnight. The statement that good lumber could be sold very easily is the first response made to the inquirer by all the local manufacturers. Some have an optimistic view of the immediate future for lower grades, but the fact remains that a great deal of that stock is on hand. Sales are made from $1 to $2 per thousand less than a year ago. Mill culls and box lumber are passing through a duller period than the extreme low grade of all, dead culls, if one may judge from the condition in some yards. Local consumption of dead culls is increasing and the farming community buy them heavily. The price to wholesalers runs from $10 to $13 per thousand f.o.b. at Ottawa. There never was a brisker period in local building. Last month's construction permits amounted to $651,150, or $23,000 more than last May, which at the time was a record. The building boom in Montreal too, has improved the demand for 3-inch mill culls, used there for house and sidewalk construction. One large mill owner produces from five to six million feet of these per season, many of which are now being shipped by barge to Montreal. Quotations for mill culls, 3-inch x 7-inch and up, 6 to 16 feet long, are $15 to $16; 3 x 11-inch, same length, $16.50 to $19; 3 x 11-inch, 14 to 16 feet long, $18 to $20.

The lath market is very unsettled. It would be easy to buy a few millions of last year's stock from some of the dealers. There are many inquiries which keep quotations up, and manufacturers are not weakening. Local dealers have lost in the last couple of years by selling off lath when the market looked dull and they are not likely to make the same mistake again. The output of the Ottawa valley mills will be normal, or something better than in 1909, when floods stayed production during the month of May. No. 1 white pine has not sold lower than $3.85, and the minimum price for No. 2 is $2.75. A slight decline has been noted in the higher class of shingles. The stock is much larger than at this time last year.

Rainfalls Improve New Brunswick Log Driving

Chatham, N.B., June 9.—Driving conditions, as is usual at this time of year, are now the most interesting phase of the lumber industry to the manufacturer and also, in a less direct way, to the dealer. Until a week ago it looked as if there might be considerable hang-ups on the principal rivers of New Brunswick. During the past week there have been rainfalls of sufficient magnitude to considerably change the present conditions and the outlook. The driving season has been a most arduous one and the time occupied in getting the logs out has been much longer than usual. As well as being long and arduous, the season has been most expensive and the increase per thousand in the cost of logs will be a substantial one.

The rains of last week showed particularly good results on the Miramichi. The water rose two feet on the main river and many drives that were having a hard time came out with ease, while work on others which had been left was resumed, with the result that they will soon be in safe water. While there may be hang-ups at different points, the indications are that no one firm will have enough logs hung up to materially cripple their sawing operations during the coming summer.

On the St. John river conditions have also improved but the rain had no such favorable effect as was the case on the Miramichi. More rain is needed on the St. John to ensure the getting out of all the drives. There is a jam at Black river rapids consisting of twelve to fifteen millions of logs, owned by St. John and Fredericton concerns, which logs are still far from being in safe water. The first section of the corporation drive, consisting of 25,000,000 feet, reached the booms at Fredericton on May 31st.

On the Restigouche driving has also been materially aided by the rains, and while it is thought possible that there may be a million feet or slightly more hung up, there will be enough come out to keep the mills sawing.

The wages paid to stream drivers this spring ranged from $2.25 to $2.75 per day. In some cases, it is stated, exceptionally good men were paid as high as $3 per day.

The spruce lath trade is attracting a great deal of attention. This line seems to have a tendency in the direction of greater firmness. The local value of spruce lath in this section would be from $2.55 to $2.65 per thousand on wharf on the Miramichi. At St. John the price would range from $2.65 to $2.75. Supplies at both these principal points of shipment are properly described by the word moderate. At St. John the aggregate would be in the vicinity of 3,500,000, while available stocks in the vicinity of this town would range from one and one-half to two millions.

Freight sales from this port to New York range from 80c. to 90c. per thousand on lath and from St. John to New York the prevalent rates are 62½ cents and 65 cents.

Merchantable spruce boards are in fairly good demand and the local value runs from $16 to $16.50 per thousand superficial feet. Trans-Atlantic shipments have not been remarkably heavy, but as the spruce mills have been sawing for only a few weeks, stocks in this line are by no means heavy. Trade for spruce boards in the Magdalen Islands and in Prince Edward Island promises to show considerable life during the summer and the probabilities are that there will be a number of shipments to the markets of the United States by water.

The Riordon Paper Company, Limited, have not yet come to any definite conclusion about the pulp plant which they contemplate building at Merritton, Ont. At present they have the plans drawn up roughly, but they will not come to a definite decision about building until the plans have been worked out in detail.

Clendenning Bros., of Calgary, Alta., have purchased the mill and limits of Pugh & Livingstone at Dorr, B.C. They will plant an experimental farm of 300 acres on their property.

Lumbermen

Who are critical in their demands always find in our method of selling direct to the regular trade, the close attention to the minutest details so absolutely impossible to secure when buying haphazardly.

To provide for filling all our orders promptly and satisfactorily, we have large and well assorted stocks on hand constantly—a feature that can hardly help pleasing you.

We want to prove to you that we are different from the others in many ways.

A Trial Will Convince You

Montreal Retailers Trade Active

Season's Trade To-Date has been Good—Rains Depressing Export Business—Building Permits Increase

Montreal Office of the "Canada Lumberman."
Montreal, June 11, 1910.

The continual rains of the past fortnight have considerably retarded the movement of local lumber and complaints of the weather are heard on all sides. The work of the export men, which must proceed at all costs is made doubly arduous. In both wholesale and retail circles trade is reported extremely sluggish and this condition of affairs is charged wholly against the weather man.

Retail men generally, state that to date they have enjoyed a good season. The building in both the northern and eastern parts of the city has been quite extensive, with the lumber requirements greatly in advance of last season. The building permits given below show a splendid gain and it should be noted that these figures do not include several large structures which will be built this year, such as the Windsor station, Yorkshire building, Dominion Express building and Place Viger station, so that the present outlook may be considered quite satisfactory.

The building activity in Montreal shows encouraging increase. During the month of May and the first five months of the year, the figures were as follows:

1910	Permits	Value	1909	Permits	Value
New Buildings	329	$1,574,615	New Buildings	203	$1,107,790
Alterations	124	128,585	Alterations	124	161,714

Total increase of May, 1910, over May, 1909, $433,696.

January 1st to May 31st, 1910.	Permits	Value	January 1st to May 31st, 1909.	Permits	Value
New Buildings	1093	$4,171,509	New Buildings	659	$2,691,191
Alterations	390	450,117	Alterations	368	421,929

Increase 1910, $1,508,506, or 48.45 per cent.

Retail yards, in point of stocks carried, show a wide variation. There are many which are still quite heavily stocked and will not be buying to any extent for some time, while on the other hand there are those whose stocks are much lighter than usually carried at this season of the year. This latter condition being partially attributed to the recent unsettled condition, due to the tariff issue.

Market Conditions

All classes of lumber show little variation from recent quotations. The spruce market, particularly 1-inch dry, is a buoyant feature at the present time. Southern pine in sympathy with the American market, is held at stiff figures. Birch and basswood are quoted firmly. The New York market is reported to be giving signs of once again resuming a busy tone and enquiries are coming in freely for lath, basswood and hardwoods generally. The 13-foot spruce market is holding up well and dealers are looking for some good business in this line.

In the Boston market the demand for lumber is reported to be only fairly active, with buyers in some cases holding their orders for an anticipated drop in prices. Hemlock boards are a feature and are bought up as offered. Shingles have shown a tendency to weaken and prices are a shade lower, extras being quoted at from $3.30 to $3.50. Southern pine is moving quietly at firm prices, while the hardwood situation is practically unaltered.

Pulpwood Movements

The following barges and steamships with cargoes of pulpwood consigned to New York State ports have been registered at the local canal offices since the opening of navigation:

May 2—Barge Frank D. Ewen	cords	650
May 14—Steamer Georgetown	cords	745
May 14—Barge Ben Harrison	cords	501
May 19—Steamer Waccaman	cords	764
May 20—Steamer Querida	cords	1,065
May 21—Steamer Ionia	cords	185
May 26—Steamer Russel Sage	cords	550
May 31—Steamer Keyport	cords	960
June 2—Drowning Maud	cords	650
June 6—Steamer R. F. Holcomb	cords	275
June 6—Steamer Georgetown	cords	734
June 6—Barge Ben Harrison	cords	483

For the initial shipping month of the year the total of lumber exported from the port of Montreal during May makes a good showing. The shipments in standards (1 standard=1,980 feet) with a list of ports to which cargoes have been consigned, follows:

Liverpool, 2,183; Glasgow, 1,599; London, 469; London and Antwerp, 714; Leith, 214; Bristol, 264; Manchester, 505; Dublin, 162; Hull, 256; Belfast, 342; South Africa, 310, Avonmouth, Havre, Dundee, Hamburg, 215. Total, 7,233 standards, or 14,321,340 feet.

A large delegation of lumber merchants conferred with the Quebec Government on May 30th, and complained that the increase in stumpage dues provided for in the Government's new law would seriously injure the lumber industry, and would be especially prejudicial to the lumber merchants of the Gaspe coast. They asked that the old rate of 65 cents on cedar should remain and not be increased to $1.40, as provided in the law, claiming that shingles were being manufactured at a loss and that a great many mill owners were carrying over shingles that they had last year. An increase in the dues, they said, would simply mean the shutting down of the mills. In addition, they asked that the stumpage on fir be limited to forty cents. They claimed that the reductions in dues should be particularly applied to the Gaspe coast, where circumstances made lumbering unprofitable and rendered it difficult to compete with other lumbermen of the province. Special encouragement, they contended, should be given to those who erected pulp mills on the Gaspe coast. Companies willing to invest capital in the erection of mills should be given a 20-year guarantee from the Government, instead of ten years, under the present regulations, so that the owners might be given an opportunity to float their bonds, it being impossible to raise money for pulp and paper mills with a 10-year guarantee.

Personal and Trade Notes from Quebec Province

The marriage of Miss Winifred Hall Price, daughter of Mr. H. M. Price, of Quebec, to Mr. A. W. Jamieson, of the Royal Canadian Artillery, Halifax, was solemnized the first week in June. Mr. and Mrs. Jamieson are enjoying a honeymoon trip in England and Scotland.

Mr. Arthur H. Campbell, managing director of the Campbell-McLaurin Lumber Company, spent a few days in New York recently visiting the company's office at No. 1 Madison avenue, which is in charge of Mr. M. H. Gatchell. The New York situation, he reports, continues to show promise of improvement. The building permits are increasing at a healthy rate and generally the demand for lumber is better than was the case a year ago.

The Fletcher Pulp & Lumber Company, of Sherbrooke, have disposed of their cut of dry birch at Magog, to a Montreal wholesale firm.

The Dominion Textile Company are considerably enlarging their Magog plant and factory, and have placed an order for their lumber requirements with a Montreal lumber house.

Mr. J. C. Siemon, of Toronto, president of the Siemon Company, Limited, manufacturers of high grade hardwood floorings, was in Montreal for a few days recently.

Congratulations to Mr. Herbert J. F. Grier, son of the late Mr. B. Grier, who was married on June 1st to Miss Coles, of Montreal. Mr. and Mrs. Grier are at present on an extended wedding trip through the United States.

The marriage of Mr. Horace Hartley to Miss Lason, of Montreal, was celebrated on Wednesday, June 8th. Mr. Hartley is quite well known in local lumber circles and the "Canala Lumberman" joins in extending heartiest congratulations.

Mr. J. P. Dupuis, formerly secretary-treasurer for Messrs. Latour & Dupuis, wholesale lumber merchants, and manager for the Tobin Manufacturing Company, has opened a lumber office at 340 Church avenue, Verdun, with a general retail yard in connection.

About $5,000 damage was occasioned to the plant of the Nicolet Falls Pulp & Lumber Company, near Danville, Que., recently. By the energetic work of the employees the brick factory building was saved, but the boiler house and dry house with the boiler anl machinery, were completely destroyed. The property was insured.

The barges "Dakota" and "Iorula" have arrived from St. Augustine, Florida, loaded with pitch pine consigned to the Canada Car Company, Limited. This lumber will be utilized for the construction of the numerous orders for cars which the company have on hand at present. The "Yola," with a similar cargo, is on the way from the south.

The mill of the Beauce Pulp & Lumber Company, the property of Messrs. Gooday & Foy, of Quebec, situated at Scott's Junction, Beauce county, was completely destroyed by fire recently, together with a quantity of pulpwood. Messrs. Gooday & Foy estimate their loss at about $40,000, covered by insurance.

Campbell-McLaurin Coy's Annual Meeting

At the annual meeting of the Campbell-McLaurin Lumber Company, held at the head office, Montreal, on May 31st, Mr. Maurice Welsh was elected to the directorate in place of the late Thos. F. Strong, of Ogdensburg, N.Y. Mr. Welsh is not new to the company's interests, having been in charge of their Ontario business, with headquarters in Toronto, since the organization some years ago. The other officers were re-elected, as follows: President, Alex. McLaurin; Vice-president, Mr. J. D. McLaurin; Managing Director, Mr. Arthur H. Campbell. The directorate is composed of these officers and Messrs. Geo. F. Ryan and Maurice Welsh. Very favorable reports covering the past year were received. At the conclusion of the meeting in Montreal an inspection trip was made by the directors to the company's large planing mill and plant at Drummondville, Que.

THE E.R. BURNS SAW CO. LIMITED
CHISEL TOOTH
TRADE MARK
SAW.
TORONTO.

Extract from Letter received from Eastern Canada

GENTLEMEN :—

We received your No. 2½ Chisel Tooth Saw and have tested it very thoroughly and are pleased to write that it is the most perfect saw we have ever had. The tension is the finest. It is the only saw we have ever had to stand up and do good work with the heavy feed we carry.

We are sending you saws of another make and would ask you to hammer them the same as the one you sent us.

When we need new Saws, you get the order.

This was a Burns No. 2½ Chisel Tooth Saw giving satisfaction under very heavy feed

EDGINGS

Ontario

The Rathbun Company will not operate their mill at Bancroft, Ont., this summer. The logs are being shipped to Deseronto to be cut into lumber.

Mr. R. J. Manning, of Owen Sound, has opened negotiations with the industrial commissioner, with a view to the establishment of a wood pulp factory in Peterborough.

The Canadian Hardwood Company, Limited, Toronto, Ont., has been incorporated with capital of $490,000. The incorporators are Strachan Johnston and Reginald Holland, solicitors, Toronto, Ont.

It is reported that some 64.000 acres of timberlands at Klock, Ont., which two years ago cost $48,000, have been sold by the Algonquin Lumber Company to Rung Brothers, of Buffalo, N.Y., for $240,000.

The United Paper Mills, Limited, Toronto, Ont., capital $40,000, have secured incorporation. The incorporators are Morley P. Wilkins, accountant, and R. I. Finlay, merchant, both of Toronto, Ont.

The Toronto Kiln Dried Lumber Company, Limited, Toronto, Ont., capital $40,000, has secured incorporation. The incorporators are Robt. S. Wilson, merchant, and Wm. D. Wilson, manufacturer, both of Toronto, Ont.

The Canadian Consolidated Mining, Lumber Utilities Company, Limited, Toronto, Ont., capital $4,000,000, have secured incorporation. The incorporators are W. C. Coleman, accountant, and H. S. Pritchard, barrister-at-law, Toronto, Ont.

J. R. Eaton & Sons, Limited, Orillia, Ont., have secured incorporation with capital of $100,000, to carry on the business of lumber and timber merchants, builders and contractors. The incorporators are James R. Eaton and Edwin R. Eaton, manufacturers.

John Pirson, lumber manufacturer, is building a new mill at Stevensville, Ont., which, when complete, will have cost from $6,000 to $8,000. The machinery which is being installed includes planers, heading turner, jointer, packer, two heading saws, and stave and hoop machine.

Eastern Provinces

J. A. Roy & Fils, lumber dealers, Montreal, Que., are reported to have assigned.

Limoges & Freres, lumber dealers, Terrebonne, Que., are reported to have dissolved.

Dobell, Beckett & Company, wholesale lumber dealers, Quebec, Que., are reported to have dissolved.

Falstrault & Landreville, sash and door manufacturers, Longue Point, Que., are reported to have dissolved.

S. G. Paulin, of St. John's, Que., a practical mill man, is looking for a timber limit and a suitable site for a sawmill near Nelson, B.C. After spending a short time in Nelson he is now visiting the neighboring country.

The mill of the Beauce Pulp & Lumber Company, the property of Messrs. Gooday & Foy, of Quebec, and situated at Scott's Junction, Beauce county, was completely destroyed by fire recently. Messrs. Gooday & Foy estimate their loss at about $40,000, covered by insurance.

The Silliker Car Company, of Halifax, N.S., have been awarded a contract by the Grand Trunk Railway for 500 freight cars. The Silliker works have contracts in hand which include Pullman coaches for the I.C.R. and passenger and freight cars for the Canadian Northern Railway.

Fire did about $5,000 damage recently to the plant of the Nicolet Falls Pulp & Lumber Works, situated about two miles from Danville, Que. The brick factory building was saved, but the boiler house aand dry house with the boiler and machinery were completely destroyed. The property was insured.

The capital of the Wm. Rutherford & Sons Company, Limited, Montreal, which was recently reincorporated, is $150,000, not $60,000, as at first reported. Under their new incorporation the company have secured slightly extended powers. They are carrying on their business, however, in practically the same manner as heretofore.

The Eastern Canada Lumber & Construction Company, Limited, a New York corporation, has taken over the Prescott property in Albert County, N.B. The property includes 20,000 acres of valuable timber lands, a large sawmill, stores, dwellings, five employees' tenement houses, barns and a general store doing business of more than $50,000 a year. The corporation has also purchased 3½ miles of branch railway connecting the sawmill with Harvey wharf. There is 40 feet of water at this wharf at high tide, and the new owners plan to load their product into vessels for direct shipment to local and foreign markets. The price paid was more than $100,000, and extensive improvements and the installation of a larger plant will bring the expenditure up to $200,000. Negotiations have been in progress for some time. The final papers were signed on May 31. Officers of the company are: W. H. Malcolm, president; James H. Moran, vice-president; Archibald Tippett, treasurer, and James W. Clow, secretary, all of New York State.

Western Canada

William Ellis is building a sawmill at Hazleton that will cut 1,500 feet of lumber daily.

The freight sheds of the Victoria Lumber Company, at Chemainus, B.C., have been destroyed by fire.

The Otis Staples Lumber Company are erecting ten model cottages for their employees at Wycliffe, B.C.

The British Columbia Gazette gives notice of the incorporation of the B. C. Timber & Land Company, capital $100,000.

A sash and door factory will be started at Chemainus, B.C., shortly. It is said that the factory will be the largest of its kind on Vancouver Island.

The sash and door factory of S. Hill & Son, Saskatoon, was totally de-

stroyed by fire recently. The loss will be heavy, as a large stock of lumber was carried.

Campbell & McKay have opened a lumber yard at Salmo, B.C. They also intend to erect a sawmill near the town, on limits owned by Mr. Campbell.

The B. C. Casket Company propose to establish a manufacturing plant on some location on Burrard Inlet. They will utilize British Columbia timber in the manufacture of the caskets.

Negotiations are pending for the purchase by an English company of the Dundy Lumber Company interest at Three Valley, B.C., and the timber limits of the Eagle Valley Lumber Company.

The combined lumber mills on the North Arm of the Fraser are petitioning the Dominion Government to have the river deepened to 15 feet. Boards of Trade of neighboring cities are supporting the request.

Fire completely destroyed the plant of the Selkirk Match Company at Selkirk, Man., recently. The loss was $25,000, with only $2,000 insurance. On account of the heavy loss the company will probably not rebuild.

A new issue of Dominion Sawmills £800,000 6 per cent. bonds at 85, is being placed by the Canadian Bank of Commerce and Lloyds, bankers on the Canadian Board at London, Eng., for McRae, Hodges & Munday, British Columbia.

Another British Columbia lumber proposition shortly to be launched in London, Eng., is the British Empire Timber Company, of which $500,000 seven per cent. preference shares are about to be issued to the public at 97½, through Parr's Bank.

The Rat Portage Lumber Company have decided to add two more storeys to their plant in Norwood to meet the demands of increased trade. Other improvements will be made to the plant, the present capacity of which is 3,000 windows and 1,000 doors daily.

The B. C .Gazette gives notice of the incorporation of the following companies: E. C. Atkins & Company, capital $600,000, incorporated to carry on the business of saw manufacturers, machinery, tools, etc. A. C. Frost Company, capital $10,000, incorporated to construct logging railways, electrical works, tunnels, etc.

Robinson & McKenzie, of Cranbrook, B.C., have taken contracts for the supplying of logs for the Sovereign Lumber Company, of Savona, for both the Savona and the Annis mills. Camps will be opened on the Shuswap lake limits, controlled by the firm, and a large number of men employed. It is the intention of the firm to erect a sawmill at some point on the South Thompson, when a suitable site can be procured.

The buildings at Mackinnon's logging camp at Knox Bay, Thurlow Island, B.C., have been destroyed by a bush fire. The employees of the camp lost everything but the clothes on their backs. None of the camp equipment was damaged. A fire had been running in a westerly direction through a slashing —and away from the camp—for two weeks before, and not much attention had been paid to it. The wind veered, however, and blew strongly from the southeast, driving the flames back on the camp.

The plant of the Pacific Coast Sulphide Pulp Company, at Swanson Bay, B.C., closed down recently. About 40 men were thrown out of employment. It is uncertain when operations will be resumed. The control of the company is held by English capital. Mr. Mackinnon, of Vancouver, the organizer of the company, resigned the general managership several months ago. He was succeeded by Mr. James Wood, of Newcastle-on-Tyne

Mr. Maurice Quinn, a wealthy American owner of 35,000 acres of some of the richest timber land on Vancouver Island, paid a brief visit to Victoria recently, returning from a trip of inspection to his holdings in the neighborhood of Alberni. Mr. Quinn has held his timber acreage for the past nine years. His present visit to the coast is for the purpose of finding out about the prospects of transportation in and around Alberni, and it is understood that as a result of his visit he will form a syndicate of capitalists to erect a sawmill and commence shipping timber from the western terminus of the E. & N. Railway.

Important work in the Dominion railway belt between Revelstoke and Kamloops, B.C., will be undertaken this summer by the forestry branch of the Department of the Interior. It will include a report on the suitabiltiy of that region for general agriculture and fruit growing, as well as the collection of data as to the best points for making forest reserves in order to conserve the timber and the water supply. The work will be in charge of Mr. G. A. Cronie, of the forestry service. He will be assisted by three forestry students of the University of Toronto. Mr. Cronie will begin his work at Revelstoke. He is a graduate of the forestry department of Yale University.

The National Paper Mills, Limited, a newly organized company with head office at Vancouver, B.C., proposes to erect in the vicinity of the city a paper mill with a very large capacity. Among those interested are Hon. F. Carter-Cotton, M.P.; James A. Mitchell, John A. Lee, mayor of New Westminster, and L. D. Taylor, mayor of Vancouver. Most of the pulpwood required, it is expected will be obtained from the Fraser River Lumber Company. Mr. Charles J. Kay, Vancouver, who has had 20 years experience in the paper making business, is to be manager of the company, and Mr. Sylvester Cropper, who has had 30 years experience, will be general superintendent.

Messrs. Robinson & McKenzie, formerly sawmill operators at Cranbrook, B.C., have secured one of the largest logging contracts ever undertaken in the interior of the province. They have contracted with the Monarch Lumber Company, at Savona, and the Sovereign Lumber Company, at Annis, to deliver in boom on Shuswap lake one hundred million feet of logs at the rate of 20,000,000 feet each year for five years, the total value of the output being over $700,000. The contractors already have one camp established at the head of Seymour Arm, in which district the limits from which the logs will be drawn are situated. Other camps will be opened as soon as possible and all modern appliances will be used for getting out the logs.

The Swanson Bay Forests Wood Pulp & Lumber Mills, Limited, recently incorporated at a million and a half capital, has ambitious plans for lumbering in British Columbia. The company, formerly styled the Canadian Pacific Sulphite Puly Co., comprised of English men, has been operating under a provincial license from the British Columbia Government. The increase of capital amounts to about 75 per cent., most of it being subscribed in the old country. Now that a Canadian charter is obtained, five prominent lumbermen residing in Ottawa and Montreal will comprise the Canadian directorate. The names of these men will not likely be announced. The company after four years' operation found that it could reduce the cost of production by expanding the business. Thousands of acres of timber limits are under control. The output of the mills is pretty well contracted for ahead. There is no intention of going into the manufacture of paper.

For Sale to Close an Account
Crown Granted Timber Limits and Lands

in the

Province of British Columbia, Canada

The undersigned has received instructions from the owners who desire to close the account, to sell by private treaty

Forty Timber Limits and Lands

situate in the Salmon River Valley, West Kootenay, British Columbia, from thirty to forty-five miles north of the United States border, and upon, or contiguous to the Nelson and Fort Sheppard Railway which runs between Spokane, Washington, and Nelson, British Columbia, connecting with the Great Northern and Canadian Pacific Railways, and affording access to the United States and Canadian markets.

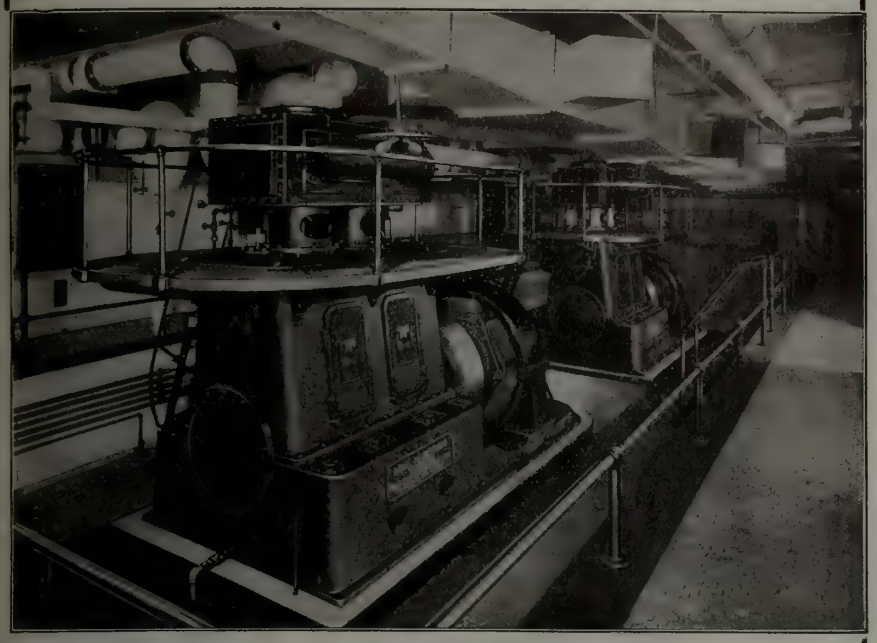
The limits contain in the aggregate thirty-eight thousand acres, and are comprised of bottom lands and benches of hills, constituting one of the best bodies of timber in the Central Southern part of British Columbia. Subdivision of the tract has hitherto been consistently refused. Individual limits contain from two hundred and fifty to twenty-one hundred acres, with from three million to forty-five million feet of Cedar, Pine, Hemlock and other woods of excellent quality upon them, in addition to large quantities of Cedar Poles—prices run from $5,000 up according to Stumpage and Location.

Some of the limits are essentially Cedar Pole Propositions, and contain large quantities of the very best quality of Cedar Poles from twenty-five to seventy-five feet in length, free of limbs

The properties are Crown Granted, and the timber upon them may be exported. The Timber is subject to a Royalty of fifty cents per thousand feet, when cut.

A considerable quantity of the land is available for fruit land when cleared, and the owners are prepared to give a deed of land and timber, or a license to cut timber only for a term of years, at the option of the Purchaser.

TERMS OF SALE:



In order to close the account, very easy terms of purchase will be given, namely, twenty-five per cent. cash, and the balance in four equal annual instalments, and twenty per cent. cash with balance in six equal annual instalments—interest at six per cent.—with operating privileges which will assist purchasers to pay for limits out of stumpage.

The character of the properties together with the easy terms of payment present a unique opportunity to persons of moderate means to acquire valuable limits for either operation or investment.

Prices and further information may be had upon application.

YMIR, B. C.

Cost Nothing For Repairs

A customer says :—"We have used one of your vertical high speed engines, English Type forced lubrication since 1907. The engine runs at 425 revolutions per minute almost constantly night and day. It has given us every satisfaction and so far has cost us nothing for repairs."

Largest and Best Assorted Stock of Dry Spruce in Canada

Berlin Quality Counts

What We Offer in a "Utility" Resaw

Several years ago we became interested in the future of the Band Saw business and, after having studied the field closely, established a Band Saw Department, and then proceeded to hire the best mechanical talent in the country.

A careful study of conditions and competitive machines brought us to this fact; that the machines offered were not built as good as possible and then sold at a reasonable price—they were built to sell at a certain price.

We know that a policy of that nature could not make good to the fullest extent. So instead of putting on wheels that are cast (rim, hub and spokes) together, we made a radical departure—actually had STEEL RIMS made elsewhere at a greater cost for the rim alone than we could have cast an entire wheel.

We found that staggered steel spokes in combination with the steel rim, would give a perfectly balanced, very stiff, light running wheel. That was a point scored for us.

Then the straining devices in use at that time were cumbersome, weighted, etc.,—everything but simple. We remedied this by perfecting the simplest straining device on the market. Every part is balanced over knife edges and the force is exerted in straight lines—direct from weight to fulcrum and from fulcrum to upper bearings.

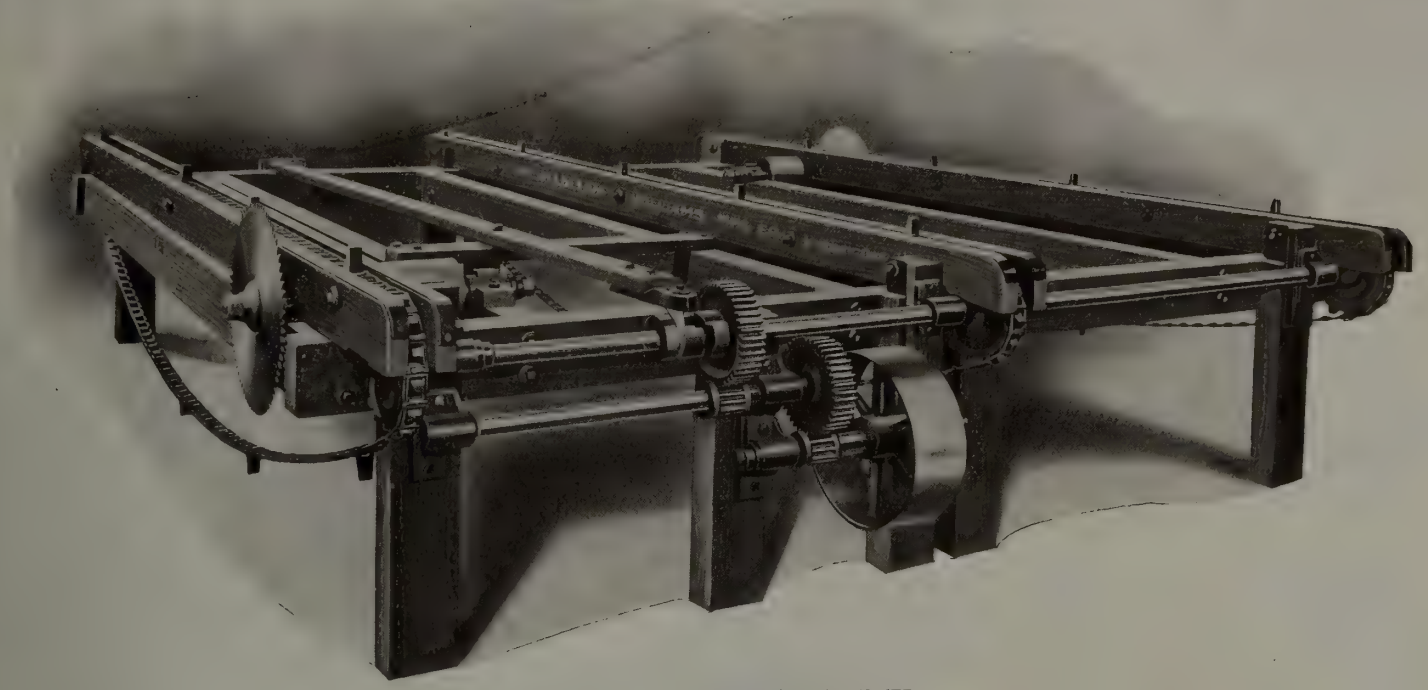
Other points—the superiority of which can be seen by even a novice, are the Variable Speed Device, Safety Saw Guide, Frame Without Overhang, Double Wheel Bearings, Roll Construction—in fact there is no reason why we shouldn't be busy in our Band Saw Department.

The "341", cut of which is shown, carries a 6-inch blade and because of its having the lightest wheels and carrying a short saw, it has the greatest capacity of any machine in its class and in many classes of work, we will put it up against any 8-inch blade.

It has all the good features of our heavy saws combined in a medium priced, medium sized machine. It will do twice the work of a circular resaw and make better lumber. It is the busiest machine in any planing mill or box factory.

But the "341" is just one of our big line. Just write us for details of any kind of a Band Resaw you require.

Ask us to send your operator a copy of our booklet "Fitting and Operating Band Saws." It is a booklet well worth his careful reading.



Berlin Machine Works, Limited

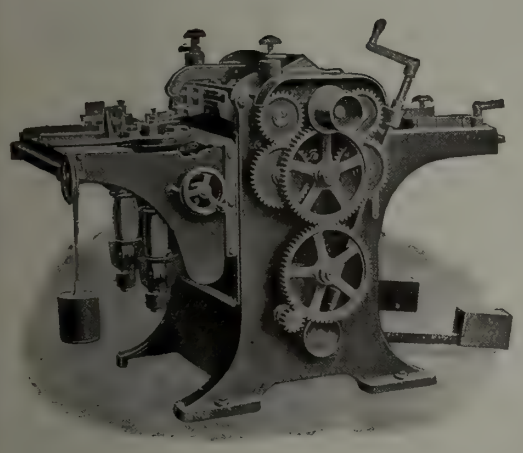
Hamilton - Canada

Builders of Berlin

Sanders, Sizers, Matchers, Moulders, Surfacers, Planers, Jointers, Edgers, Rip-Saws, Re-Saws.

The Trimmer That Trims All Trimmers

POINTS OF SUPERIORITY



THE FRAME is made from 4 inch by 8 inch timber, joints mortised and bolted together
SAWS are 20 inch diameter placed 12 feet apart. Speed 1800 revolutions per minute
FEED which is double geared, is very powerful and can be stopped and started instantly by the operator with a clutch and lever as shown in cut

Mouldings

We make the best line of medium size Planer, Matcher and Moulders on the market. When you buy a Cordesman-Rechtin Planer, Matcher and Moulder you are assured on four points:

1st—That you are getting the latest and most improved machine built.

2nd—That you are getting a well designed, well made machine, and one that won't give you any sort of trouble.

3rd—That you are getting a machine that will do good work and lots of it.

4th—That you are getting a machine that is fully guaranteed.

We make four different sizes and styles of these machines. One of these is sure to meet your requirements.

Write for circulars giving full particulars

RESULTS ARE WHAT COUNT

A Combined Skidding and Loading Machine that will clear up the largest area at a setting and can be moved and set up in the shortest possible time will get the best results.

The latest Russel machine has some distinct features that save time and trouble, consequently money. Note the new method of suspending skidding sheaves. They are hung from a vertically hinged jib or triangle, the outer end of which is guyed by two lines one on each side, which are power-tightened and can be set while skidding lines are going out. The guy lines lead back so they do not interfere with skidding or loading. The uppermost leg of the jib has a spring connection to the tower, reducing shocks. All

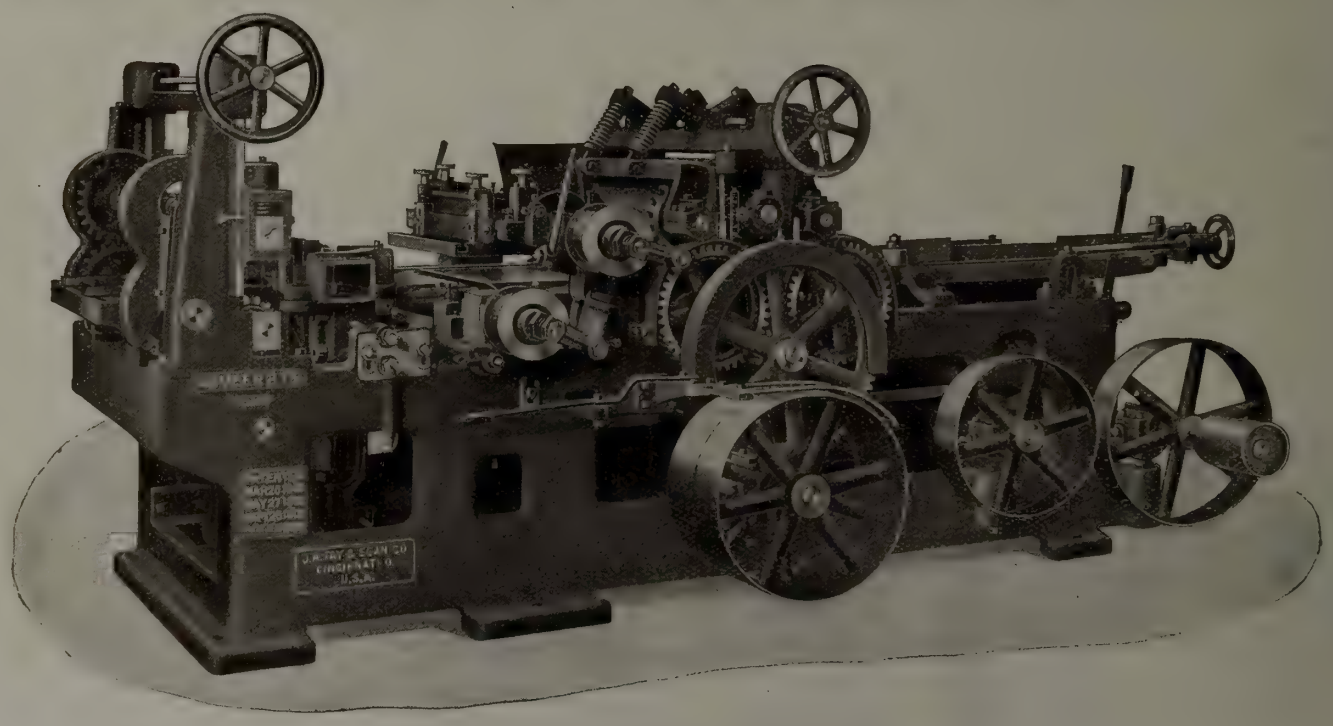
skidding strains are absorbed by the guy lines. The swinging boom is operated by wire ropes passing through sheaves suspended from a steel frame projecting from tower and leading to two drums on loading engine, controlled by one lever. Machine is raised or lowered by hydraulic or patented gear jacks. Built for 2 or 4 lines, with stiff or swinging boom, constructed entirely of steel, except loading boom. Is without question the strongest and fastest machine of the day.

RUSSEL WHEEL & FOUNDRY CO., DETROIT, MICH.

Perfect alignment to the upper in-feeding rolls is absolutely essential to the production of fine surfacing

YOU GET THIS WITH OUR

No. 275 Double Cylinder Planer and Matcher



where the two upper in-feeding rolls are raised and lowered simultaneously by hand wheel, giving neither roll a chance to get out of line

This patented feature together with many others enable our No. 275 to meet the highest requirements of planing mills and other woodworking plants for working in either hard or soft wood.

It will be found a most excellent tool for all such work as Patent Drop Siding, Carpenters' Moldings, Baseboards, Casing, Flooring, etc.

Capacity for material 10—16—20 and 24 in. wide and 8 in. thick

Let us tell you more about this new machine in our large illustrated circular—Sheet No. 8—C

DISSTON Saws

"The Saws You See from Sea to Sea"

Disston Chisel Tooth Circular Saws

A few reasons why they have held foremost place in the milling industry in every part of the world:

Unfailing precision in milling and machining of V in Shank.

The shank or holder fits perfectly, and has a bearing along entire line of socket.

Gauging of bits is so accurate that a saw can be fitted with a new set and put to work without side dressing of any kind—you can readily understand, therefore, the smooth cut that is a notable character of these Chisel Tooth Saws.

Design of the tooth is different from all others. The bit is nearer to the line which gives least resistance in cutting.

After it is cut, the chip will move *downward* with a minimum of friction. Designs which cause wrong chip direction retard power.

Dust chambers are so large they will easily hold all dust that can accumulate in one cut. When chambers are small, they clog and choke down the saw.

Disston Chisel Tooth Saw blades are made of *high grade crucible steel.*

We make chisel tooth saws that are specially adapted for work in all parts of the world and with every kind of timber - bits alone are made in several hundred different sizes, gauges and widths of cutting edges. Size of tooth is varied to suit the work.

VANCOUVER

Our Steam Tension Band Mill will increase the cut of any plant

Because—The top wheel is steam operated and it can be lowered and raised in ten seconds, when changing saws.

Because—A seperate steam cylinder operates the upper guide. Steam is bound to operate faster than any friction drive. Therefore, the oftener you have to move your upper guide, the more time the steam tension mill will save you.

Because—For the above reasons you have more time for sawing.

Send for special catalogue

Pine, Spruce and Hemlock
A full line of dry lumber in stock for prompt shipment. Let us give you our prices for anything you require in lumber.

Pine Doors
We have long appreciated the fact that price is not the only requisite a dealer must seek in placing his order for doors. Poorly manufactured doors can scarcely be considered a bargain at any price.
Door Making is our Specialty
We have equipped our plant with the best door machinery made, and we are turning out doors that **are right in quality and right in price.**
Our doors need no commendation. They prove themselves. They are business builders for every dealer who handles them.
If you have not received our latest quotations on Doors, Sash, and Interior Trim, write us to put you on our mailing list. It will be mutually advantageous.

Hardwood Flooring "Empire" Quality

Just Rockhard Facts

When you want Maple or Beach Flooring of "Empire" Quality, flooring which has made from good lumber and has been kiln dried and manufactured properly, and grades which have not been "blended" to meet price competition—send us your orders.

Competitive stock bought at a lower price is not a good advertisement to you if it results in a dissatisfied customer who will soon forget the diffe ence in price but he will not forget the poor flooring.

Regardless of price our high standard of quality will not be changed, nor shall we try to fool you by mixing grades.

"Empire" Quality results from good lumber, superior millwork, years of experience, and the most careful and systematic attention to detail exactness.

PRICE and QUALITY are not equivalent

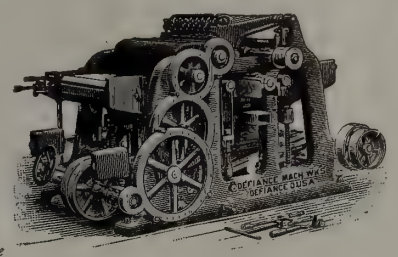
"DEFIANCE" MODERN WOOD-WORKING MACHINERY

FOR PRODUCING

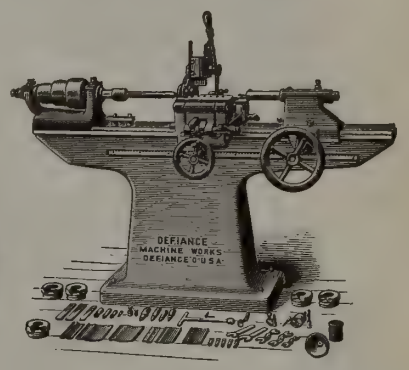
AUTOMOBILE SPOKES, RIMS, WHEELS and BODIES, Carriage and Wagon Hubs, Spokes, Rims and Wheels, Wagons. Carriages, Shafts, Poles, Neck-yokes, Single Trees, Barrel Hoops, Handles of all kinds, Bobbins, Spools, Table Legs, Insulator Pins, Balusters, Oval Wood Dishes and for General Woodwork.

Insulator Pin Lathe



26 in. Single Surface Planer

Invented and Built by



THE DEFIANCE MACHINE WORKS

Defiance, Ohio

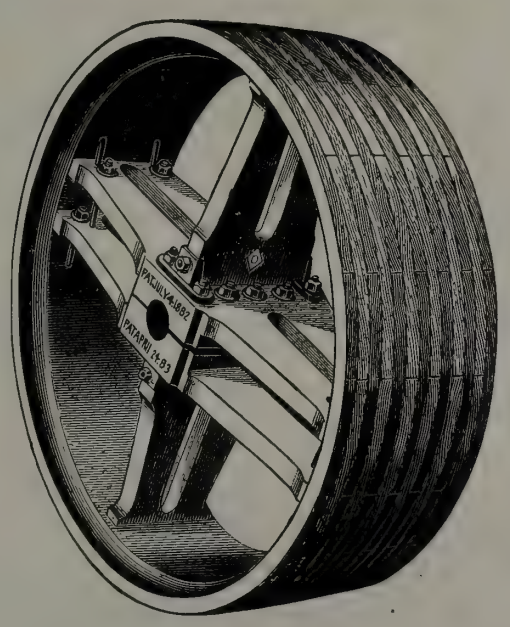
Send for Catalogue

Hoop and Basket Strip Cutter

Variety Turning and Boring Lathe

Pulleys for Saw Mills

Every pulley is thoroughly nailed



Every pulley is guaranteed for heaviest Double Belts.

Our Arms and Hubs are made of Hard Maple. Rims Soft Maple.

If for very damp place we bolt the Rims.

Strongest pulley on the market—no Slip.

Send for Catalogue.

We make and sell more pulleys than all other makes put together.

We have the largest and only complete Pulley Works in Canada.

Might as well have the best.

Cheapest in the end !

We also manufacture
Shaftings, Hangers, Pillow Blocks, Friction Clutches, etc., etc.

Dodge Manufacturing Co., Toronto, Montreal

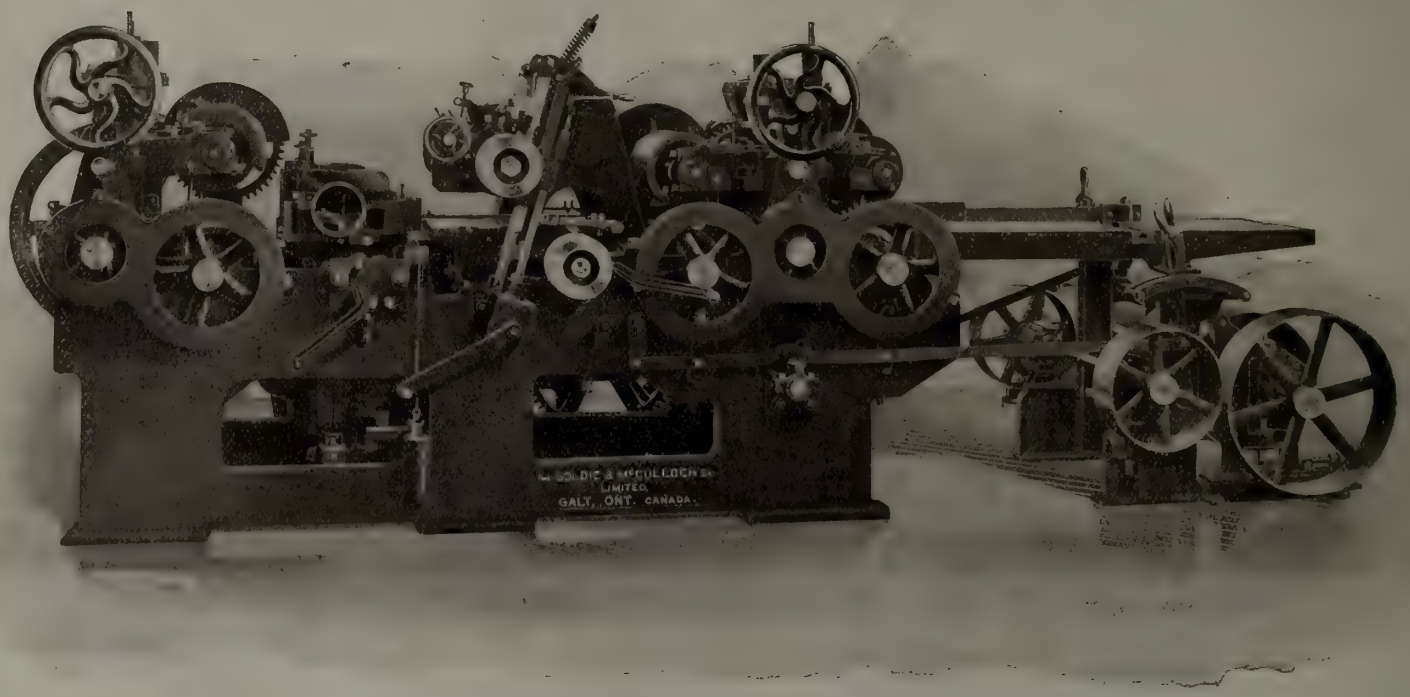
Simonds Saws

There is this, that you can count on, in all Simonds Canada Saw Company's Circular Saws, solid or inserted tooth, whatever the gauge, whatever the tooth, whatever the use—Uniformity.

Buy a Simonds Saw to-day and duplicate your order any time afterward, and you get the same temper, the same material, the same trueness, the same adjustment, the same finish, the same strength, the same cutting qualities, the same all around satisfaction, that you got in your first purchase and that led you to call again for a Simonds Saw.

No time was too long, no effort too vast, no pains too great, for us to take in securing the Simonds Standard of Quality of saw, and there is nothing on this globe that can hold us back from maintaining the uniformity of that standard.

We make every kind of Saw used in lumbering and mill work, and on woodworking machinery, Cross Cut, Band, Gang, and Solid and Inserted Tooth Circulars.



(To buy right—let your order read Simonds)

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For Manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 30 Toronto, July 1, 1910 No. 13

Association Movement Growing

An important sign of the times is the tendency among lumbermen and those engaged in the manufacture of wood into finished articles to fall into line in the matter of forming Associations for the promotion of their mutual interests. One of the latest of these is the Association formed by the Retail Lumbermen of Toronto, who have become an organized branch of the Retail Merchants' Association of Canada. It is now proposed that the Retail Merchants' Association should undertake the formation of a Retail Lumbermen's Association for the whole of the Province of Ontario. That there is need for such an organization is clearly proved by the letter appearing elsewhere in this issue from Mr. Patterson, of the Patterson-Tilley Lumber Company, of Hamilton, Ontario. In this letter many of the difficulties which now interfere with the development of trade are dealt with succinctly. Coming from Mr. Patterson, they will be received as authoritative. It does not need the authority, however, of an important member of the trade to prove the necessity for such an organization. The example of the Western Retail Lumbermen's Association is instructive This Association has prospered in a manner which the most sanguine of its originators did not expect. It has resulted in incalculable benefit to the members of the trade, and by the formation of a mutual insurance company, as a branch of the association, it has enabled the members of the retail trade to secure their insurance at cost prices.

There is no reason why the retailers of Ontario should not have an equally useful organization. The wonder is that one has not been in existence for some time already. Probably, the main reason has been that in the past the Government has made it extremely difficult for associations to be formed, the object of which had any resemblance to the regulation of prices. Illegal restraint of trade has been made a great deal of in the press, and retail lumbermen have perhaps been restrained from protecting their own interests in a legal manner through fear of overstepping the law. This has all been changed of late, and the law as it stands at present makes it possible for retailers to form associations for the reasonable development of their mutual interests without any danger of breaking the law.

Another indication of the growing interest in the formation of trade associations is afforded by the report, also published in this issue, of the recent meeting of the Sash and Door Manufacturers of Ontario. They have been carrying on business for several years without obtaining profit, and have at last decided that it is time to go out of business or else to make some money. By the time this issue is in the hands of its readers they will have drawn up a new list of prices on sash and doors, and will have approached the question of rearranging the grades.

There are those who fear that it will be impossible to maintain a price list, but it seems reasonable that this plan should at least be given a good trial. There is no doubt that the people of Ontario require large quantities of sash and doors, and that they have enough money to pay prices which will afford reasonable profits to the manufacturers. If by getting together for the development of their mutual interests the sash and door manufacturers can effect the formation of an association which will assist them in obtaining a reasonable profit, they will have done a service not only to themselves but also to the lumber manufacturing industry as a whole.

Canadian Flotations in London

It is interesting to note the attitude of the English investing public towards the Canadian lumber stock flotations now being promoted in London. Quite a number of British Columbia companies are now being brought out in London in the hope of securing English capital, and an extensive advertising campaign is being carried on in connection with them, in the daily newspapers. The time is perhaps a little inopportune on account of the recent rubber and oil flotations, which have attracted and locked up a good deal of the money which seeks a speculative investment. One of the larger promoters is sending an expert to British Columbia to report upon the properties, however, and everything possible in the direction of securing publicity is being done.

In view of the large amount of United States capital that has gone into the British Columbia lumber business, it is high time that a systematic effort was made to have English capital come in also. It has been a matter of regret to Canadians in the past to see so much of the profits from their valuable timber going to foreign investors. It has seemed like selling one's birthright for a mess of pottage. If good properties are placed on the English markets now, and sane promotion is practiced, perhaps in the course of a few years the tables will be changed. Nothing would please Canadians more than that English capital should secure the major share of the timber in British Columbia, unless it were that Canadian capital could be found to do the work. At the present, Canadian capital is too scarce, however, and too tightly locked up in the other great development projects of the country. There seems to be no more promising and fitting field, therefore, for English money than British Columbia timber.

There is urgent need, however, for the exercise of extreme caution in this matter. Over-capitalization or lack of caution in the selection of timber properties would endanger the whole future of the English capital in British Columbia timber. At the outset, it is devoutly to be hoped that care and conservatism will give the movement a healthy start. That the situation is being approached in a reasonable manner is indicated by the references in the financial press of England. A London despatch from an important source, after discussing the recent oil and rubber flotations, and comparing them with British Columbia lumber, somewhat to the advantage of the latter, says:

"It is the most absurd nonsense to imagine that a lumber market can be made in the same way as rubber. The former precludes gambling on any large scale, and it would be a thousand pities if sound lumber investments came under the head of a gamble in stocks.

"The prospectuses of the companies asking for subscriptions are

likely to undergo very severe scrutiny, as the English investor does not know very much about lumber and is in a very different position to the American investor, who deals in timber limits and lumber milling propositions very much as the investor here deals in municipal securities. There is no reason at all why British Columbia lumber projects should not be financed on this market, but the issues are likely to undergo closer inspection than even British Columbia mining projects. Lumber does not appeal to the British investor in the same way at all as oil, rubber or mines. There is no likelihood of the shares in a lumber company going to an immense premium, there is no speculation in what lumber will and will not do. There is, in fact, no elasticity in lumber, and the investor will demand a definite statement as to what the companies asking for money have done or are doing in the way of earnings.

"Another matter that has to be taken into account is that the rubber boom has practically exhausted the market with its speculative frenzy. This does not mean that there is not plenty of money for investment in sound securities, but that the excitement has subsided, and although as yet there has not been any serious fall in the price of rubber shares, some people are anxious to take profits, and find that they are not able to get the profit they hoped for. Many of those who bought the last issues at a premium are facing slight losses, but they are holding on to their shares, believing that the market will recuperate. For the time being the market is not in a very good condition to absorb more stocks, and anything of a speculative nature is likely to find some difficulty in getting subscriptions. It will be interesting to see how these lumber issues are absorbed, although the promoters may find it more profitable to wait a little while before attempting to float them. Meanwhile no harm is being done British Columbia by the publicity it is getting."

Timely Advice upon Precautions Against Fire

In the matter of fire prevention, good advice is never out of place. In the last issue of The Canadian Lumberman a list of rules enforced by a large lumber company were published, and they contained some very practical ideas in concise form. Further suggestions along the same line are given herewith, which, like those of the previous issue, are culled from practical experience:

Spontaneous combustion, among other things, is a frequent and unnecessary cause of many fires. When once any discarded machinery or refuse of any nature is put away in a corner, this corner will soon become a dump heap for all sorts of cast-offs. In the course of time, if there is any old clothing, overalls, or similar garments among the refuse, sufficient heat will be generated to cause spontaneous combustion. Fire of this sort usually smolders for some time and is as liable as not to break out in the dead of night when there is no assistance at hand to suppress it. Well ventilated clothes-closets should be provided, and anything which is not in use should be properly disposed of.

Many a serious fire has been caused by a parlor match ignited by mice or by the heel of an employee. Workmen should be especially warned to use all due care to prevent fires of this nature. Matches should never be left in the pockets of work-clothes or any other place where they are liable to fall to the floor, or to be visited by rodents.

Watchmen's lamps of inferior make are often responsible for conflagrations. There are so many different kinds of absolutely safe lamps, burning non-explosive oils, that accidents of this sort appear inexcusable.

Carelessness in boiler houses is very often responsible for a great deal of trouble. Fuel is frequently piled entirely too close to the boiler front, a sudden back draft emitting sparks which, unless promptly extinguished, might easily start a serious blaze. Firemen are not always careful to see that feed-pipes are removed from fire holes in the boilers the instant they are not in actual use, or whenever fans are stopped. In this way sparks frequently run back to rust collectors. Dust accumulated on boiler tops is very often known to dry out and char to such an extent as to ignite and spread fire to surrounding woodwork.

Frequently fires are caused by friction from overheated bearings. The danger from this source is so evident as to require but little discussion. Proper oiling and examination for frictional irregularities is about the only remedy.

The small fire-fighting apparatus usually found in connection with a saw mill should always be kept in complete repair. Not only should the main parts be kept ready for immediate use, but such small things as hose couplings, wrenches and nozzles should be frequently examined. Rusty iron nipples on hydrants can be put in proper shape with kerosene oil, or, better still they should be replaced by brass nipples. Hose should always be kept attached to the hydrant, and an extra supply be conveniently near for immediate use.

Scattered or badly piled timber in yards or sheds is not only unnecessary, but a dangerous proposition. Sparks are always more or less in evidence in the atmosphere around a sawmill, and the more compact the piles are the less danger there is of ignition.

As a final suggestion, this bulletin states that more time and labor is lost each year in filling empty barrels from which water has been lost by evaporation or by other causes, such as stock drinking or by trash accumulating in the barrel, than would be consumed in providing suitable covers for all.

Forest Destruction in Algonquin Park

Very similar to the difficulty which the Government of Ontario has recently encountered in connection with the cutting of the trees in Rondeau Park, is the outcry which has been made in connection with the cutting of timber in Algonquin Park. In both cases the interests of the public are at stake, but in the case of Algonquin Park, the objections which have been raised are much more than an outcry against a proposed thinning out of the trees. Unless the Ontario Government takes some immediate and firm step, ruination will result to one of the most valuable assets of the Province. Before the area which is comprised in the Algonquin Park had been set aside, in 1893, the Government of the day sold the right to cut timber in various townships, which have since been included in the Park. In some cases these licenses included the right to cut, not only the pine, but the spruce, hemlock, black and yellow birch, cedar, ash and tamarac. These licenses have now been secured by parties who have commenced to work them, and the Government is face to face with a serious dilemma. There seems to be only one course open to them. Confiscation is out of the question. To limit the rights of the license holders is also impractical. If the timber in these sections of the park is to be saved, it is up to the Government to spend some money. Naturally the owners of the licenses will want a good round sum for relinquishing them, as there is much valuable timber upon the limits. The Government will have to pay a much greater figure than they originally received for the licenses. But what of that? They frequently talk about the unearned increment which the lumbermen are alleged to be obtaining from their licenses, and lately they decided to share in this increment by increasing the ground rent and stumpage fees on the old licenses. Now, when public sentiment calls upon them to save the timber of Algonquin Park, they must take the logical position and recognize that in order to secure the license again they must take into consideration the unearned increment when deciding upon the proper price to pay.

It need not be greatly feared that the owners of the limits, realizing the unpleasant situation in which the Government find themselves, will insist upon an extortionate price. Public sentiment will come into play in this matter as much for the protection of the Government as for the protection of the park. If the Government will take this matter up seriously, they will doubtless be able to reach a solution of

the difficulty which will commend itself to the people of the Province. The value of Algonquin Park is too great now to permit of its being injured. The licenses cover land right at the headquarters of the park. Visitors to the reserve will find—unless the cutting is prevented—a great barren area of rock and soil to greet them upon their arrival. The attraction of the park will be destroyed, and it will be a mere matter of time before all its other value as a game reserve and a source of protection to the watershed of the Province will be forgotten. The aesthetic beauty of the park is the root of its popularity, and unless it presents attractions to the eye the public will not long put up with the expense of maintaining it. The very life of the park is at stake, and the Government has no more pressing duty than to solve this problem immediately. Unless this is done they will have caused a great waste of our natural resources.

Insurance of Lumber Stocks—The Retailer's Duty

The relation of the retailer to the manufacturer is a matter of great concern to all classes of trade. In the lumber business it is more important almost than in any other, because the retail lumberman's relation to the wholesaler is almost entirely one of credit. Does it occur to the retailer as often as it should, that this credit relationship involves duties which are all too frequently neglected? Does the retailer, as a rule, lie awake at nights worrying about possible losses of his stock by fire, or does he say to himself, "Well, after all, the manufacturer still owns the lumber, so why should I care if it burns." These are only questions, not statements, and while there are many retailers who realize their situation correctly, there are also, it is to be regretted, many who do not take a proper interest in the welfare of the wholesalers who have given them credit

If a retailer has secured lumber upon credit, it is up to him to see that the lumber is well protected against fire by insurance. Not only should sufficient insurance be carried, but every possible precaution should be taken against the occurrence of fire. It is unbusinesslike for a retailer to neglect his insurance because of the high cost in many of the existing companies, for there are lumber specializing insurance companies which will take their risks at reasonable rates, so long as the merchants will adopt proper precautions

In the section of this issue which is devoted to matters of interest to retailers there is published a copy of a leaflet which has recently been gotten out by the Canadian Lumbermen's Association for distribution among retailers. Manufacturers and wholesalers have been supplied with these leaflets, and will enclose them in their letters to customers. The leaflet is timely and important. It brings the matters to the attention of retailers, and offers the assistance of the Canadian Lumbermen's Association to those who wish to look into the insurance matter closely. The circular is issued, not with the idea of dictating to any one how he shall run his business, but with the sole idea of assisting the retailer. Incidentally, of course, it will be of benefit to the manufacturer or wholesaler. It is recognized by the Association that there are many in the trade who have no opportunities of learning the true character and value of an insurance proposition, and it has been deemed advisable to take this means of placing the services of the Canadian Lumbermen's Association at their disposal.

The Canadian Lumbermen's Association is wide awake to the importance of co-operation among manufacturers and retailers. Only by this means is it possible to work out the elimination of many of the evils which exist to-day. Co-operation alone will effect this service, and it is to be hoped that those retailers who have not in the past lived up to their obligations in the matter of insurance will realize that their own interests, as well as those of the manufacturers who give them credit, are dependent upon their accepting such assistance as this, in the spirit in which it is offered.

Editorial Short Lengths for Busy Readers

An important step toward preserving the forests of Washington from fires has been taken by the state fire wardens in ordering all locomotives to use practical spark arresters. Railroads failing to comply with this order will have their engines stopped from operating by state officials. A great percentage of forest fires are started by locomotive sparks, or sparks from logging engines. The transcontinental lines have generally shown a willingness to take proper precautions, but even the big roads have been occasional offenders, and smaller lines, including many logging roads have never paid any attention to the law requiring spark arresters. The Washington Fire Association, organized by timber owners to protect the forests, brought the matter to the attention of the state officers and the law will be strictly enforced. Other northwestern states will be asked to co-operate in this plan in the hope of saving many thousand dollars worth of timber each year.

Investigation of the records of coroners' reports and inquest verdicts for a period of twelve months past discloses the surprising fact that the men of the B. C. lumber camps give up their lives in their perilous occupation, or are bruised and fatally maimed, if not killed outright, by accidents therein, more often than the followers of any of the other extra-hazardous trades, not excluding railroading, coal mining or powder manufacture. The chance of death with the lumberjack is "all in the day's work." His calling removes him from his family or his friends other than those of the camp; and the fatal accident, when it does come to claim him as another victim in the conquest of the forest, as a general rule is heard of by the outside world days, or perhaps weeks, after it occurrence. Coroners' inquests in the cases of sudden or violent deaths in the logging camps may be roughly computed as in the ratio of one in three of such humble tragedies, the cases of obvious accident being so many that official investigation would be a merely vexatious formality, and therefore is dispensed with. No fewer than three reports of this character were contained in the Attorney-General's mail in one day, two being from Dr. Jeffs, of Vancouver, and the third from one of his Kootenay confreres. These three reports give one a glimpse into the perpetual menace of the logger's life.

Exporters of Canadian lumber, who sell in the United States markets, will be glad to learn that there is a possibility that the Customs regulation requiring detailed tally sheets or specifications in connection with all lumber entering the United States will be rescinded. According to a report from Ottawa, Mr. F. M. Halstead, law clerk of the Customs branch of the United States Treasury Department, recently visited that city on a mission that means much to the Canadian lumbering trade. Mr. Halstead was commissioned by the United States Government to enquire into the operative effects of the recent order of the Treasury Department calling upon all shippers of lumber to give specific details of shipments going across the border. Exporters are called upon to state the size and dimensions and the number of pieces in each carload shipped. It has been represented to the United States Government, not only by the shippers, but by the importers as well, that the regulation involves hardship and annoyance which is not calculated to decrease the price of the commodity.

So far as Canadians can see, this regulation is uncalled for. There may have been cases, even frequently, when the Government lost money under the former arrangements, but this would be an argument in favor of a better preventive service. If a few merchants are unscrupulous enough to try to defraud the United States Customs Department, the trade in general ought not to be punished. Punishment, it surely would be, if the tally sheet regulation were insisted upon. The trade would be put to a serious inconvenience and considerable expense. A great deal of the lumber exported—shorts and sidings of all widths and lengths—are never tallied individually. The cost would be too heavy and the trade would have to terminate. The shipper's invoice sums this class of lumber up by rule. If this invoice were accepted in lieu of a tally sheet, no one would be injured.

Why Canadian Hardwood is Neglected

Lack of Organization and Bad Methods of Manufacturing Lead to Difficulties in Securing Good Stocks — Uniformity of Grading a Necessity

The condition of the hardwood lumber business in Canada to-day is far from satisfactory. One invariably hears, when calling upon a hardwood dealer, that his business is one of the most unsatisfactory and difficult to manage that could possibly be imagined. The reasons for this are many, but they are extremely simple. The manufacturing end of the business has been neglected in the interests of pine and spruce manufacturing. Another difficulty and one which many dealers will say is fundamental is the scarcity in Canada of large stands of merchantable hardwood which are within marketable distance of railways.

The situation as it appears to a well known wholesaler in Ontario was interestingly outlined to a representative of the "Canada Lumberman," who recently called upon him. "The great trouble with the hardwood trade in Ontario five or six years ago or more," he said, "was that there was no system of grading. I would quote on an order to a customer, and he would say to me, 'Oh you are not in it, I can get the same grade cheaper from someone else.' This was so often the case that one became greatly disheartened with the hardwood business. When I would look into the grading on an order which I could not obtain, because the other man quoted lower, I would often find that the other man's grading was also lower. That time fortunately has now passed. They are getting educated now. Of course I should remark that we have no general inspection rules here at all, and this is at the bottom of the whole trouble. We have a sort of general inspection, that is, the trade requirements and sizes covering a certain standard are fixed, but in cases of dispute we have nothing to depend upon. We ourselves follow the National Hardwood Association of Michigan rules, but still they are not recognized here, and things are getting so that before long we will have to adopt a regular set of rules. Years ago we had some kind of rules here, but they are not adapted to present requirements at all. They were chiefly designed for the use of pine manufacturers."

A Hardwood Association for Ontario

The question of forming a Hardwood Lumber Association in Canada was discussed, and the views expressed by the dealer were as follows: "It might be feasible to organize an association of hardwood men in Canada, and if this were done it would certainly save a great deal of trouble. What we need more than anything else is some sort of a standard. Probably if we adopted a set of rules they would be based upon the National Hardwood Association rules. That would be a good foundation to start with, and if we found that any changes were needed, to make them apply to Canadian conditions, this could be easily enough attended to. The chief difficulty in connection with the hardwood business in Canada is that manufacturers find it difficult to obtain large enough supplies to warrant them in establishing expensive mills. The majority of the hardwood obtained in Canada is cut by small portable mills. The manufacturer takes this machine to the timber. Naturally, with such equipment they have not the facilities necessary for manufacturing lumber in the best manner. They cannot begin to approach the successful manufacturing methods adopted in the large pine mills. Of course, if we had sufficient hardwood timber growing in large stands in Canada, this difficulty could at once be overcome. In Michigan they have splendid hardwood mills and they manufacture excellent lumber, but the owners of these mills have immense limits of their own from which to draw their supplies. In Canada, so far as I know, we have nothing of this sort."

Scarcity of Good Hardwood Stands

Some people will tell you that we have lots of hardwood stands, but my experience has been that, although there are fairly extensive stands of hardwood in Canada, they produce a very small percentage of cabinet woods. The territory from which cabinet wood can be obtained is very limited. The best territory we ever had was in Ontario, in the Counties of Bruce, Grey, Essex and Simcoe. These have now been very extensively cut over, and I doubt whether any territory will ever equal them. In Northern Quebec we get a little birch, but I do not think it will handle very profitably. The average quality of hardwood is deteriorating in Ontario. When the timber grew in fairly extensive stands and the country was being cleared, it seemed to be of a much better quality than the timber which is being secured to-day. What timber is left in the older parts of Ontario is so thinned out that it seems to me, for some reason, the trees do not grow as well as they did when they were in large compact stands. In those early days a hardwood manufacturer had only to sit in his office and whenever he wanted the logs he would put up a notice to that effect. Then the farmers in the neighbourhood would immediately commence to bring them in. Nowadays, it is altogether different, and a man has to scour the country in order to obtain logs of even fair quality. Prices are going higher all the time, and we do not get the high grades which we used to get.

"You will see for yourself that it is a serious thing for a man to consider the erection of a mill for the manufacture of hardwood lumber. The average stock of a good-sized hardwood lumber mill to-day would be about 500,000 feet. That is a pretty small quantity, and it would not go far in paying the expenses of a large mill. The average hardwood lumber manufacturer to-day is probably one-half farmer and one-half saw-mill man, working a saw mill as a side line. The only thing he thinks he has to do is to make boards. If you will take a walk through any ordinary hardwood dealer's yard you will find a surprisingly large quantity of badly manufactured lumber. It is disheartening to see how much of the lumber is cut without any regard to its keeping qualities. The logs are all cut up into boards without any consideration of the necessity for cutting out the heart. In the end of many of the boards you will see the heart of the tree, and radiating from it will be great cracks where the lumber has split during seasoning. Wholesale dealers have to put up with this because of the difficulty of getting any supplies at all, and they have constantly to carry on a campaign of education for the small portable saw-miller.

"I think the whole key note of the situation is the scarcity of the timber. The few cases I know of where they have the hardwood they are getting good timber and cutting it in a first-class manner. There would be no difficulty at all in educating the saw-mill-man if he were in business in a large way, but, as he only cuts small amounts and considers it as a side line to farming or some other occupation, he takes very little interest in any educating which the wholesalers may try to give him. I am speaking of course only of the territory with which I am acquainted, in older Ontario and Quebec. I cannot speak of anything north of Soo and up that way.

Clear Lumber the Chief Necessity

"In manufacturing hardwood lumber the most important thing to keep in mind is the quantity of clear lumber you can get out of the log. The more defects there are in the lumber, the greater will be the amount of waste in using it. Inspection rules are all based on this principle, taking into account the quantity of clear cutting that can be got out of the lumber. If I could get 1,000 acres of good hardwood timber anywhere in Canada I would put in a mill, but I do not know where it could be found. Any hardwood mill in Canada with a cut of 500,000 feet would be considered a pretty large mill. In the United States they have mills which cut many times this amount and which produce first-class lumber. It seems to me that on account of the high prices and the difficulty of getting good hardwood we will have to draw more and more on foreign hardwoods as time goes on. We have been doing this now for some years, as is shown by the increasing use of mahogany.

"One of the chief causes of trouble in connection with manufacture of hardwood, as I said before, is the inefficient manner in which it is sawn. One of the principal reasons for this has been the fact that many of the furniture factories have been established close to a source of supply and have taken anything that the mill men would produce. If the hardwood business in Canada is to be brought up to a satisfactory condition both manufacturers and dealers will have to get together in some manner for the purpose of improving the methods of manufacturing and standardizing the grades."

The report of the eighth annual meeting of the National Lumber Manufacturers' Association, which was held in New Orleans, La., on April 19 and 20, has been issued in book form and is a great credit to all who have had a part in its production. The book is given the title of "The Forest and the Sawmill." It is splendidly published on attractive paper and bound in green cloth covers. Every event and speech of the convention is reported fully, and at the end of the book are indexes of the speakers and subjects. Lists are also included of the members and their hosts, the Southern Cypress Manufacturers' Association. Altogether the book is both valuable and interesting.

Attention to the advertisement of the well-known firm of Fleming Bros., chemists, which appears elsewhere in this issue, should prove of interest to readers of the "Canada Lumberman." Fleming's Guaranteed Stock Remedies have become known from coast to coast, and the steadily increasing business done by the firm during the past twelve years testifies to their popularity with the logging contractors and lumbermen generally. A copy of Fleming's Vest-Pocket Veterinary Adviser will be given free to those who write to the firm.

New Freight Tariffs Unsatisfactory

Export Rates on Lumber to Montreal are not Lower on the Whole than Domestic Rates

Ottawa, June 21.—The tariffs filed by the Canadian Pacific and Grand Trunk Railway Companies, in compliance with the order of the Railway Commission calling upon them to re-establish export rates to Montreal which will be lower than the domestic rates, contain no redress so far as the Ottawa Valley is concerned. The C. P. R. presented a complete schedule and the G. T. R a partial one. As far as the new tariffs have been examined they show a reduction of from one to one and a half cents per 100 pounds from Georgian Bay points, but no moderation of the rates from the important lumbering district around Ottawa. The domestic rates from points along the Ottawa River, between Aylmer and Grenville to Montreal, is 5 cents per 100 pounds, and this is exactly the tariff in the new export schedules.

The rates named in the schedule, which is published herewith, include Montreal Harbour Commissioners switching charge (not exceeding $2.50 per car), but are exclusive of other terminal charges in Montreal. Rates from points not named in the tariff, but which are directly intermediate to points from which rates are shown, will be the same as the rate from the next more distant station from which a rate is named. Rates on shipments too long for single cars and requiring more than one car will be 20 per cent. higher than for single cars, but not exceeding 10th class rates. The minimum rate for the first car is 30,000 lbs. for cars 36′ 6″ and under, each additional car under which the load extends to be 2-3 of the single car minimum. The longest car in the series is to be considered the first car. The minimum weight in all commodities mentioned in the schedule will be in accordance with Canadian Classification and will apply to cars not exceeding 36′ 6″ in length, but on cars of greater length the minimum weight will be increased on the basis of 5 per cent. per foot. The minimum weight of pulpwood will be as follows: Cars 35′ and over in length, 40,000 lbs.; cars 35′ in length, 35,000 lbs., except when the marked capacity of the car is less, but in no case will the minimum weight be less than 30,000 lbs.

The following is a summary of G. T. R. tariff filed with Railway Commission. All conditions are the same as those stated in the C. P. R. tariff:

From.	Cents per 100 lbs. to Montreal.
Trenton Junction	10
Toronto	11½
Peterboro and adjacent points	11
Cambray to Haliburton and intervening points (includes Orillia and Midland)	11½
Barrie and Muskoka	11½
Bracebridge and Burk's Falls	11½
Sundridge and Trout River	11½
Powassan and North Bay	11½
Colwell and Penetang	11½
Sarnia and Point Edward	13
Windsor	14
Goderich and Southampton	12½
Wiarton and Owen Sound	11½
Kincardine	12½
Wilno and Algonquin Park and intervening points	10½
Carrol Lake and Whitehall and intervening points	11
Bear Lake and Depot Harbor and intervening points	11½

Ottawa, June 22.—The Canadian Lumbermen's Association to-day took a definite stand against the tariff filed by the G. T. R. and C. P. R. to be collected on lumber shipped to Montreal for export. Mr. Frank Hawkins, Secretary, will point out to the railways that the tariffs filed by them do not comply with the order of the Railway Commission, inasmuch as they are not "on the whole lower than the domestic rates."

The lumbermen contend that an export rate should be re-established that will show the same difference when compared with the domestic as prevailed before the increases. The Grand Trunk has not filed enough of the new rates called for to permit of much comparison. For instance there is no list covering Quebec points. The C. P. R. schedule shows very conclusively, especially in the case of the tariff from points in the Ottawa district, that the schedule does not correspond with the order of the Commission. If the railways do not come to see the matter in this light then no doubt recourse will be had to the Railway Board again.

The railways will also be requested to make refunds on excess export rates charged. It was agreed between the lumber and transportation interests that a settlement of this kind would be made to adjust accounts after the decision of the Railway Commission. The lumbermen claim refund for all sums paid for carrying lumber over what would be collected on a schedule conforming with the ruling of the Commission for lower export rates.

All the evidence in the case of the interswitching rates dispute was submitted to the Railway Commission on June 22 and judgment reserved. The lumbermen are interested in the hearing, though no evidence was heard from them especially The case came up on the application of the railways for interpretation of a clause.

Maritime Matters—Business Dull—Three New Mills

Mr. George Cutler, of the firm of Statson & Cutler, paid a visit to St. John, N.B., recently. Mr. Cutler speaks of the situation in the lumber market as rather gloomy. He states, however, that business is much more satisfactory on the Canadian side of the border than in the United States. Whereas there is almost nothing doing in the United States, the situation is fairly satisfactory in Canada. Mr. Cutler attributes the slowness of lumber in the American market chiefly to a "bug in business generally."

Three new mills on the Miramichi are about ready to begin sawing. J. H. Crandall, of Moncton, has secured a site about a mile above Chatham, and has brought in a portable mill. Mr. Crandall has about two million feet now in the river to be manufactured this year. The mill has a rotary and lath machine, and will give employment to twenty-five men. D. J. & J. D. Buckley have built a new mill at French Fort Cove, just above Douglastown, and expect to begin sawing about July 1. The mill is equipped with a stock gang and rotary, and will have a capacity of from 45,000 to 50,000 feet of long lumber, and from 30,000 to 35,000 of lath. K. & R. Walsh, of Chatham, have about completed the construction of their new mill on the waterfront. The firm are somewhat uncertain as to their future operations, as it is possible that the Government may expropriate their wharf (upon which the new mill stands) to be used in connection with the new Nelson-Loggieville branch of the I. C. R. Should this not be done, the firm will shortly begin the removal of the machinery from their woodworking factory, which stands some distance from the waterfront, to their new building on the wharf. In addition to the machinery from the old plant, they will install a rotary saw for sawing long lumber, and a box shook machine. They have already put in a lath machine and began sawing laths about the middle of June.

Recent shipments of lumber from St. John, N.B., were as follows:

Vessel	Cargo
June 2—S. E. Ludlam, Fall River, Mass..	135,434 feet spruce deals.
June 3—Waegwoltic, New York.....	1,311,000 spruce lath
June 6—Witch Hazel, New York.....	154,053 sup. feet spruce boards.
	36,790 sup. feet spruce scantling.
	51,247 sup. feet spruce plank.
June 6—Rescue, Bridgeport, Conn.....	15,089 sup. feet boards.
	650,000 spruce lath.
	635,000 cedar shingles.
June 6—Nettie Shipman, New York.....	1,100 pieces piling.
June 7—Castano, Brow Head, f.o.....	271,254 sup. feet. hardwood plank.
	2,924,741 sup. feet spruce deals.
June 8—Silver Leaf, Barbados.....	160,000 pine boards.
	300,000 cedar shingles.
June 9—E. Miriam, New York.....	344,969 sup. feet spruce deals.
June 9—Jennie C. Stubbs, Quincy, Mass.	219,285 sup. feet spruce plank and scantling.
June 9—Barquentine Argo, Valencia, Ireland	26,474 sup. feet spruce deals, etc.
June 10—T. W. Cooper, Salem, Mass., f.o.	150,000 sup. feet spruce plank.
June 10—Priscilla, Salem, Mass., f.o.....	139,752 sup. feet spruce plank and scantling.
June 11—Adonis, New York City.....	473,415 sup. feet spruce deals.
June 11—A. & E. Hooper, New York City..	988,000 spruce lath.
	112,047 sup. feet scantling.
	5,026 sup. feet plank.
June 15—Conrad S., New York City.....	1,705,100 spruce lath.
June 15—Benefit, New York City.....	1,603,500 spruce lath.
June 15—Govoate, Havana	3,453 pieces spruce boards.
	3,349 pieces pine boards.
June 16—F. G. French, Boston, Mass.....	143,427 sup. feet spruce plank.
	150,000 cedar shingles.
June 16—Manuel R. Cuza, New York City	1,229,000 spruce lath.

That the supply of news print paper in the United States mills was delpeted since March 30, so that on April 30 there was less than five days' supply on hand, is the gist of a statement recently made public by Herbert Knox Smith, Commissioner of Corporations. The statement on April 1 showed but 19,907 tons on hand; since then there has been a decrease of 1,847 tons. The decrease since April 30 was more than 18,000 tons. The normal consumption per day is said to be about 4,000 tons; the production capacity about 4,125. "It is really remarkable," says the statement, "to note upon how narrow a margin of supply this industry operates. The average stock held by manufacturers in the last 1½ years would not exceed at best three weeks' consumption, while the manufacturers' stock on April 30 would not give more than a week's supply. This situation necessarily tends toward excessive fluctuations in price.

The lumber mill of Calverley & Son, Bows, Mann., was destroyed by fire, with loaded cars on the siding, recently. The loss was $10,000. The mill and machinery were partially insured.

Sash and Door Manufacturers' Meeting

Pressing Problems Discussed—Lack of Co-operation has Disorganized Trade—Plan Proposed for Improving Trade Conditions—Alterations in Grade and Prices Suggested

A meeting of the Sash and Door Manufacturers of Ontario was held in the King Edward Hotel on June 15th, at which tentative arrangements were made for improving trade conditions and preventing a great deal of the price-cutting which, during the last three or four years, has entirely prevented manufacturers from obtaining a profit. At the invitation of Mr. F. W. Brennen, of Hamilton, the following were in attendance: Alfred H. Diver, Trenton; W. D. Cargill, Cargill; J. R. Eaton, Orillia; Charles M. Richardson, representing the Gilmour Door Company, Trenton; A. E. Dyment, Barrie; R. J. Batt, Toronto; John Jenness, representing James Davidson, of Ottawa; J. E. Gardiner and J. Evans, representing P. W. Gardiner & Sons, of Galt; F. Buchanan, representing Lloyd & Sons, Wingham, and R. Truax, Walkerton. A number of other manufacturers in various parts of the province expressed their willingness, by letter, to co-operate in any arrangements which might be made for bettering the condition of the sash and door manufacturing business.

Mr. Brennen was appointed chairman of the meeting, and in opening the proceedings delivered a brief address. He stated that they were now receiving about ten per cent more for their doors than they were ten years ago, and they were making a door which was almost as good as the door of that day. It was at the most only one or two per cent. inferior. During that ten years the price of lumber has gone up rapidly, and was now about 100 per cent. higher. The price of labor had behaved in a similar fashion. Ten years ago they could get a good man for $10 or $12 a week, and now they had to pay $18 or $20, and the men were nothing like so good at their work as they were in those days. He thought they would all agree with him, that they were manufacturing doors to-day at too cheap a price. Some manufacturers feared that if they were to form an association, someone, who was not so particular as the members of the association, would take off about five or ten per cent. from his price and get all the trade. Such a man would be welcome to all he could get, and he (Mr. Brennen) felt sure that the man who cut prices in this manner would soon get the reward he deserved.

Mr. Brennen believed that, so far as an agreement was concerned, the door manufacturers, as gentlemen and business men and men of business integrity, could come to some arrangement which would result in a great improvement in their business. He suggested the formation of an association which could meet once a year or every six months, and at these meetings the members would get to know one another and would discuss all sorts of trade questions, such as the standing of their customers, etc. He referred to the formation of the Lumbermen's Association in Ontario some years ago as an indication of what might be expected from an association of the sash and door manufacturers. Fifteen years ago, before the formation of the Lumbermen's Association, a man would buy lumber from a manufacturer, and would often put in a complaint upon the receipt of the lumber that it was short in measure. The manufacturers were obliged to make a reduction in the price. He believed that, on 25 per cent. of the orders in those days, there was some kind of a rebate paid. He had known one customer who had the reputation all over Ontario of making a living at that sort of thing. The formation of the Lumbermen's Association had been instrumental in stopping that sort of business. It had gone out of date now. If the sash and door manufacturers could form an association of that kind it would give the trade a stimulus, and would make it much more remunerative. If it was the opinion of the meeting that an association ought to be formed, they would have to discuss how it should be conducted, what should be done in the way of improving prices, etc. He hoped the members present would be free with their expressions of opinion, so that they might, if possible, arrive at some kind of an understanding.

Mr. R. Truax, Walkerton, said that he quite agreed with Mr. Brennen about the benefits which had resulted from the formation of the Lumbermen's Association. He, himself, had had a good deal of experience with lumbermen. There had been much reason for complaint among the lumbermen, and he believed that their Association brought about a better state of affairs and made perhaps a few honest lumbermen who did not exist previously. He remembered one occasion on which he bought 17 cars of lumber, and when they arrived at Walkerton they all came in one train, and he found that on those 17 cars there was an allowance due of no less than $750. About a year later he had been in the office of the man who sold him this lumber, and two of the clerks were talking about a shipment which was then being made, of four cars. One clerk asked the other how much had been "put on" to that bill. The other clerk replied only 2,000. The first clerk said that that would go through all right because that particular customer did not measure his lumber.

The Association had done the lumbermen a great deal of good, and if it would be as beneficial to the sash and door men he was thoroughly agreeable to enter into any respectable sort of an arrangement.

He believed that Mr. Brennen's idea in regard to the cost of manufacturing was a very god one. Costs were not figured properly to-day in every factory. This was a mistake, and ought to be remedied. Factory buildings were decreasing in value, machinery was being worn out every day, and there ought always to be a certain amount of profit estimated to cover this depreciation. No man ought to go into the planing mill business without a profit of ten per cent. over and above all the costs of manufacturing. The only way to arrive at this was to get together as they were now proposing to do, only in larger numbers, and to come to some agreement to which they would all be able to give their consent. He did not mean that they should enter into anything in the nature of a combine. He would not have anything to do with a combine himself; but he he believed they ought to arrive at some definite terms of discount which they would give, off the universal catalogue, and that they should all undertake to live up to this agreement. His own company were giving 50 and 10 off for No. 1 and No. 2 doors, and 50 off for No. 3, and they were getting more orders than they could fill, even at that. But they knew that there were some manufacturers who were filling orders at much below that, because two-thirds of their work was tendered upon, and their firm did not secure more than two jobs out of every ten they figured upon. In spite of this, however, they had all the work they could do.

It was only in connection with the doors that they were manufacturing too cheaply to-day, and some basis of discount ought to be arrived at which they could afford to give. Once this was done there would be very little trouble in disposing of doors profitably.

An association of the manufacturers of doors would prevent cutting of prices when times became a little slack. He suggested that they should appoint a president and a secretary, and if a change of prices was being made the secretary would be able to correspond with the members, giving them notice of the change. Also, if any member proposed to make a change in his prices, he ought to notify the secretary.

Mr. A. E. Dyment, Barrie, said that he occupied a rather peculiar position. While he was in the sash and door business the same as the rest of them, the principal part of his business was the manufacturing of lumber. He was a member of the Canadian Lumbermen's Association, and it was just possible that this might conflict with his being a member of the proposed sash and door manufacturers' association. Personally, he would rather see the sash and door manufacturers come together two or three times in a year to discuss their problems, and that at present they should not form any definite association. The formation of an association might be one of the subjects discussed, and if they believed that the thing would work out all right they could organize later on. He promised that his company would give them their co-operation in anything they might undertake of this nature. He was a great believer in men getting together and discussing their problems. He believed that manufacturers were losing a great deal of money by not getting together to discuss matters, instead of keeping their business to themselves. Accordingly, he would like to see something of this sort carried out, whether it resulted in the formation of an association or in friendly meetings. At the present time he would prefer the latter.

Mr. Dyment agreed with Mr. Truax that they ought to have at least 10 per cent., and even something more, of a profit over and above all the costs of manufacturing. Ten per cent. was working pretty close to the margin. He suggested that a committee should take into consideration the cost of manufacturing, and should make up a list, to be submitted to the rest of them. This list could be discussed from all points of view, and those details upon which the majority agreed could be embodied in an agreement, to which all of them would give their consent, and which they would undertake to stand by. He suggested that the chairman, Mr. Cargill, and Mr. Truax should be the committee to prepare a list, not only of sash and door, but of all planing-mill products, to be submitted to the rest of them at a later meeting.

After considerable discussion as to the personnel of the committee, it was decided that it should be composed of Mr. Lloyd, Mr. Truax and Mr. Brennen. Mr. J. E. Gardiner, of Galt, was then appointed secretary. It was decided, also, that another meeting should be held at the King Edward Hotel, Toronto, on Thursday, June 30th. The committee

will, in the meantime, have drawn up their list, and this will be the subject of discussion at the meeting.

This was the conclusion of the regular business of the meeting, and an informal discussion followed, during which it was brought out very clearly that one of the most important subjects to be considered was that of grades. It was the general opinion that the grades, as outlined in the universal list, were too high, and ought to be changed in several respects. Another point which was emphasized continually was the fact that sales were often made of doors of one grade under the class of another grade., i.e., a grade higher. By this means price quotations were greatly disorganized. This will also be one of the important questions for the committee to take up in drawing up a new list. It is not expected that any amendments to the universal list will be made before the end of the present year, as manufacturers have many orders ahead, based upon this list.

B. C. Mills Plan to Invade Prairies

Will Establish many Retail Yards in Saskatchewan and Manitoba—Line Yards Accused of Asking Excessive Prices

Lumber manufacturers on the coast of British Columbia are arranging to invade the provinces of Saskatchewan and Manitoba with lumber retailing yards in order to get into direct touch with consumers in that territory. The millmen declare that the high prices ruling in the existing yards are killing the consumption. At a meeting of representatives of several of the largest saw milling companies held recently in Vancouver, it was virtually decided to organize immediately a company with ample capital to establish retailing yards in the provinces named. This meeting was attended by men at the head of the companies, whose capital is roughly speaking, approximately forty million dollars.

It is planned to have at least fifty yards in operation by the end of the year, and this number will be rapidly increased until 500 are established. It is proposed that the yards owned by the big companies shall be divided into sets of fifty, each set to be a separate organization and have separate management. The lumber manufacturers of the coast are prompted in their action by a desire to get the " drop " on the " big line yards " combination with headquarters in Winnipeg. It is claimed by the coast mill men that the companies owning the majority of the retailing yards in Saskatchewan and Manitoba have unduly advanced the price of lumber to the consumers with the result that the consumption is lessened, and the decreasing demand is a matter directly affecting the mills in an adverse manner.

" While the coast mills have at the present time all the orders they can conveniently handle," said one of the manufacturers, " we all realize that the time will come when the demand will fall off. The high price of lumber maintained by the " big line yards " companies in Saskatchewan and Manitoba is even now causing a curtailment of consumption, and, for their own protection, the coast manufacturers, at a meeting recently, practically decided to establish yards in all towns throughout the two provinces named where line yards companies are now represented. This will mean the expenditure of a large amount of capital and it will take a month or so to get in the field, but we can do it as those behind the movement have ample capital at their command."

" Speaking roughly the opening of yards in the prairie towns by the manufacturers will mean a direct saving to consumers of from $1 to $4 per thousand feet according to the grade of lumber sold The idea has been prevalent among the prairie consumers that the high cost of lumber to them was brought about by the extortionate charges of the manufacturers on the coast. One result of this has been that the prairie people, especially those in the cities and towns, have been forced into utilizing substitutes for lumber in connection with their building operations. Sheet metal for roofing, lathing and even for walls has come into use. The millmen are the great sufferers by this decrease in demand. They now realize that they must get into direct touch with the consumer. With the opening of lumber yards by the manufacturers both the consumer and the mills will be benefitted.

" Another important consideration from the point of view of the manufacturers is that they will be able to hold large stocks in their prairie yards at much less cost for insurance than would be the case were those stocks kept in the mill yards on the coast. We would also be able to move our lumber to the prairie at times when the railways were not congested with traffic, thus ensuring complete stocks at yards at all times. The heavy movement eastward would occur during the dry summer period when deterioration of stock in transit would be greatly lessened.

" With fair prices to the consumer the consumption of lumber in Saskatchewan and Manitoba would rapidly increase, to the great advantage of the manufacturers. By owning their own yards the mills would all be able to readily market what are known to the trade as " odd lengths." The line yard companies handle these " odd lengths " only when able to secure them at great reduction in price, though it must be remarked that in selling them they secure the highest rate. Lumber in odd lengths is just as sound as if cut to what are known as standard lengths, and very often the consumer requires odd lengths, but under present conditions is generally compelled to take standards, and cut to suit himself with much resultant waste, for all of which he pays.

" The capitalization of the company which will establish the yards has not yet been determined, but I presume it will be between $1,000,000 and $2,000,000. Those manufacturers who are promoting the move will offer stock in the company to all coast mills, standing ready to themselves subscribe for all stock which may not be taken up.

" We have no quarrel with the manner in which the line yards of Alberta are conducted, and for that reason have no intention of invading that field."

Besides the lumber mills on Burrard Inlet and False Creek there were represented at the meeeting held recently the Fraser River Mills at Millside, on the Fraser, and the Chemainus Lumber Company, with mills at Chemainus, Vancouver Island.

Pacific Coast Mills very Busy

Lumber manufacturers at Vancouver and New Westminster continue to experience an extremely active demand for their products. The most important demand continues to come from the prairie provinces. Local demand is also very active as a result of extensive building.

The Fraser River Mills shipped during the month of May by rail 5,000,000 feet of lumber to the prairies Their shipments by boat amounted to 2,000,000 feet. Besides these amounts they sent by scows about 1,000,000 feet to Vancouver and surrounding district. The month was a noteworthy one for the company by reason of the fact that during it they sent their first shipment of lumber to South Africa. This avenue of trade is expected to be materially developed. The usual large consignments were sent to Australia, and a fair average to Mexico. Work will soon be commenced on additions to the plant at the big mill that will permit of a very much increased cut. The mill worked overtime during the month. While shipments do not constitute a record for the mill still they are good for this season of the year. The cut for the month was 7,200,000 feet.

The Walsh Sash & Door Factory has never been so busy. During May the factory has been turning out an average of 300 doors a day, and at present there are enough orders ahead to run it for six months. To meet this great demand the company will shortly double its capacity. Among the large orders received is one from the British Columbia Electric Railway Company. The factory is using six cars a day from the C. P. R. for shipments, the majority of which go to the prairies.

The Small &-Bucklin Lumber Company, employing about 200 men at the mill and in the camps, have the same story of activity to report and have been gradually increasing their cut to meet the demands. The capacity at present is about 1,750,000 feet of lumber per month. Mr. Bucklin denies recent stories of the sale of the property to railway interests.

The Royal City Planing Mills, like the other firms, are making large shipments to the prairies. The company make houses and from the character of the orders they are receiving from the northwest a large amount of building is in progress there. R. J. Rickman, the manager, reports that prospects appear very bright for a very busy summer and fall. He states that the local demand has increased to a very noticeable degree this summer.

The Brunette and other mills in the city report business good and a big demand for lumber.

Successful Concatenation at Victoria

Thirty-three timorous " kittens " were duly enrolled in the ranks of the great order of Hoo-Hoo recently, when at the Driard Hotel, Victoria, B.C., the concatenation terminated its labors by a banquet at which over one hundred local and visiting representatives of the lumbering and kindred interests were present. During the afternoon the Hoo-Hoo held the regular concatenation at which was transacted business and the initiation ceremonies were gone through with. Representatives of all the leading lumbering concerns of Victoria, the Island and the Mainland as well as several from across the International boundary were present. This meeting was called for an earlier date, but owing to the death of King Edward was postponed. At the afternoon sessions Arthur J. Hendry, of Vancouver, presided, assisted by W. I. Ewart, of Seattle, who was in charge of the Hoo-Hoo house during the A. Y. P. fair. The next meeting of the Order will be held at Vancouver in the fall. An excellent menu, tasty decorations and a pleasing programme of speeches and instrumental and vocal numbers distinguished the banquet in the evening P. D. Rowe officiated as toastmaster in an efficient manner.

Five British Columbia timber limits have been sold by Mr. E. J. Fader to Eastern capitalists for $80,000. Negotiations are pending for the purchase by Easterners of the remainder of Mr. Fader's holding, valued at nearly three-quarters of a million dollars.

Dishonest Shingle Packing—Its Results

Trade Demoralized by those who put Poor Shingles in Centre of Bundle—Over Production also a Depressing Influence—Strong Condemnation by a Correspondent

Editor "Canada Lumberman":—In your "Editorial Short Lengths for Busy Readers," in the May 15th issue, I catch the sound of a note which, to the lover of good music, bears out upon the air a most unharmonious and unlikeable melody. When your correspondent touched that key he sounded a note which has reverberated from the Atlantic to the Pacific, and which says, in unmistakable terms, "I have been 'stung.'" It is not a pleasant thought at best to be stung, and most of us, I believe, would walk several blocks to avoid the experience. The stings which we used to get in our young days, however, when playing amongst the flowers, or in the clover, were nothing when compared with the sting of which your correspondent complains. No wound hurts as much as one inflicted with a concealed weapon. The little insect that flies amongst the clover carries his weapon, and uses it, as he believes, in self-defence. The shingle manufacturer or salesman who stings his customer by packing in the inside of the bundles a lot of worthless shingles has not the principle of a bee; he has no defence; he takes a mean advantage; and, inasmuch as better things are to be expected of him, he has used a concealed weapon, and therefore is in the same class with the man who extorts money from another at the point of a gun, but is perhaps lacking in moral courage.

Greedy and Unprincipled

This may seem a little uncharitable, coming from a shingle manufacturer, but is excusable when one sees the business which has engaged his entire life, and which should and could be made and kept honorable and worthy of the attention of our best men, being held in reproach and literally dragged in the dirt through the act of some unprincipled, greedy incompetent, who happens to be engaged in the business, and usually in a mighty small way. But small things are sometimes capable of leaving bad odors which are hard to eradicate. There are a number of these little fellows throughout the country, and with many of them it is not a question of how good a shingle they can make, but how many shingles they can get out of a cord—how much worthless stuff they can pack in the bundles and still be able to sell them. They have little or nothing invested in plant, have no reputation in the market as manufacturers, and are only looking to the immediate gains to be made out of the transaction. Not having any connection—no outlet by which they can dispose of their goods upon the unsuspecting customer—they begin to look around them, and they run against a man who is also looking for something easy. He arranges with a number of these alleged manufacturers for handling their combined output, and straightway he goes and rents an office, and perhaps a typewriter; and when he has chosen some high-sounding name by which his company shall be known, and has gotten same neatly printed stationery, with headings which are intended to appeal to the public eye, and which tells the recipient what a large manufacturing company sent it out, and how they make shingles by the million, he has but one other thing to do, and that is to have a number of stencils made for branding these shingles, and sent around to the different mills which he represents, and then he is ready for business.

How the Fraud is Perpetrated

It is easy to understand, of course, that goods which are made without regard to quality or standard can be sold below the price of the standard article and still yield the alleged manufacturers and salesmen a greater profit than the goods which are turned out strictly up to grades. These shingles are passed along by the alleged manufacturer to the wholesaler, when he has found one who will handle them, and from there to the retailers, and thence to the customer—the man who gets stung, just as your correspondent did. It is not long until everybody handling these shingles finds them more profitable than the standard article, except, of course, the customer; but as no guarantee went with them, what can he do? These shingles are, in consequence of their better profit, pushed ahead of the shingle with the standard, but are not offered to the customer any cheaper. They are simply talked more; and soon we find the mills turning out these goods running day and night in an effort to supply the demand, and in so doing they are forced to pick up such help as they can get to fill the double demand upon labor; while the concern that has a standard, and maintains it, is satisfied with running one shift, and keeping a class of mechanics such as they could not hope to secure for any such double demand.

Another cause of this trouble, or one which encourages those whose scruples, or lack of them, allow them to stoop to things beneath the dignity of the trade, is the ever-fluctuating condition of the market. There seems to be far too much enmity between the mills and the wholesaler. The latter is constantly watching the stocks at the mills with a view to enhancing his profits by buying lower and selling at the top price, while the mills are ever watching the stocks in the yards. The wholesaler will not buy until the last moment, hoping thereby to compel the mills to weaken, and the mills are thereby compelled to remain idle for several months at a time. Then, when the stocks have become alarmingly low, the dealers will begin to wire in business which ordinary business intelligence might have enabled them to have sent by letter months before, but for the fact that they were after the scalp of the mills, and looking to their own personal gain. Pretty soon the knowledge becomes public that the yards are depleted, and that So and So had wired in a volume of business; and then look out for squalls! Orders are wired from all directions, and to judge from the appearance of things at this distance one would imagine that the dealers had been sleeping, and had just awakened all at once, and were rushing to see who would get his orders in first.

It is at this moment that the little fellow gets excited, and he immediately plans to run his mill day and night. In order to do this, he runs out into the street and calls in such help as he can find to enable him to carry out his plans. These alleged manufacturers now get together, and in conclave assembled at what they call an association meeting, they predict that there will be a great scarcity of labor, and that wages are going to advance 40% before the end of the season, and that on top of this aggravating calamity there will be a car shortage, for which the railways are of course to blame, because, you know, they should let their cars lie idle for half a year, and then do double duty for the other half.

Too Much Trade Jealousy

If I thought my pastor would allow me, I would say that this sounds like the talk of a lot of damned fools, who are condemning the very conditions which are partly of their own creation, for under normal conditions neither the car situation nor labor take such a serious turn as they immediately do under the abnormal. If there is enough labor to keep the wheels of commerce rolling ten hours a day, and we take it into our heads to roll them twenty hours, does it require a philosopher to see that there will be a shortage? Is it a sign of prosperity for a country to be prepared for these abnormal conditions? I do not think so. If there is an abnormal demand, what obligations are we, as manufacturers, under, religiously, ethically, morally or otherwise, to disjoint our whole system or organization in an effort to meet such demand? Just as soon as a double demand is made upon labor, labor is going to benefit by such demand, just the same as any other commodity; and what could be more reasonable to expect?

Now, if this watchdog method had not been carried quite so far, and some of this business had been sent in earlier, and the wheels kept revolving, or started earlier, there would not have been the long period of unemployment that there was during the winter months, and then this consequent double demand upon labor and cars, which, in the end, is bound to be an affliction upon the consumer.

There is no business as good for the country at large as stable business, and there is no good reason, to my mind, why, in the face of good times, we cannot have stable business, except as hereinbefore described. Somebody is responsible for existing conditions, and somebody has got to pay for them. The trouble is, though, that the burden of paying does not fall upon the right, or guilty, party.

David Harum said that a certain number of fleas are good for a dog. Perhaps so; but, in my opinion, the shingle business, manufacturing and selling, is carrying too many vermin. What applies to shingles applies also to lumber manufacturing.—Donahue.

A large Boston lumber firm, reviewing the market situation, reports, under date of June 20, as follows: The weakening in Eastern spruce is rather usual at this time of year; at least, it has taken place during the last two or three years. The weakening in shingles has gone beyond all precedent for a good many years. The market is in a worse condition than the writer ever remembers seeing it. There seems to be a surplus of shingles pressing for sale. Some of the shippers must have money, and others do not think it is any use to hold them, so the price seems to be constantly dropping. We do not know where it will end. It appears to us some kind of a movement will have to be made to shut down the mills for one or two months, at least, which will be the only thing that will save the situation at all. If they continue to force shingles on the market there will be a steady drop all summer, as far as we can see. There is bound to be a surplus the whole season through, if the mills continue running as at present. This refers to Eastern cedar.

The Retail Dealer and His Problems

Ontario Retailers Should Organize—Insurance of Yard Stocks

The Necessity for a Retailers Association

Editor "Canada Lumberman":—There is to-day a crying need of some understanding amongst the retailers of lumber, and incidentally the planing-mill man. There are hundreds of matters, large and small, continually arising, that could be straightened out at periodical meetings that would establish a better feeling, and go far to arrest the premature wrinkles peculiar to the trade.

There are very few lines of business where there are so many opportunities for the customer to find fault, if he is inclined that way; and it is simply impossible to formulate rules of inspection that will cover all disputes that arise. This is a condition of affairs that exists at present, and which we think could be much improved by concerted action on the part of the trade.

There is also the matter of prices; and if you just consider the experience of the trade in Toronto during the season of 1909, you will certainly find a good argument for an association. Had there been a provincial association in existence, with a representative membership that you might reasonably expect from Toronto, there is no doubt but the cutting of prices would have been stopped long before this belligerent bunch woke up to the fact that the only people who were getting anything out of the scrap was the outside public.

Another matter where there is room for improvement is the rule, or want of rule, in measuring matched stock. The builder frequently turns down the low quotation through ignorance of the wide difference that there is between strip measure and finished measure, which to-day represents 37½% on hardwood flooring with a two-inch finished face.

Still another matter that should be standardized is the finished thickness of dressed material, also the size and position of the tongue and groove in matching. There is no reason why, when you have a portion of a car of matching left over, a consignment from another manufacturer should not fit accurately with the little lot on hand.

There are also the questions of credit, insurance, tariff for delivery, and rules of inspection. This last item alone is entitled to a united and lengthy consideration.

At present it seems to be the rule for every sawmill man to establish his own system of grading, and the worst feature of the case is that this grading is of a decided rubbery nature, and in many cases fluctuates with the demand.

There are also a large number of travellers on the road to-day selling stock who do not hesitate at selling direct to the contractor, and often in less than car lots.

All these matters are simply and easily remedied, and we do not know of any other line of business that allows such abuses to exist.

Thos. Patterson,
Patterson-Tilley Lumber Co., Hamilton, Ont.

Retailers' Insurance—A Matter of Duty

Retail lumbermen will be interested in a leaflet which has just been published by the Canadian Lumbermen's Association, upon the question of insurance. The leaflet, which is self-explanatory, and is to be inserted by manufacturers and wholesalers in their correspondence with retailers, is as follows:—

Essentials!—The lumber business is conducted largely on a credit basis, and credit requires a sure foundation. It is essential that there be a clear understanding between the buyer and seller as to the obligations involved.

The seller is entitled to know whether or not the buyer who applies for credit carries adequate insurance.

The buyer to whom credit is extended assumes an obligation to keep his lumber insured until it is fully paid for. He is in the position of trustee of that lumber, and must run no risks

To be honest to himself, to his family, and to the creditors whose trustee he is, the lumber dealer must use care to keep his property at all times fully covered by insurance.

The importance of this point to the credit standing of the community is obvious, and should need no special emphasis.

Suppose a fire destroys your property to-night, would your insurance enable you to resume operations just where you left off; or would you be wiped out and have to begin at the bottom again?

Your careful attention is invited to the following resolution which has been adopted by the Canadian Lumbermen's Association, 5 and 6 Carleton Chambers, Ottawa, Ontario:—

Whereas: The question of adequate protection by proper insurance against fire demands the most careful attention of every merchant, and is of vital importance not only to the credit standing of the merchant himself, but to those who sell him his lumber and extend credit to him. Be it therefore:

Resolved, That the members of this Association urge upon those customers to whom they extend credit that full insurance be carried, and invite them to correspond with our secretary for advice in regard to their insurance, if they so desire.

Be sure your insurance insures.

Manufacturers Invade Retail Field

The retail lumber dealers of Saskatchewan and Manitoba will be closely affected by the proposal of a number of larger manufacturers of British Columbia to establish at once a number of retail yards in these provinces. The plan, as outlined elsewhere in this issue, contemplates the establishing of 50 yards to commence with, and a rapid increase until the string includes 500 yards. If this plan is followed out, it looks as though the retailers who have established live yards already in these provinces will have a difficult problem to study. The manufacturers claim that these yards have held the price to the consumer too high, and that consumption, even in these piping times of prosperity, is showing a tendency to decrease. The retailers no doubt have their own side of the story to tell, and if it were told it would be something in the nature of a charge that the manufacturers themselves have done all the price-boosting, and left the retailers only two alterantives—higher prices or no profits. Whatever the truth may be, it seems reasonable to suppose that a middle course is still possible. A war to the knife between manufacturers and retailers in these large markets would be a serious matter. Both parties are interested in the same thing, disposing of lumber at a profit. They each know the a, b, c of the consumers' requirements, and should readily be able to reach a conclusion that will avoid serious price-cutting.

The Lumber Press and the Retailer

At a meeting of the yard men of a prominent U. S. Lumber Company, of Keokuk, which was recently held, a number of interesting addresses were delivered. One of the best of these was upon the subject of "The Lumber Trade Press," and it is so interesting that we reproduce it herewith in full.

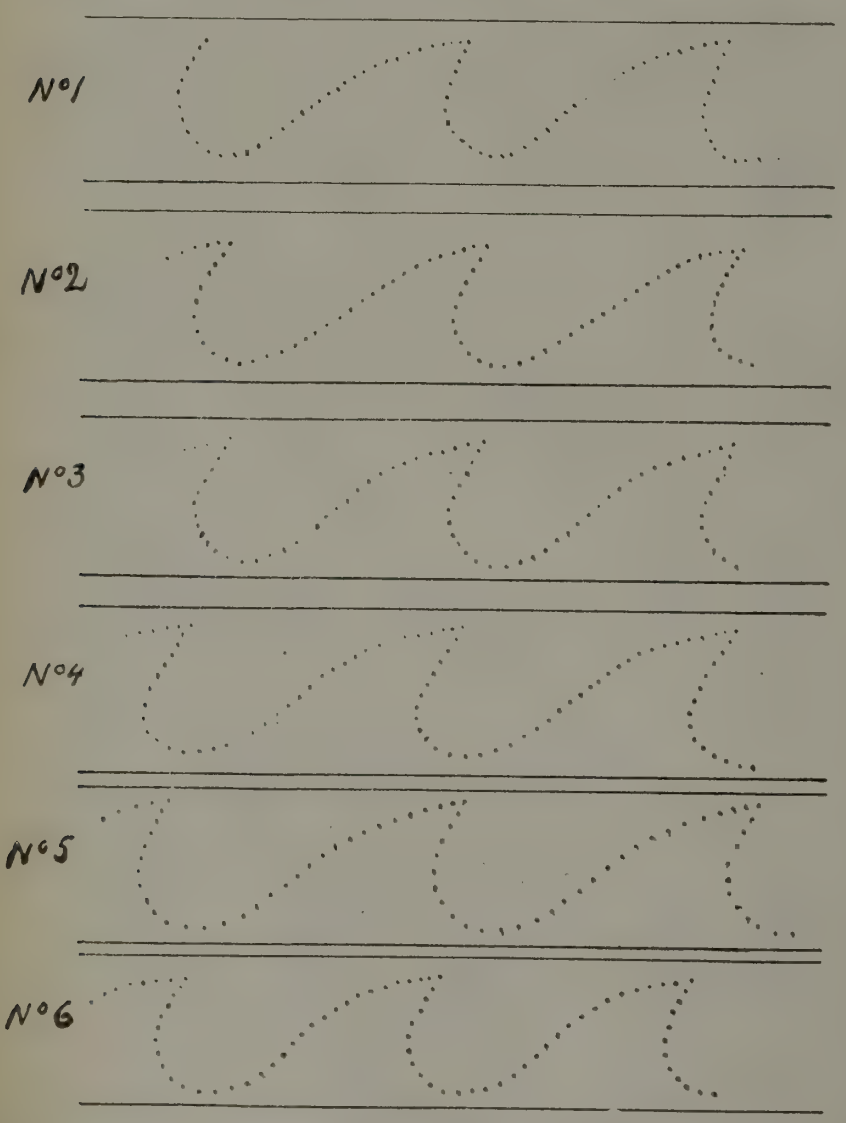
"Men who have failed in a profession often go into business, with the idea that anyone can make a success there. But they find that business is just as much a profession as the law or medicine; requires just as much preparation and as careful thought. This is especially true of the lumber business, because of its very nature. Lumber is not sold in 25-cent packages, nor is it handled as a patented or copyrighted article which is sold by a name or trade-mark. We must figure estimates and bills which run into hundreds and even thousands of dollars. This too often results in competition that drives prices down to a margin that is unheard of in other mercantile lines. A grocer can sell sugar or flour cheap as a leader, and make back the loss on other sales. If the lumberman cuts the price on 2x4-165 it forces a relatively low price all along the line. These very difficulties are what make the lumber business an interesting game.

"I became a traveling man with the same purpose that another man enters a law or medical school—to learn the business. And as I think of it now, almost the main point in making a sale is to keep off the question of price. Talk anything and everything but prices. The continual question of the man who wants to buy lumber is, 'What will it cost?' While we who are trying to make the sale must as persistently draw the attention to the other view of the matter—service and quality. Dollars and cents are too cold-blooded and fixed, while the lumber grades and actual values behind the bids made on any estimate may vary widely. This is well illustrated in mail-order competition, where, on a simple price basis, the catalogue house has a big advantage; but if the customer can be made to realize the quality and service he will receive at home, it is comparatively easy sailing, or in other words, an easy sale for the local dealer.

"And when it actually comes down to prices, show the reason behind the price asked. A regular price, with its why and wherefore, has more pulling power than a very low price without giving a reason for the cut. This all leads to the one conclusion, that we must know more than the mere price of our lumber. We must know the actual difference in grades; what kind of wood and what grade of it is the best adapted to the purpose for which our customer is buying it. We must show the farmer that we know all there is to be known about lumber; that we are professional lumbermen, so that he will come to us

for advice when he wants to build a hog house, the same as he goes to the dentist when he has the toothache, or to a lawyer when his wife wants a divorce. The first question he asks the dentist or lawyer is not, 'What will it cost?' but 'What can you do for me?' We must make our customers respect our knowledge on lumber matters in the same way, so that when we tell him that a certain kind of stock board is the proper thing for his barn, and give the reasons why, he will believe it, and follow our advice.

"But we must actually have this information and expert knowledge of our business. Bluffing will not do. So the question is—Where can we get the knowledge of lumber that will let us place our selling talk on a higher level than just price, dollars and cents?



"The answer is—Read and study every book, paper and trade journal we can get our hands on. No physician can keep up in his profession without continually reading his medical journals. We find information in many different sources, but the lumber journal, with the one purpose of furnishing us with the latest facts, figures and systems, we need. Its different departments cover almost every phase of the business—buying, handling, and selling our stock. The best writers pack the pages with ideas, with which we can again and again turn the farmer's mind away from the Catalogus Company's $14.00 dimension. The retail departments are mighty near as interesting as a Nick Carter detective story, and the department covering Retail Advertising as fascinating to a real lumberman as a love story is to a high school boy.

"The journals keep us in touch with the lumber business of the whole country. We no longer think of ourselves as isolated lumber dealers, each in his own little yard, but we are all part of a great fraternity of lumber merchants. These magazines keep us alive, and place us in the forefront of our profession. This may sound like poetry, but the poetic side of business is a pretty good thing, especially when it increases the dividends at the end of the year."

Uniformity of Practice in Band Mills

Interesting Study of Varions Saws in use in Ottawa Mills—Praise for the Double Cutting Saw—Comparative Diagrams Prepared by I. N. Kendall

Editor "Canada Lumberman":—Dear Sir,—I am enclosing you six cuts, or impressions, taken from band-saws in different mills around Ottawa. No. 1 is from a 15-gauge saw in the C. Edwards Co. mill, single cutting, running at a speed for 9,000 feet, making about 35,000 feet in

10 hours of mixed sizes, but principally 1-inch. I learned that the logs were assorted, the rough and small being cut in this mill, which would in some measure account for the small output. (Prescott mill.)

No. 2 is from a 14-gauge saw in the E. B. Eddy Co. mill, double cutting. It was cutting over 50,000 feet in 10 hours. (Waterous mill.)

No. 3 is a 14-gauge in the Gilmour & Hughson mill, single cutting. It was making about 35,000 feet of spruce, mostly 1-inch, and doing very good work. (E. P. Allis mills, made by Waterous.)

No. 4 is a 14-gauge saw in J. R. Booth's mill, single cutting, making about 35,000 mixed 1-inch, 2-inch and 3-inch. The saws were being fed fast enough in this mill to cut much more, but on account of friction feed and friction nigger canters, much time was lost in working the carriage and niggers. (New Waterous mill.)

No. 5 is a 14-gauge saw in Fraser's mill, double cutting. This mill and a resaw were making about 85,000 feet of mixed lumber, a large percentage being 1-inch. (Telescope mill, by E. P. Allis Co.)

No. 6 is a 14-gauge saw in the Shepherd & Morse mill, double cutting, 2 new Waterous 8-foot band mills and a 6-foot Mershon upright resaw, cutting about 150,000.

There is so very little difference in the shape of the teeth in these six impressions that it is hardly worth mentioning; but as your paper reaches so many isolated places, where an expert saw-fitter may be difficult to procure, and as the above saws are all being fitted by men who thoroughly understand the business, and who have had a long experience with the care of band-saws in all the branches, I thought it might help someone out to have this published. The names of the men who are in charge are: No. 1, James Kendall, for the E. Edwards Co. (single); No. 2, R. Mulligan, The E. B. Eddy Co. (double cut); No. 3, Wm. N. Earls, Gilmour & Hughson (single); No. 4, R. M. McCollum, J. R. Booth (single); No. 5, J. Guer, Fraser's (double); No. 6, Andrew Urquhart, Shepherd & Morse (double).

You will note there are three single and three double-cutting mills; and after close inspection of the lumber from both, I can say with all assurance that the lumber made by the double-cutting mills was in every respect as good in manufacture as that made by the single-cutting mills, the only difference being that the double cut was in each case turning out more lumber. All the saws were running at a speed of 10,000 feet except the first, or No. 1. I was informed by those in charge of the double-cutting saws that saw-makers were grinding their saws almost a perfect parallel in the thickness of the plate, and no trouble was experienced in keeping them in order for double-cutting mills.

The superior nature of many Canadian products is interestingly indicated by a letter written to the Secretary of the National Slack Cooperage Stock Manufacturers' Association, and read at their recent annual meeting. A director of one of the largest mills in the country, if not the largest, wrote to Secretary Palmer as follows: "There is one thing that could be done that would increase the use of barrels, or at least prevent their further decline in use very largely. One of the largest markets for the American flour barrel is South America, Central America and the West Indies. Owing to the humidity of the climate, the wooden barrel is found the safest package in which to transport flour. We regret to say, however, that the competition of the Canadian mills is seriously affecting the trade of the United States mills in those markets. Our company has been very active in endeavoring to secure from Congress tariff regulations that would permit the grinding of Canadian wheat in bond, and shipping the product to foreign countries. * * * If your association was eager to maintain its trade on flour barrels, anything you could do to foster the export trade by the grinding of Canadian wheat in the mills of the United States would be a movement that would not only help the milling industry, but help the sale of your barrels."

Mr. Hugh A. Rose, Toronto, representative of the Canadian Western Lumber Company, formerly known as the Fraser River Lumber Company, Ltd., has been indisposed recently, but his friends are pleased to learn that he is back at work again and in good health.

Canadion Veneers—A Duty Needed

Customs Taxes Placed on Woods of which Canada has no Supply and Omitted on Woods which need Protection

Editor "Canada Lumberman":—Who are the makers of veneers in Canada? If we have no up-to-date veneer plants in Canada, why? There is used in this country $212,000 in fancy veneers per year, and more than this amount of domestic veneers, such as maple, birch, basswood, ash, elm, etc. All the fancy veneers, such as mahogany, walnut, oaks, etc., come in under a 15% duty. These woods are not procurable in this country, but as London, England, is the market for the world's supply of mahogany, it appears to me that we have business enough in Canada to warrant the establishing of a mahogany sawing plant, and import the mahogany flitches the same as they ship them in to New York. However, it is not along the line of fancy veneers that I wish to point out the discriminating arrangement of our Canadian customs, but along the line of woods such as we have in our own country. Of birch, maple, basswood, etc., there is a very large quantity used, in sizes over 3-32 of an inch in thickness, and yet this class of stock is allowed to come into Canada absolutely free, and our own people have to sit and allow it to come in, whereas, if we wish to ship to the States, there is a 25% duty on our stuff.

I ask, then, what does this mean? And the answer is plain. It means that our market, to start with, is small, and that when it is divided up amongst the many factories of the other side, there is absolutely no possible chance of developing the veneer trade in Canada, and no money can be interested in the business under existing conditions.

"The veneer business in this country resembles a horse tethered shortly, with hundreds of wild horses running loose. The tethered horse cannot possibly get a living." We are asked why it is we cannot put a plant in Canada and compete against the Americans. Now, listen. Would you put in a hundred acres of potatoes if there was only one man to sell to, and you were prohibited from leaving your own little patch? The veneer business is unlike the lumber business, inasmuch as veneers are always cut exactly to order, and are never cut and stocked as lumber, because patterns of furniture, etc., change continually. Therefore a veneer man, to handle the business properly, must judge a year in advance for his supply of logs. We would ask who there is in Canada can estimate what veneers he could sell in Canada in competition with all the American factories? To succeed in any business, you must know what your opponent is doing; and how is it possible to tell what a veneer man in the States intends to do in regard to Canada? You cannot form an idea; and the veneer business in Canada is dead, and never will be any better until we have some protection as to our market. A protective duty could be levied, with a string to it—that our prices in Canada must not exceed those of the States. There is not an up-to-date plant in Canada doing business. To prove this, I would ask you to call up any piano, furniture or other veneer user in Toronto or elsewhere in Ontario. They will tell you that they cannot get the class of veneer that is necessary for their work in Canada. Why is this? Simply because we dare not put in the plant, which, as Mr. Innes states, would cost $50,000 to $75,000 for the plant alone, to say nothing about your timber holdings and working capital. The Lake Superior plant at Sault Ste. Marie, costing some $150,000, has been closed this two years. This plant could start in a week's notice, but the small market is so divided up with uncertain competition that there is no way in which the management of the Soo can plan their work. The plant is therefore tied up this two years.

If you will go over to Berlin, Ont., any day at all, I will wager that you will find anywhere from two to six veneer travellers from the States. This is their hunting ground, and a Canadian veneer man would be a curiosity. If there was one happened to be there, he would have some punk that nobody wanted. I tell you, there are no veneer people in Canada doing business to-day to any extent. They cannot do it. I would gladly take carloads of material that are given to the Americans at prices less than what they get for it; but, as stated above, veneers are cut to order only, and you have to keep your supply of logs on hand for such orders, and take chances of getting the orders. This chance way of doing business has never proven a success. Protect the market, and give us as much internal competition as you like in Canada. We would be able to study out the conditions and the wants of the market, and be ready for it at all times. But with the uncertain competition from the other sile, we certainly cannot arrange any definite plans, with the result that we have not got in Canada to-day a veneer plant. We have several plants in Canada cutting basket veneers and cheese-box veneers, and other plants making hoops from elm veneers, and this is the line of work to which Mr. Innes refers in his letter—all cheap veneers, with rude plants. But veneers such as are used in large quantities by the carriage, cutter, piano, furniture and interior fitting manufacturers, etc., are not made in Canada on a scale to handle this trade, and the makers of the above goods will tell you this for themselves.

The peculiar feature of the Customs regulations is that there is no duty on woods such as we have in Canada, but there is a duty on woods we have not got in Canada. In the making of veneers, wages constitute 70% of the costs, the reverse of any other lumber industry. If some arrangement can be arrived at by the Government to give this line of work the protection it requires, several plants will be in operation this coming season, and it will also be the means of bringing in several American veneer mills, but not until an adjustment is made.

A year ago we had an over-supply of elm veneers. We had made our arrangements for the market, but owing to the absence of duty on elm, several cars came in from the other side, and we were forced to hold our goods for the season. There was absolutely no market for the cars at any price. We attempted to look up the American market, and could have placed the entire lot in Syracuse; but on looking up the duty, it was 25%, going into the States. Is this fair?—Janes.

Activity Continues at Montreal

Fine Weather Stimulates Retail Lumber Trade—Export Shipments being Rushed—U.S. Markets Inclined to Dulness

Montreal Office of the "Canada Lumberman,"
June 25, 1910.

The excellent mid-June weather following the period of continual rain has had its cheering effect on trade conditions in general, and the local lumber markets are again giving signs of activity. Especially in the Eastern districts, the retail yards are reporting a lively movement in lumber. One large dealer, speaking to the "Canada Lumberman," pointed out that he was rushed with orders, and business prospects were never brighter. Collections, however, are bound, in quite a few quarters, to be exceedingly slow.

The export men are rushing out their shipments, and the last week of June promises to break all records in point of amounts exported.

Market Conditions

Common spruce is moving freely. Eastern yards are selling this quality of lumber extensively for use in the construction of houses of the cheaper class. Pine in the cull grades is only fairly active, and prices are ranging easier. Good pine lumber is quite scarce and almost unobtainable. Hemlock lumber shows signs of picking up, and the present demand, while not brisk, exhibits considerable improvement. Lath continue to command good prices under pressure from a constant and health demand. The shingle market shows little improvement.

The demand for hardwoods in the local market is reported fairly active. Basswood is selling well at firm prices. One inch dry birch is frequently enquired for, and all grades of birch are wanted at present by the American market.

New York Market—The New York district lumber markets are reported only fairly active, with retail and consuming channels buying in moderate quantities. Enquiries are showing evidences of picking up, and the indications are that there will be an average amount of buying during the coming summer months. Arrivals of Eastern spruce are readily marketed at firm values. On the other hand, West Virginia stock is quoted as much as $3.00 off the list prices. Hemlock is selling fairly well, with the bulk of demand coming from suburban yards. The hardwood market continues firm, and is easily the feature of a fairly dull situation. Good hardwood lumber is not plentiful, and the prices obtained are satisfactory. Low-grade stock is also moving. The outlook is for a stiff market for the balance of the season. The yellow pine market is brightening up, and orders and enquiries are coming in more freely.

Personal News and Notes from Montreal

Mr. Geo. W. Goodfellow has returned from a business trip through Western Ontario.

Mr. H. Bourgouin, lumber merchant, St. James Street, has returned with his family from a very pleasant winter spent in Paris, France.

Mr. A. H. Johnson, of Collingwood, Ontario, manufacturer of lumbermen's specialties, was in Montreal recently, and paid a visit to the office of the "Canada Lumberman." Mr. Johnson is on his way through the Maritime Provinces for an extended business trip.

Mr. E. H. Lemay was in New York last month, and visited his selling representatives, W. M. Crombie & Company, 81 New Street. Col. W. A. Crombie, of this latter firm, recently visited Montreal and several of the important Canadian mill points, spending considerable time in this neighbourhood, in the interests of his firm.

Mr. Wm. T. Mason, of Messrs. Mason, Gordon & Company, has returned from a business trip through Ontario as far West as Fort William. Mr. Mason reports trade in this district fairly brisk. During his trip he booked several nice orders for his firm. The prices of

yellow pine and British Columbia fir, as well as oak timber, are holding firmly, nearly all mills being well filled up with orders, which will keep them busy for some time to come.

Messrs. Mason, Gordon & Company recently sold a large order of Southern pine to the Canada Car Company of Lachine. This lumber will be used for car sheeting. Two extensive cargoes of yellow pine arrived in Montreal recently by steamer from the South. These shipments were consigned to local firms and were placed through Messrs. Mason, Gordon & Company. This company are at present loading a cargo of yellow pine, comprising approximately two million feet, at Savanah, Ga. Included in this is a large consignment of creosoted timber, which will be used by the Government in the construction of docks on the Atlantic coast.

A deputation, consisting of Senator Edwards, H. G. Turner, engineer, of New York, and Angus MacLean, of Buffalo, recently visited Quebec and held a conference with the Hon. Jules Allard, Minister of Crown Lands, to ask permission to construct a dam on the Grand Cascapedia, in Bonaventure County. If this permission is obtained, it is the intention to erect a large saw mill, costing in the neighborhood of $2,000,000. It is estimated that the operation of a mill in this district would yield the Government a revenue of $150,000 from stumpage dues alone. The proposition is opposed by American fishermen, who claim that the salmon fishing along the water course would be destroyed. At the present time the Province receives $15,000 a year in fishing dues.

Montrealers Interested in B.C. Company

The Dominion Pacific Lumber Company, Limited, has been recently organized in Montreal, with an authorized capital of $3,500,000.

The company has been formed for the purpose of acquiring extensive properties at Port San Juan, near Victoria, B.C Their limits comprise 4,000 acres of Crown-granted land, on which there is over 165,000,000 feet of red and yellow cedar, white pine and silver fur, and 24,000 acres of land with special timber licenses, comprising 1,117,000,000 feet of the same class of timber as that growing on the Crown-granted land. They also own a logging outfit at Port San Juan, capable of handling over 120,000 feet of lumber per day, together with saw mill, booming grounds, and foreshore rights, and a mill site of 23 acres and foreshore rights in Esquimault Harbor. Both the Canadian Pacific and Canadian Northern Railways touch on their property.

Under the laws of the Province of British Columbia, the only logs exportable to the United States are those taken from Crown granted lands; therefore, the company has over 165 million feet on these lands capable of export. The price of logs is frequently from $2 to $5 per M. ft. in Seattle, Tacoma, and other Puget Sound ports more than in British Columbia, which largely enhances the value of this timber.

The 24,000 acres held under special timber licenses are subject to the new law making licenses perpetual instead of 21 years long, as previously. There is approximately on these limits, together with the Crown granted land, 1,285,000,000 feet of good Douglas fir, spruce, red and yellow cedar, white pine and hemlock.. This property has all been thoroughly cruised, the owners having employed from 40 to 55 men on the work from the latter part of January up to the middle of April. The head checking cruiser has reported that the logging facilities are particularly good. It is the intention, for the present, to handle this timber by logging it off and selling the logs in the open market. An annual cut of 50,000,000 feet, it is estimated, can be taken from the property.

Messrs. Johnston, McConnell and Allison, of Montreal, placed the stock on the market, and it has already been over-subscribed.

S. P. Musson Son & Company, Barbados, report under date of June 4 as follows: Lumberstuffs.—W Pine—The only arrival during the fortnight is the "B. B. Harkwick," with 179,672 ft., which had been sold to arrive at $30 for merchantable, and $22 50 for second quality. Demand is still good and we think another cargo should fetch in the neighbourhood of these prices. Spruce—The Schr. "Basile" arrived on the 3rd instant from Belliveau Cove, with 190m. ft. Spruce which we had sold to arrive at $25 for merchantable. She also brought 10m. ft. Hemlock which we have not yet sold. We have also sold another cargo of Spruce to arrive at the same price, but demand is good and we think present rates should be maintained Pitch Pine—No arrivals, but market is supplied at present. Shingles—Arrivals during the fortnight consist of the "Lilla B. Hirtle" from St. John, N.B., with 1,057,000 Cedar Laying of very good quality which had been purchased by one of our dealers at $2.25, and the "Maple Leaf" from Paspebiac to selves with 1,320,000 Long Gaspe, of which we sold the deck load consisting of 417,000 at $5.07, but have done nothing as yet with the remainder. Shooks—Receipts consist of 400 bdls. imported by a dealer. Wood Hoops—No arrivals and supplies are sufficient for present requirements.

Mutual Industrial Insurance in British Columbia

In view of the present widespread discussion of the subject of industrial insurance in the United States, much of interest can be learned from our neighbors in Canada, says the American Lumberman. The law of British Columbia is very stringent, and injured workingmen are certain to receive compensation. About six years ago the Mountain Lumber Manufacturers' Association instituted a scheme of mutual employers' liability insurance for protection in industrial accidents. Operators of saw mills, shingle mills, lath mills, planing mills, sash and door factories and other plants of like nature in eastern British Columbia may become subscribers to the accident fund. The object of the fund is to reimburse the subscribers, subject to certain exceptions and limitations, for all sums for which the subscribers become liable, either through common law or statute, to their workingmen because of personal injury or death resulting from accident in the operation of the subscribers' business.

In the event of an accident causing injury or death to an employee, the fund is liable to a maximum amount of $1,500, exclusive of certain costs, with the limitation that for any one accident which shall cause death or injury to several employees the total liability shall not exceed $10,000. It is the endeavor of the association to maintain the accident fund as nearly as possible at $25,000.

The fund is kept up through the levying of monthly assessments of three-fourths of one per cent. a month of the gross amount of the subscriber's pay roll, which includes board for the men to be calculated at the rate of 50 cents a day per man. The pay roll must cover all men in whatever capacity employed in or about the mills, logging camps, yards, drives, etc., but does not include office force unless they are specifically placed on the pay roll for insurance purposes. Each subscriber is required to furnish monthly to the special committee, which administers the fund, a true and full summary of his pay roll, and the special committee has the power through its own members or its agents to examine the books of the subscriber and inspect his plant.

The accident fund is available for payments for injury and death only. Provisions for free medical and hospital attendance for employees must be made by the subscribers individually through deductions from employees' wages or otherwise.

Every subscriber is required to keep all parts of his plant and equipment in proper repair, to provide suitable rules and instructions for their operation, to exert reasonable precautions to remove risk of injury, and in every way to use his best endeavors to enforce the observance of all proper safeguards and precautions by his agents and employees. The subscriber is especially required to comply with the laws of the Province in regard to factory operations and the employment of labor, and must keep on file with the special committee of the association certified copies of the British Columbia boiler inspector's report upon all the boilers in his plant.

The foregoing sketches only the more important points of the detailed agreement which is entered into between the manufacturers and the special committee of the association when the former desire to secure the benefits of mutual liability insurance. The details of the agreement are complete and provide a full working scheme of operation. The best test of the efficiency of this plan is the results obtained. The secretary of the association states that the accident fund was started six years ago without any capital whatever; that since then all accidents at the plants of the members of the association have been taken care of and there is to-day a very substantial surplus on hand. The scheme of protection is not devised for profit, simply for the purpose of giving insurance at the lowest possible rate to the members of the association; and it has worked out that this rate has been only one-half of the charges by regular insurance companies.

Fine New Mill for Vancouver Island

A branch of the E. & N. Railway will be constructed from Duncan, on Vancouver Island, to Cowichan Lake forthwith, and a three-quarter million dollar lumber mill will be built at tide-water, somewhere in the vicinity of Crofton, as soon as a site has been definitely selected. These two enterprises, which have been pending for some months and in the aggregate mean the investment of millions in the development of island resources, were definitely determined upon on June 16, when Mr. R. Marpole, vice-president of the railway, and Mr. W. E. Marsh, representative of the American Finance and Securities Company, held a final conference.

The concern for which Mr. Marsh has been acting is the purchaser of the tract of over 50,000 acres of timber lands about Cowichan Lake. One of the conditions of the sale was that, when the new owners were ready to begin the active exploitations of their holdings, the railway should construct a twenty-five mile spur, thus furnishing an outlet from the logging camps to salt water.

"We hope to get started in the spring," said Mr. Marsh. "Of course I can't say, definitely, that we will be ready then. The railway can't be constructed in a month. But we mean business.

THE WOODWORKER

Loss of Lumber in the Woodworking Industry—How to Reduce the Waste

The necessity for reducing waste in the woodworking industries was the subject of an interesting address by Mr. Wm. L. Hall, Assistant Forester of the U. S. Forest Service, delivered at the recent annual meeting of the National Slack Cooperage Stock Manufacturers' Association. Mr. Hall said in part:

Let us consider what our approximate consumption and waste is in turning the trees into manufactured products. The wood which we cut down in the forest each year, if compacted together, would make a solid cube one-half mile square. It is taken out by many industries. The lumber industry takes 42 per cent.; cordwood, 32 per cent.; fence posts, 9 per cent.; sawn railroad ties, 7 per cent.; cooperage stock, 2 per cent., and pulpwood, 2 per cent.; shingles, round mine timbers, distillation, veneer, poles and minor requirements take the remaining 6 per cent.

In manufacturing sawn lumber and its use by the industries 67 per cent. of the wood which grows in the tree is lost. In cordwood the loss is as low as 5 per cent., but in posts and rails it amounts to 20 per cent. In hewed railroad ties the waste runs to 70 per cent. and in cooperage stock the figures which the government has been able to collect indicate that the waste amounts to approximately 78 per cent.

I introduce these figures to emphasize the opportunity which exists for a better adjustment between the industries which use wood as a raw material than now prevails. We use wood in many forms, some large, others very small. Yet for even the very small products it is customary to take the entire tree and saw it into logs and then by various steps of cutting down to convert the log into the desired product. With an unlimited wood supply this is perhaps the easiest way, but it necessarily results in the enormous waste which has been pointed out.

A better and more economical utilization of the wood supply would result if the industries were so organized that those which require small pieces for their finished product could employ at least in part the waste from the industries which use larger pieces. As an example let us consider the conditions which favor a close interdependence between slack cooperage and lumber manufacture. Perhaps we shall be surprised to see how similar the alignment is between the two.

First, we may note that both are distributed through a large number of states and mainly through the same states. Thirty-five states reported the manufacture of slack cooperage stock in 1908. The same states with a few others make up the bulk of the lumber production.

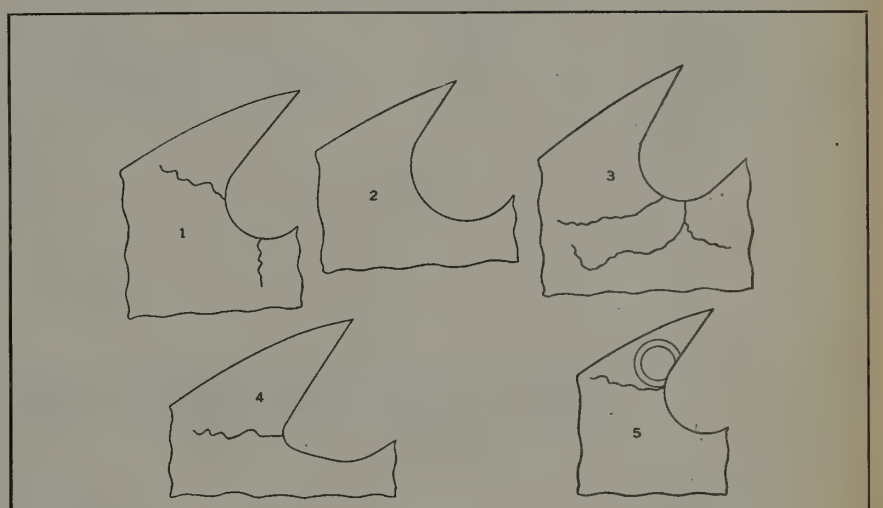
Second, it is to be seen that both industries employ a large variety of woods. Lumbermen are now cutting practically all the woods which occur in commercial quantity, and the slack cooperage manufacturers reported the use of nineteen woods in 1908 and much more than that if we divide up such woods as oak and pine into the various species. While hardwoods are most extensively used, pine, hemlock, spruce and tamarack are all employed and more pine is used for heading than any other wood.

Make Staves from Waste

Third, slack cooperage turns out all its product in short lengths and could use exactly the kind of material that is wasted by thousands of feet at most of the large sawmills. Some of the material that goes to the burner and much more that is fed to the boilers would be excellent slack cooperage material. It is sound stuff, one or two inches thick, of varying width and in lengths from two to eight feet. Of course it has not been as convenient to use such material as it has to saw the required sizes out of the log, but now that stumpage is constantly going higher, it means that manufacturers must look to economy in securing raw material and it will be a great deal cheaper to buy mill waste in the form of sound, short pieces than to buy logs.

Fourth, slack cooperage employs a large proportion of relatively low grade material. In studying the raw material used by the wood consuming industries of Massachusetts for 1908 we found that the material purchased for slack cooperage was obtained at a lower average price than the material for any other industry. The average price was $14.06 per 1,000, as against $16.02 for box material. In addition to actual waste the sawmills always have much low grade lumber for which they have difficulty in finding a market. This material could, with great advantage to the lumber market, go to the cooperage trade.

These conditions appear to emphasize strongly the advantages of a closer relationship between the lumbering and slack cooperage industries. A movement is in fact setting in in this direction. The census report for 1908 says: "An interesting fact disclosed by the statistics of the last few years is the increasing number of establishments which turn out staves and heading as by-products in the manufacture of lumber."



The waste in lumber manufacture will prove a mine of wealth to that industry which can so adjust itself as to take advantage of it. Distillation men, pulp men and cooperage men are all making advances upon it and it remains to be seen which of the three will obtain the larger part.

While considering the possibility of using sawmill waste as raw material for cooperage stock it should be remembered that the cooperage industry has also a very large waste to which attention should be given. I can see no reason why the waste from this industry might not be worked up almost completely into small products, such as clothespins, meat skewers, handles, brushes and toys, all of which are made from the same woods as are used in cooperage.

This discussion logically leads to another point which I desire to make emphatic, because I believe it to be of much importance. I refer to the necessity among the men of the cooperage industry, as of all other wood-using industries, for the adoption of an investigative attitude toward advances and improvements in their practice. The time is past when any industry can blindly follow old customs and continue successful. The fever of research and experiment is on. Methods and equipment are changing almost constantly to the end of saving raw material, cheapening processes or improving the product. It is important that cooperage men should adopt this attitude. Let every process be subjected to the most careful study to see if it is the best that can be evolved. That the problems of raw material and waste deserve most careful consideration I am sure none will deny. They perhaps, more than other factors gauge the success of any manufacturing business.

Circular Teeth

It is as essential to have a good tooth on a circular as on a band. Some years ago a Pennsylvania mill had trouble with losing teeth and broken rims in frosty timber, says J. H. Miner, in the Woodworker.

Types of Circular Log Saw Craeks

The saws were 64-in., eighty teeth, and ran 800, good power. Style 1 was the tooth sent out on the saws. Several saws were replaced, and different men from the shop sent there to correct the evil. In summer, or when there was no frost in the timber, all went well. The filer wrote me (strange to write a southern man, who had never sawed a solid frozen log). I suggested a tooth like 2—shorter, with a curved front, beginning ½-in. from the point, and with a larger, rounder throat. There was no more trouble. Since then I recommend this tooth on all circulars. If it gives relief in front, why not under other conditions?

Recently it was again called to attention—saws cracking in the rim and teeth breaking out like 3. This was in southern pine, and in some of the best mills. Now there are readers of The Woodworker who have seen or had this trouble. Will they please give the cause? Two mills in particular have called my attention to these cracks. I gave my opinion, but am not yet prepared to say if my remedy works. There was nothing wrong with the teeth, and the two mills in particular are cutting 75,000-ft. per day of good yellow pine lumber.

Another frequent cause of broken teeth is shown at 4. There are plenty of filers running a tooth like this and having no trouble, but it is

because the feed is not put to them. More than once has my attention been called to saws being defective, and once was I summoned to testify that the fault was in the saw; but I did not testify.

We put out a pair of 9-gauge saws like 5, eighty teeth, 850 speed, unlimited power. We later got complaint of teeth breaking as shown. No cause was assigned. The mill was using other makes of saws and having no trouble. It was up to me to locate the trouble. I went down, found teeth broken as stated, also found saws of other makes with teeth out, but not so many. I located the trouble instantly. They were using the under or eccentric swage, and the grip being sharp, made a small cut or indentation where the crack started. I took a swage-bar, using it as a wedge, and broke several teeth out of the saw. This settled the matter, as all showed a fracture. The sound teeth would not break. I recommended a top swage. They got it, and their trouble ended. Later the manager apologized. I was much interested in the washboard problem. Too long a tooth, regardless of shape, will do this in either circular or band. My experience has been that when the heaviest feed is carried, circulars will not washboard, and yet they do so at moderate feed. The worst I have ever seen was recently from a band saw. I can't imagine how a 14-gauge saw made such furrows.

Will the readers of this journal tell the cause of the peculiar breaks in 3? Why will a saw making good lumber and lots of it, no washboards, a perfect tooth and swage, material and temper the best that can be had, crack so? Note the irregularity of the cracks; some cracks would start in bottom of throats and circle back and take the tooth out. They would not go over 2" deep, then spread out as shown.

Sash Making Suggestions for Small Mills

The small planing mill is called upon almost every day of the spring and summer to manufacture a few sash, and unless the sash man is a resourceful mechanic, the cost is apt to be excessive, says a writer in The Woodworker. Accuracy and speed are most desirable in the man that lays off sash in the small planing mill. By this I do not mean that these same commendable traits are not insisted upon in the larger mills, but that they are less likely to be sharply defined in the lay-off man of the small mill, owing to the lack of sufficient opportunity for practical experience.

The larger mills have the advantage of having more opportunities to rework, to advantage, any sash material that may have been laid off wrong by the sash and door man, and the error is therefore less likely to result so disastrously; they also have the great advantage of manufacturing sash in larger quantities and can consequently employ cheaper assistance in the sash and door department. It therefore behooves the small job shop to adopt any reasonable plan that will insure accuracy and increase the amount of work done by the lay-off man. With this end in view, I would suggest the adoption of certain

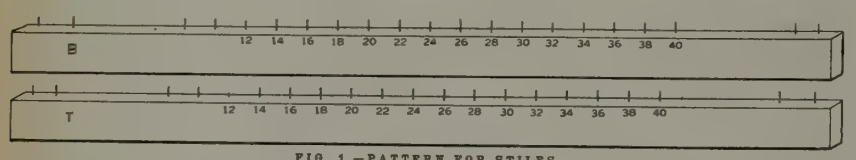


FIG 1 —PATTERN FOR STILES

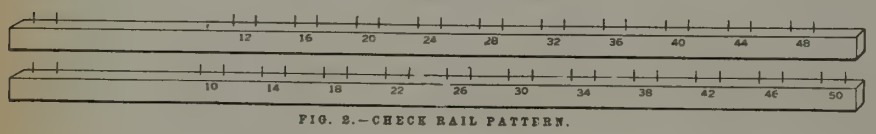

FIG. 2.—CHECK RAIL PATTERN.

patterns and rules of work, which may be elaborated upon to suit certain conditions.

As checkrail sash are made different ways, I shall in this article consider but one way—that of mortising the checkrails, tenoning end of stiles, and of using 1⅜-in. dressed material for checks.

The first thing to consider is the lay-off bench. The stop thereon, for squaring the sash material against, should be about 1½-in. thick, and undercut so that only ¼-in. of top edge strikes end of stiles· this strikes the ends in about the centre, so in case they are not cut square, it makes no variation in glass size when tenoned to the stop on machine. Of course, the stop on tenoner must strike the stiles in about the same place, otherwise a variation in glass would appear.

The next thing is the pattern for laying off the top and bottom stiles, same pattern for both, by reversing, or turning end for end. The pattern consists of two pieces just alike, ⅝ x 2⅝-in. x 1-ft. 6-in. From one end of pieces lay off the mortise for bottom stiles, and from other end lay off mortise for top stiles, being careful that the space between these mortises is such that the intermediate spacings from these mortises will coincide, so that one set of pins will suffice for the lay-off of either top or bottom stiles; this is important. Then drive in the pins, leaving about ⅜-in. stick out to engage the straightedge. Fig. 1 illustrates the spacings of pins.

The application of the pattern is simplicity itself. One piece is placed on either side of a number of stiles to be laid off, which are squared against the stop on lay-off bench, then a small straightedge engages the proper pins, to lay off for mortise and tenon. Of course, but one piece is all that is necessary to lay off for tenon, as the balance are tenoned to the stop on tenoner; indeed, the mortiser may be set with stops so that but one piece need be laid off for mortiser if the number of pieces justify it.

The sketch of the two-piece pattern shows how the sides are marked; when laying off top stiles, use the T sides of pattern; when laying off bottom stiles, use the B sides, by turning pattern end about. Of course, the mortised end of stiles is the one to work from, as it must engage both bench and machine stops. This allows all variation in length to appear where it does no damage. This pattern is good for any stiles having even-size glass from 12-in. to 40-in.; greater range can be had by adding more pins; other patterns can be made for laying off transome, barn sash, eight and twelve-light windows, etc. The idea is here conveyed and but remains to be developed to suit the requirements of individual mills.

The patterns for the checkrails are composed of four pieces—⅝ x 1⅜-in. x 4-ft. 8-in. On two of the pieces mark on one edge with a knife point the mortises required for the following checkrails: For glass sizes, 12-in., 16-in., 20-in., 24-in., 28-in., 32-in., 40-in., 44-in., 48-in. On the other two pieces mark for glass sizes, 10-in., 14-in., 18-in., 22-in., 26-in., 30-in., 34-in., 38-in., 42-in., 46-in., 50-in. Then in the centre of the knife-marks drive small pins or nails. leaving about ⅜ in. of the pins exposed, to engage the straightedge which will be required, and which may be about ⅜ x 1-in. x 2-ft.

With the straightedge and the two pairs of patterns completed, we can now lay off any checkrail for any two-light window having even-size glass from 10-in. to 50-in. wide, without the use of either rule or square, which is an excellent point to consider, as it requires time to measure accurately for sash, to say nothing of the uncertainty which is ever present when using a square on wide surfaces.

The straightedge must always be used on the opposite side of the pins from bench stop; this enables the lay-off man to exert pressure against pins, which holds the pattern firmly against bench stop.

To lay off 30-in. checkrails I use the two pieces having the 30-in. size, laying one on either side of a number of pieces to be marked, and by the straightedge engaging the proper pins on the patters I am enabled to accurately and speedily lay off twelve or fourteen checkrails with four strokes of the pencil and four movements of the straightedge; then, by the use of the attachment for mortiser referred to in a preceding article, I mortise through from the marked side of checkrail, then stick the checks bottom side up. and the sticker removes the little tearing the mortising chisel does in going through. Of course, this explanation is only for those mills that are mortising the checkrails.

These patterns should be stamped with the proper figures at each mortise, that the lay-off man may see very plainly the size he is using. I have noticed some lay-off men mark both the face side and working edge of the stiles. That is unnecessary, and, of course, takes longer. All that is necessary is to make a cross-mark on the joint of each pair of stiles as they la yon the bench, for marking mortise, that will indicate face and working edge to the mortiser, tenoner and sticker, and it is done in about one-fourth the time.

As so few mistakes are made in laying off rails for two-light windows, I believe patterns for them are not an absolute necessity, yet they can be worked to advantage by any one caring to make them; rail patterns for four-light, twelve-light and sixteen-light windows are here recommended.

Another suggestion to the lay-off man: Don't waste time by marking face side of rails for two-light windows. The man that does the tenoning can "grain" the rails as he runs them, without any loss of time; and, of course, the sticker man knows the face side by the cope, which makes the marking unnecessary.

In assembling two and four-light windows, it can be done to best advantage by leaving off checkrail until after sanding through the drum sander on "lip" side, then check may be put on and sash sanded on level side. This robs the elbow sander of a considerable amount of questionable glory, and when the job is done it is done both well and speedily.

By the foregoing we see how time is saved by the use of patterns, by mortising clear through with one operation, by not marking for face on rails, and by doing the sanding on drum sander; therefore, odd sash may be made in satisfactory time, without a chain-saw mortiser, double-end tenoner or lock-joint checkrail.

A few more suggestions could be added, such as the plowing, boring, relishing, up-keep of machines, etc., but those things are best fought out in turn in each individual mill, yet suggestions will be forthcoming upon inquiry.

The British Columbia timber license returns for May show that 753 licenses were issued for lands west of the Cascades, producing a revenue of $105,198.75; east of the Cascades, 355 licenses were issued, netting $40,956; transfer fees amounted to $285; penalties were $1,725; coal licenses (50), $5,000; and miscellaneous receipts $5—a total for the month of $153,469.75.

CHISEL TOOTH
TRADE MARK
SAW
TORONTO

Extract from Letter received from Eastern Canada

GENTLEMEN :—

We received your No. 2½ Chisel Tooth Saw and have tested it very thoroughly and are pleased to write that it is the most perfect saw we have ever had. The tension is the finest. It is the only saw we have ever had to stand up and do good work with the heavy feed we carry.

We are sending you saws of another make and would ask you to hammer them the same as the one you sent us.

When we need new Saws, you get the order.

This was a Burns No. 2½ Chisel Tooth Saw giving satisfaction under very heavy feed

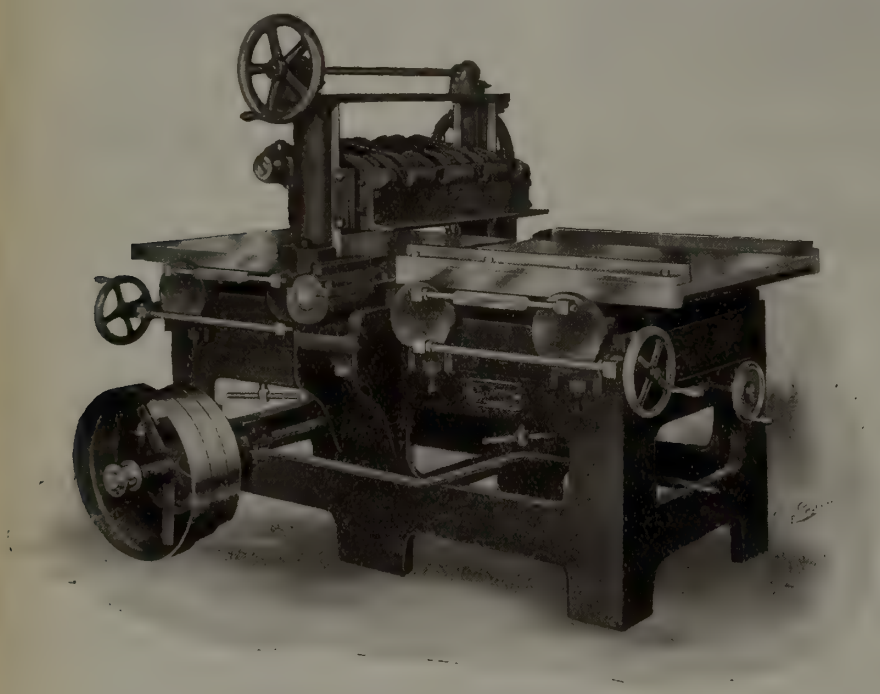
Machinery and Equipment



What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

An Important Woodworking Machine

The Falls Patent Undercut Face Planer, which is illustrated herewith, is one of the most important machines introduced to woodworkers in many years, and seems likely to become an important part of the equipment of every woodworking establishment. It is capable of effecting economies in the facing department similar to those of a power feed rip saw in the ripping room. For all kinds of facing, taking stock out of wind, etc., it does the work of three or four hand planers operated by as many men. It will straighten perfectly material any width up to the full capacity of the machine and any length from 6 inches up, at a rate of three or four times that of the ordinary buzz planer. This increase in output is not secured at the expense of quality, for, as the rate of feed and the pressure exerted on the material are absolutely uniform, there is a slight improvement over hand work.

Besides its great capacity, it has the further advantage of being safe. The manufacturers claim that no accidents are possible on it, as the operator may be ever so careless, yet his fingers cannot come in contact with the safe-guarded knives.

The Falls Facer is of much value on all classes of manufactured goods that require straight surfaces and wherever the hand planer

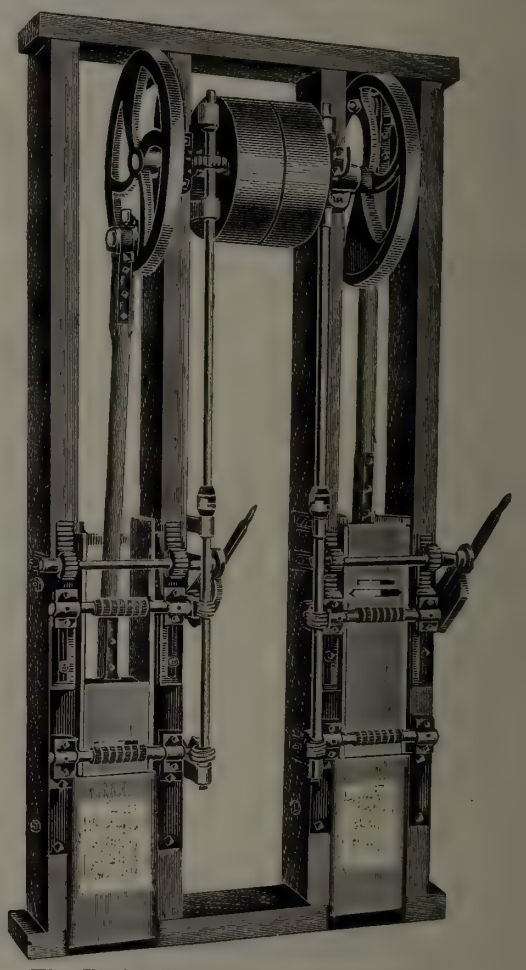
The Falls Patent Undercut Face Planer.

is used for facing. All manufactured woodwork, especially that made of hardwood, should be faced before planing. With the great capacity of this machine and the consequent low cost of facing, it should pay to face everything that is worked, for the results in the finished goods will more than justify the slight expense. A great deal of crooked stock which formerly could not be profitably straightened and was, therefore, food only for the burners, can, with an Undercut Planer, be worked up at a good profit.

The following brief explanation of how this machine accomplishes what has always, heretofore, been considered the impossible—taking stock out of wind on an automatic feeding machine—may be of interest to our readers:

In commencing to feed the machine, the operator has the board under control the same as if he were going to feed it over a hand planer. He holds it in the proper position to divide the cut to best advantage to preserve the thickness, and feeds it forward till the cut is started, after which the rollers grip it and draw it forward. This gives a straight face on the end of the board, and once a flat surface is started the board can be pressed down on the back table without affecting its position on the front table, so that only that part which is below the line of cut will be removed by the knives. This is the exact method of hand feeding, only more positive, regular and rapid.

It is owing to the peculiar construction of the rollers that they get a grip on the board sufficient to carry it forward, without exerting enough pressure to spring it down even where the board is so crooked that the cut is not carried all the way. They rise and fall with its irregularities and conform to the crooks in the stock, but do not in any way increase the pressure in rising, as is usually the case in roller feeding machines.



Both the design and construction of this machine have been fully protected by patents, and Messrs. John Ballantine & Co., Limited, of Preston, Ontario, have secured the sole rights to sell and manufacture it in Canada.

Although it has been on the market only a few months, quite a number of the most progressive firms have installed it, and the manufacturers now have on hand orders for as many machines as they can build in the next two months, while the number of inquiries is constantly increasing.

This machine is well worthy of investigation, and a postal card to the manufacturers will bring full particulars.

Elmira Excelsior Cutting Machines

The Excelsior Cutting Machines, manufactured by the Elmira Machinery and Transmission Co., Ltd., Elmira, Ont., one of which is

The Elmira Excelsior Cutting Machine.

illustrated herewith, are of considerable interest to any who desire to produce excelsior.

The frame of these machines is made of well-seasoned maple, and all the shaftings of steel, connecting rod boxes of brass with good oil cups. The feed rollers are made of steel, well corrugated. The pulleys are 18 inches diameter, 6 inch face. The balance wheel is extra heavy, being 28 inches in diameter and counterbalanced to give steady motion. The plane or cutter head, which holds the spur box and knife, is connected to the fly-wheel by a pitman.

The block of wood is held between two corrugated steel rollers; the lower roller rests in two stationary boxes bolted on frame. The top feed roll works in boxes on sliding frame, which moves up and down face of column to suit different lengths of wood. This frame is moved by a lever and two small spur wheels working in rack on sliding frame. The lever and spur wheels are fastened to a shaft which turns in two boxes. By lowering the handle the sliding frame is raised for placing blocks in position. A heavy weight is attached to opposite end of lever so as to form pressure on the block while it is fed in toward the knife. The feed motion is produced by a worm wheel attached to main drive shaft which works in a worm gear on upright shaft. On this upright shaft there are two worm gears, one right and one left, which work into worm gears on feed roll, thus making a positive motion feeding forward about 1-90 inch at every stroke of the knife.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

THREE HUNDRED THOUSAND FEET 1½ and 2" log run hard maple dry or new. State best cash price on cars. Box 102 CANADA LUMBERMAN, Toronto, Ont. 15

Lath Wanted

WANTED 3/8 x 1½—4' Lath. 10 cars No. 1, 20 cars No. 2, and 10 cars No. 3, either rail or water shipment. ALLEGHENY LUMBER CO., Pittsburg, Penn. 13

White Pine and Hemlock Lath

WE WISH TO BUY THE ABOVE IN CAR lots. Address, THE McDONALD LUMBER CO., Pittsburg, Pa. 15

WANTED—A QUANTITY OF ROCK ELM, Birch White or yellow preferred, and Maple, 3" plank, for bending purposes. Quote prices on carload lots to N. M.CURRIE, Box 304, St. Marys, Ont. 13

Wanted at Once

ABOUT 100,000 FEET 2-INCH BIRCH OR maple lumber, must be dry; to measure 12 feet long and from 7 to 12 inches wide. The ALASKA FEATHER & DOWN COMPANY, Limited, 400-432 St. Ambroise Street, Montreal. 14

Wanted Red or White Oak

FOR PRESENT OR FUTURE DELIVERY in the following sizes: 1", 1¼", 2", 3" and 4" 5x7, 5x8 and 6x9" Squares with hearts boxed. Apply Box 986 CANADA LUMBERMAN, Toronto, Ont. t.f

Birch, Basswood, Oak and Ash

WE DESIRE TO PURCHASE AT ONCE good Birch, Basswood, Oak and Ash lumber, all sizes. Write us and tell us what you have. BARTRAM BROS, Limited, Citizens Building, Ottawa, Ont. 14

Wanted Soft Elm, Birch and Spruce

Soft Elm, Good 1½ x 6" and up
Birch, 4 x 4, 5 x 5, 6 x 6, 1¼" 1½" 2" 3" and 4"
Spruce, Clear 2 x 4" and up

Box 982 CANADA LUMBERMAN, Toronto, Ont. tf

Wanted White Pine Pump Squares

Must be Quarter Cut

7"x7", 6"x6" AND 5"x5". HIGHEST MARKET prices paid, also 2" and 3" Tank Lumber. ONTARIO WIND ENGINE AND PUMP CO., Toronto tf

Wanted

Birch, Basswood, Ash, Elm and Maple

WE REQUIRE THREE MILLION FEET 1" to 4", shipment when dry, can use LOG RUN DEAD CULLS OUT. Inspection at mill. Box 919, CANADA LUMBERMAN, Toronto. tf

Wanted Hard Maple and Soft Elm

WANTED FOR IMMEDIATE SHIPMENT, two cars 2" and 3" Hard Maple Plank; also for shipment any time during 1910, up to fifty cars Soft Elm, 1" x 12" and up wide x 6½' :7' 8' 13' 14' and 16' long. Address ROBERT BURY & CO., Lock Box 408, Teeswater, Ontario. tf

Squares Wanted

HARD MAPLE, BEECH, OR BIRCH 1-1/8 x 1-1/8 x 42 and 1 x 1 x 50 and 1¼ x 1¼ x 50—Basswood 1¼ x 1¼ x 50. Parties who can supply any of these sizes will please send for complete specifications We can give you sufficient number of sizes to work up all your slabs, edgings, etc. Box 104, CANADA LUMBERMAN, Toronto, Ont. 16

WANTED—A FIRST CLASS HARDWOOD lumber salesman and buyer to handle both Canadian and Southern Hardwoods. Must have experience and a good connection with Toronto and Western Ontario Manufacturers, also to be familiar with grades and values. Good salary to right man. State age, experience and salary wanted. THE WILSON LUMBER CO. LIMITED, Toronto, Ont. t.f

BUSINESS OPPORTUNITIES

Planing Mill and Lumber Yard

A GOING CONCERN DOING GOOD BUSI- ness, good reasons. B. J. MCCORMICK, Welland, Ont. 13

For Sale

FOR SALE. BOX FACTORY AND SMALL farm, factory is equipped with machinery for making butter boxes also with shingle and lath machinery, located in good timber section and doing good business, steam power, farm of 15 acres, good state of cultivation, good buildings, running water, located on C. P. R., cheap to immediate purchaser. Good opening for sash and door factory or clapboard mill. Apply to W. L. FISH & SON. Johnville, Que. 13

For Sale

1400 ACRES OF TIMBER CONSISTING of Hemlock, Elm, Birch, Ash. Spruce, Basswood, Cedar, Etc. 60 per cent. good Hemlock. A new saw mill at the railroad. For particulars apply Box 531, ORILLIA, ONT. 13

Timber Limit and Saw Mill For Sale

WE OFFER OUR TIMBER LIMIT AND saw mill for sale together with machinery tools camps and camp equipment, about five thousand logs located 35 miles from Ottawa, This is a good opportunity for lumbering. LOW LUMBER CO., Low, P.Q. 13

For Sale—Planing Mill and Lumber Yard

HAS AN EXCELLENT BUSINESS, CON- tracts on hand to be finished and requisite lumber in yard. Apply Box 1436, GUELPH. 14

Planing Mill For Sale

IN THE THRIVING TOWN OF ORILLIA, a convenient, modern planing mill, complete with drying kiln plant, and equipped with the best American machinery. G. T. R. sidings running through both ends of mill The C. P. R. and Canadian Northern Railroads are now being built through the mill yard within 60 feet of the mill. Reasons for selling, owner giving all time to distant lumbering interests. Apply to P. O. Box 716, Orillia. 14

MISCELLANEOUS

For Sale—Timber Limit

BERTH 3, TOWNSHIP OF GUARD, PARRY Sound District, containing hemlock, birch (black) maple, red oak, basswood, spruce, and cedar. Apply Box 1456, Cuelph. 14

A Pulpwood Klondyke

THE PICK OF THE FINEST VIRGIN timber lands in Labrador and Newfoundland. Advantages on Labrador over other territories: no cutting tax, no royalty, no export duty, pulp making and lumbering free of restriction, limitless water powers. We control valuable timber properties on Labrador and Newfoundland, and are prepared to give prospective purchasers all information regarding same. For further particulars apply to JOB BROTHERS & CO., LIMITED, St. John's, N. F. 23

Timber Limits For Sale

NINE SQUARE MILES ON CHERRY Creek and North Fork of Spallumcheen river Osogoos division, Yale district, British Columbia, about 50 miles East of Vernon and 20 miles west of Upper Arrow Lake.

These limits are comprised of bottom lands and benches of hills and contain about 100 million feet of the finest of Cedar, with a fair proportion of Hemlock, White Pine and Fir and are very conveniently situated for logging, with easy slopes toward streams. This is one of the most desirable properties in the Yale district and is steadily increasing in value. For further information address, BEATY TIMBER COMPANY, 4 Wellington St., East, Toronto. 14

A leading centre for rock elm is Cadillac, Mich. Dealers buy the trees only, at so much a cubic foot. They hire gangs who are specialists in this line of work, who travel from one section to another as fast as the rock elm and white pine have been converted into square timber. This timber is all exported and is used in constructing ships. Rock elm is the strongest timber for shipbuilding that grows, a 4 by 4 being equal to a 5 by 5 oak. Rock elm is very scarce, growing only in central Michigan and in Wisconsin. This timber brings a high price, and as the waste is comparatively small, it is one of the most valuable timbers growing in Michigan.

Red Cekar Growing Scarce

Red cedar, which is the mainstay of the pencil manufacturers, is giving out, and, according to the United States forest service, a desperate effort is being made by the pencil manufacturers of the country to find a satisfactory substitute. To this end the forest service has been called on and samples of a large variety of woods are to be tested by the pencil makers to see if there is not something that will take the place of red cedar, the supply of which will be totally exhausted within five years.

It is a fact that the makers of pencils have never found anything to take the place of red cedar. It is the material of which pencils have been made since there were pencils.

There are 325,000,000 pencils made in the United States yearly, and the supply of wood is a serious problem. Red cedar has been going up in price as the supply has diminished, and two years ago the Department of Agriculture called attention to the situation.

It was explained then that the pencil manufacturers were buying up the old cedar fences in New England and making them into pencils. These fences were built in a day when red cedar was more plentiful than it is now, and when pencils were not such a large product. The pencil makers were glad to replace the old fences with wire and pay for the wood in addition.

The need now is for a wood that is neither spongy nor unduly hard, that is free from knots and that is sufficiently plentiful for the needs of the trade.

Among the woods to be tried are Rocky Mountain red cedar, alligator juniper, western juniper, redwood, incense wood and Alaska cypress. Wood specimens collected from the forests will be sent to four leading manufacturers who have agreed to make pencils of them. The manufacturers will keep a record of the tests and report to the forest service the results, as well as their judgment as to the fitness of the individual woods.

The Use of Hickory in United States

The United States Department of Agriculture, in co-operation with the National Hickory Association, has recently completed a canvass of the chief users of hickory in that country to ascertain the annual consumption of this wood.

The rapidly decreasing supply in recent years has caused no little alarm among the manufacturers of products requiring hickory; however, it has been impossible up to the present to get statistics which could be considered authentic, either as to the yearly consumption or the total remaining stand of this wood. This can be attributed partly to the large number of small mills, which after cutting all the hickory within a reasonable distance, are either sold or moved to new localities. The large amount split into billets for spokes, handles, etc., instead of being sawed into lumber, is also the cause of considerable trouble among the census takers.

While it is not claimed by the department that the figures recently compiled are complete, they at least give an indication of the prevailing conditions. All lines of manufacture requiring a strong, tough material are regular and large users of hickory stock. Under this heading can be quoted the manufacturers of vehicles of all sorts, and of handles and similar articles. The figures compiled by the department state that the estimated amount of hickory used by these establishments in the manufacture of their special products is annually about 131,600,000 board feet.

In addition there are about 200,000,000 feet sawed into hickory lumber each year, and it can be said that most of this stock is remanufactured. The total amount, therefore, consumed annually in the United States is about 330,000,000 board feet. According to the Census Bureau reports, hickory lumber sells at an average figure, at the mills, of $30 per thousand, while selected stock, used in the special industries, is worth a minimum of $50 a thousand. The hickory industry, therefore, is annually productive of about $12,000,000.

While hickory is one of the most useful woods of the North American forests, it constitutes only from two to five per cent. of the total stand. As was the case with various other hardwoods of quality, the favorite source of production, and the locality in which the best and most abundant stock was found, was formerly Indiana and Ohio. The supply in these states, however, has been very materially reduced, so that, while the tree is found generally throughout the Eastern hardwood forests, the state of Arkansas at present furnishes by far the largest yearly shipments of hickory. Next in order of importance can be named Tennessee, Indiana, Kentucky and Ohio.

Dry Rot in Timber

As a destroyer of timber used in the construction of dweling houses, the fungus popularly known as "dry rot" has been well known for many years. Notwithstanding modern improvemnts in ventilation, etc., the disease appears to be gradually gaining round.

Infection with the dry rot fungus sometimes takes place in the forest, when felled timber remains stored there for some time. The first evidence of such infection is indicated by the presence of red stripes in the sawn wood. If such wood be thoroughly seasoned the mycelium present in the red stripes is killed.

On the other hand, the fungus is by no means rare on old beams and boards stored in woodyards, etc., and it is mainly from such sources that spores, or portions of the spreading mycelium, are introduced into buildings by new wood which has become infected.

During the building of a house the danger arising from the presence of dry rot may be reduced to a minimum by taking proper precautions. A thorough system of ventilation and the avoidance of damp, stuffy places is of primary importance.

Perhaps the greatest source of danger arises where the ends of joists are built into a wall near the basement of a house, and this is more especially true where there is evidence of red stripe in the wood. As a precaution, the ends of joists should always be treated with creosote. A frequent cause of trouble is the use of damp deadening material, or "pugging," and covering it over with boards before all the moisture has evaporated. Such material should be used as dry as possible, coarse sand being the best for the purpose.

The spreading mycelium of the dry rot fungus can be checked by the application of carbolic acid, and when its presence is once detected all woodwork that can be reached should be thoroughly saturated with the same substance.

Woods Used in Car Building

While all-steel cars, both for railroads and street car service, are constantly coming into more general use, the older style of wood and steel cars are still vastly in the majority.

Cars of this type embody 90 per cent. of wood in their construction. The heavy framework, underbody, etc., is of pitch pine, side sills being reinforced with heavy steel plates. The centre sills are frequently I beams, either with or without wooden fillers, the general framing timber usually being steel, reinforced. Wide poplar stock has an extensive demand for sheathing, panels, signboards, roofing, etc., though the general interior finish is of a variety of materials. White ash in natural color, cherry, oak and mahogany are favored in the order named.

In headlining, different stock is utilized, and when expensive woods are used they usually are in threeply veneer. Maple and oak are extensively employed in this connection. Thin steel casing and various patent wood pulp facings are used to a limted extent.

French Walnut

The so-called French walnut, a tree which really grows in Persia and Asia Minor, is considered the finest and most costly of all woods. In appearance it is warped and much contorted, and the sole value lies in the large, tough excrescences growing on the trunk in the form of burls. These burls, when cut, present a singularly complicated and twisting grain, the intricacy of which, together with the symmetry, is the determining element in fixing values. Color and soundness also enter into the question to a large extent, as trees of this sort are more than liable to be unsound at the heart. A figure of from £100 to £200 is not exceptional for a good burl, and one recently sold in Paris, weighing 2,200 lbs., for £1,000.

The Output of Oak

The cut of oak in the United States in 1908 was but little more than three-fifths as much as in 1900, and it is probable that the total cut of oak lumber will never again be as great as it was in that year. The supply of oak in the Northern States has been largely cut out, and now the Southern States are being heavily drawn upon. In 1900 Indiana ranked first in oak production, with 649,794,000 feet, or nearly four times as much as in 1908, and in the same year Ohio was second, with 596,618,000 feet, or nearly three times as much as in 1908.

Review of Current Trade Conditions

Ontario

Trade conditions throughout Ontario are not quite so satisfactory as might be desired, especially in regard to hemlock. The recent advances in the price of hemlock appear to have worked against orders so far as manufacturers are concerned. Wholesalers, however, who have extensive stocks, report a good trade. There is a normal amount of trade, and conditions are expected to adjust themselves to the new prices before long. The only danger is that some of the manufacturers may need to sacrifice hemlock stocks to provide room for pine.

Pine conditions are good. Prices show no change, but the demand is good in all intermediate and better grades. Mill and dead culls are still stagnant. In the United States markets, particularly at Buffalo and Tonawanda, there is a fair amount of trade in progress. Crop indications are good, and are encouraging a feeling of optimism. Laths continue strong, and shingles are enjoying a good demand.

There is a steady volume of lumber shipments going on from the Ottawa Valley, but business is not by any means brisk. Birch has been selling more actively than any other line, and good pine sidings are also in strong demand. Sound white pine box and assorted spruce are also selling well. As high as $55 has been obtained by one dealer for 1" x 8" and up, good pine sidings. It is expected that 1", 1¼" and 1½" will continue at firm prices. 1" x 7" and up have advanced between one and two dollars per thousand. Pine box boards are selling well in the 12 to 16 feet lengths. Dry birch is rather scarce. Log run is firm at $20. Ash is selling rather well at $29 per M. log run. Shipping and mill culls are easier. In the Ottawa markets spruce and hemlock are being substituted for pine shipping and mill culls. Low grade pine, in fact, is still a drug on the market, and promises to remain so for some time. Lath, shingles and railway ties are easier. Lath and shingles declined from 10c. to 15c. for the grades which are in largest supply. Tie manufacturers, however, are maintaining their prices and hoping for a better market. Telegraph poles continue scarce.

Eastern Canada

A rather more promising situation is developing in the Maritime Provinces in connection with export business. The trade with the United States, however, is not so satisfactory as would be desired. Those who depend upon the English markets for their demand are doing much better than those who ship to the United States. Shipments of long lumber to Boston and New York are rather quiet, on account of the frequent pessimistic reports relating to United States trade and politics. United States buyers are, for the most part, contenting themselves with hand-to-mouth orders. It is expected, however, that before long buyers will commence to lay in stock for the fall, and an improvement is looked for in this direction. Merchantable 1-inch undressed spruce boards (dutiable) are quoted at $14 to $14.50 per M. at Miramichi. Spruce random for the Boston markets is fairly firm, being quoted at $17.50 to $18.00 for non-dutiable 2-inch, f.o.b. schooner St. John. Cedar shingles are unchanged. The production has been light so far this season. The trade in high-grade shingles is quiet. Prices are steady at about $2.65 for dutiable extras and $2.15 for dutiable clears at St. John. Miramichi figures are $2.40 and $1.90 for extras and clears. Quite a number of shipments of shingles are being made to the West Indies from New Brunswick. This trade is steadily growing. It takes a low-grade shingle, such as No. 1's, which sell at $1, and extra No. 1's, which sell at $1.35.

The New York yards continue to purchase Eastern spruce for immediate purposes only. There is no buying for future use. Mills are holding out strongly, and the yards are rather weak in their demand, so that the wholesalers are finding business rather unsatisfactory. A considerable quantity of West Virginia spruce is being sold at prices showing a concession from the published list. Stocks of 13-ft. spruce in the Adirondacks and in Canada are reported to be light. The demand for these woods is only moderate, with the exception of 1¼ x 9, and 2 x 9, which are scarcer. The market is weak. Other sizes are in good supply and orders are promptly filled. There is not much improvement to be noted in the demand for Eastern spruce at Boston. Retailers are diminishing their stocks extensively, and if business continues even on a moderate scale they should soon begin to replenish. The price of frames has declined a little further during the last fortnight. They are now bringing $23.00 for 9 inch and under, and some of the dealers predict even lower prices. Manufacturers, however, say they will shut down rather than allow a further decline. Random is in quiet demand, selling at about $20 for stocks under 7 inches. The price of matched boards is from $21.50 to $22.00.

The demand for shingles at present is still unsatisfactory. There are large stocks in the hands of manufacturers, and it is reported that they are beginning to show greater anxiety to sell. Buyers are awaiting developments before placing extensive orders. Cedar extras are quoted at $3.25 to $3.50 and clears at $2.75 to $3. The demand for lath is quiet and prices are easy. The price of 1 1/8" ranges from $3.70 to $3.75, but even at these figures buyers are not taking much interest. For 1½" the price is from $3.45 to $3.50

Great Britain

The liner season for spruce deals is practically at an end. Recent parcel arrivals have sold at prices very little below market value, in spite of the fact that rumours to the contrary have been frequent. Recent parcel arrivals have been of very short average length, containing a lower proportion of 9 inch and wider deals, and the quantity of scantling sizes has also been small, the majority being 2 inch, 2½ inch and 4 inch thick, with a few 3 inch. C.i.f. prices for cargoes remain unchanged, but show a tendency toward firmness. The London market is rather quiet, but the demand is steady. Useful every-day sizes are still scarce. At Foy, Morgan & Co.'s recent auction sale 3 x 10 second Quebec sold at £9.10s., and 3 x 7 unsorted brought £8.5s.

The lumber trade at Liverpool seems to have improved considerably during the past fortnight. Spruce values are fairly steady, but prices are not very encouraging to the importer. They should, therefore, show a tendency to improve, as it is not usually necessary to cut prices at this early stage of the season. "Contracts to arrive" are being made upon the basis of £8.5s. per standard c.i.f. for ordinary specifications from St. John, N.B. From other New Brunswick ports and Nova Scotia, sales are being made to the Mersey and other good ports on the Lancashire coast at slight variations from this rate. There is a better demand for birch goods, and prices are somewhat improved, especially for spot values. Birch cargoes are in steady demand and firm. Quebec pine deals are a little easier in price than they were at this time last year, the lower grades being the least in demand. Quebec red pine is improving in demand, as it is being substituted wherever possible. Stocks are low and prices are advancing. Pine logs are higher than a year ago, and seem to have a tendency to advance still further.

At Glasgow there has not been very active business during the past fortnight. Arrivals have been confined to one or two liner shipments from Montreal on contract. A small quantity of Quebec spruce also arrived recently and sold readily at good rates. Quebec pine is rather dull, particularly for the lower qualities. Firsts are scarce, and whatever small consignments arrive are quickly sold at good prices.

United States

The hot weather, as usual, is having a tendency to diminish the buying of lumber in United States markets. During the past fortnight trade has been gradually decreasing, although up to that time the quantity of shipments had been fairly satisfactory. The most noticeable decrease is in the country yard business. Even at this, however, the trade is not as yet discouraging. At Chicago, good northern pine is firmer, the demand being better than ever before. No. 1 and No. 2 common are also in good demand. No. 3 has improved considerably, but there is only a poor enquiry for Nos. 4 and 5. The activity of the farmers in the country district accounts largely for the quietness in the country yard trade. The good crop reports give encouragement for a large fall and winter business. The hardwood markets at Chicago are quiet. Furniture factories are buying almost nothing. Plain oak seems to be a little weaker, but prices generally are maintained. Quarter-sawed oak is selling fairly well. Cottonwood and gum are also in good demand. Birch and maple are the best sellers among northern hardwoods, and prices are strong. Hardwood manufacturers report good business. There is an excellent demand for hemlock at Chicago. Supplies of dry lumber are light and prices are well maintained. West coast products are moving actively at Chicago. Western pine shop lumber remains firm, with orders fairly plentiful. The good weather of the past fortnight has improved the demand for Southern pine. A large amount of this wood is being consumed in building operations, and the door manufacturers and car shops are also buying it extensively. Trade in shingles and lath is rather dull. Red cedars at Chicago are lower than they have been for some time. Clears are selling at $3.27 and stars at $2.79. The cooperage trade is extremely dull.

White pine dealers at Buffalo find a better demand for Pacific coast stock than for northern lumber. Good white pine is in fair demand; prices quoted by manufacturers are firm. The hardwood situation at Buffalo is unchanged, and it is still a matter of considerable difficulty to get rid of the low grades. Firsts and seconds of all varieties of hardwoods are selling fairly well in moderate quantities. The trade and prices for hemlock at Buffalo are steady. There is a good demand, and the popularity of this wood seems to be on the increase. Washington fir is firm. Western pine at Buffalo is selling

SARNIA, ONTARIO

a little more actively; the supply is plentiful and prices are not too high to interfere with good business. There is a fairly active trade in shingles and lath at Buffalo. Stocks, however, are plentiful and prices remain somewhat slack. Red cedars are in the best demand, and are easily keeping the lead.

Market Correspondence

Ottawa Valley Trade—Business Quiet

Ottawa, June 25.—Lumber shipping from the Ottawa Valley is steady, as a rule. Here and there manufacturers report the market active, but nowhere is to be found any trace of brisk business except in odd lines. Recently the heaviest buying has been in birch, one inch good pine sidings, sound white pine box and assorted spruce. One dealer reports pine good sidings, 1 in. x 8 in. and up, as high as $55 per M. He states 1 in., 1¼ in. and 1½ in. good pine sidings are likely to maintain very firm prices. The brand 1 in. x 7 in. and up has taken a general advance of $1 or $2 per M. Pine box boards, in lengths 12 to 16 feet, are active. Sizes 1 in. by 3 in. are quoted at $15 to $16, and 1 in. x 7 in. at $16 to $17.50. Some of the latter has sold as high as $19. Bartram Bros. have loaded several barges of the best box lumber for New York, and they report the market keen there. The same firm handles birch extensively, and reports dry birch scarce and sales plentiful. Log run is firm around $20 per M. There is considerable business in ash. The log run is worth $29 per M., and common and better, 1 in. to 2 in., as high as $40 per M.

Slight reductions have been noted in several sorts of shipping and mill culls. Locally, spruce and hemlock are being substituted to a large extent for them, as builders get a sounder lumber for the money. The mill run spruce, when sorted, commands a good price for re-manufacture, and is eagerly sought for building. Lengths 12 to 16 feet are firm at from $16.50 to $19 for 1 in stock. Thicker spruce commands considerably more. One manufacturer reports the sale of two and a half million feet of spruce within the last few days, while it would have been very difficult to sell as much low-grade pine. In contrast with this, the opinion is freely expressed that low-grade pine is destined to remain a drug on the market unless some phenomenal consumption sets in or production is suddenly stayed.

Lath, shingles and railway ties are all a little weaker than a month ago. Shingles and lath have suffered a drop of ten or fifteen cents in the most plentiful brands, but makers of ties are holding prices up till a better market strengthens quotations. Many railway projects are in the air, but none of them have advanced sufficiently to warrant buying of building material. Telegraph poles are scarce, and some of the leading firms dealing in them are offering none for sale at present. Considerable of last yinter's cut is now being taken out of the river.

Rains have helped to keep up the water level in the Ottawa, which in dry spells sinks at the rate of three inches a day. The mills are running under favorable conditions in respect of power and log supply, and there is likely to be a good average production of lumber.

The increase in the number of craft on Lake Deschenes, near the popular resorts of Britannia and Aylmer, has brought the partially sunken logs in this water into prominence. Complaint is made in the local press that the Upper Ottawa Improvement Company should remove the logs. It appears that the percentage of these "dead heads" is very small, taking into account the great quantity of timber brought to the mills below Lake Deschenes, and that especial pains will have to be taken by some party if the stream is to be kept absolutely clear.

The Lumber Supply Company and Chaudiere Lumber Company are now incorporated under the new name of the The McAuliffe-Davis Lumber Company at $200,000 capital. W. H. McAuliffe, the well-known Ottawa lumberman, retains a big interest in the company. Others in the company are A. G. Gill, A. M. Davis, R. R. Williams, D. J. O'Donaghue, G. H. R. Wilson and M. E. Davis.

Practical demonstration was given at the W. C. Edwards Company lumber yards to F. M. Halstead, United States Customs Officer, of the advantages of the former way of measuring and invoicing lumber shipments compared with the method ordered by the U. S. Treasury Department on March 21 to become effective on May 1st. Fortunately for all concerned the U. S. Government had ordered their Collectors of Customs not to enforce the new regulation strictly until the representations of Canadian lumbermen were looked into. Mr. Halstead was commissioned to ascertain these views. About the middle of June he came to the Capital and had conferences with Mr. Frank Hawkins, Secretary of the Canadian Lumbermen's Association, and the U. S. Consul General, Hon. J. G. Foster. The order of the Treasury Department had called for a copy of the tally sheet showing the actual lading of each car, or in lieu thereof a specification of the number of pieces of each size and length of lumber. The copy was also to show if the lumber was rough or planed and the number of sides planed. If the sheets containing these particulars were not forwarded the cars were to be unloaded and the particulars obtained by examination. The Ottawa Valley lumbermen regard this proposal as useless, unnecessary and confusing. Through Mr. Hawkins the views of the Canadian lumbermen, which were all similar, were made known to Washington. From the explanations made to Mr. Halstead and the sympathy he manifested, he is convinced of the reasonable attitude of the Canadians. He saw the simple and complete method, long in use, of measuring the actual number of feet board measure in each piece when loading, and seemed to approve of it. Mr. Halstead also visited J. R Booth's yards and interviewed the veteran head of the business. The result of his investigation is expected to be made known shortly.

New Brunswick News—Good Business Outlook

Chatham, N.B., June 18th, 1910.

The lumber industry and trade have many features which point in the direction of a healthy and prosperous business for the rest of the season. This applies, generally speaking, to the province at large, although in sections where the manufacturers and shippers depend in part upon the American markets, the outlook is not as encouraging as to those who depend chiefly upon the English markets to dispose of their stocks. To the manufacturers and dealers of St. John, or vicinity, who have long or short lumber manufactured from "American" logs the prospects are, while by no means of a discouraging nature, not so attractive as to the lumbermen of Nova Scotia, the north shore of New Brunswick and other points where no logs cut on the American side are sawn.

Trading at St. John and vicinity for long lumber (spruce deals for the New York market, spruce scantling and boards for the Boston market) for export to the Eastern States is quiet and has shown little sign of improvement during the past month. Too many rumours and reports of a pessimistic nature are in circulation in regard to the American markets to expect any immediate improvement. It is stated that the big buyers on the American end are buying only such quantities as they need for immediate orders. At any rate there is no snap to the demand in St. John or other provincial points. Manufacturers who are interested in the American trade are by no means disgruntled at the many reports of a discouraging nature, and express their confidence that business will settle down and values reach a higher level as soon as buying of a nature preparatory and in advance of the fall demand for eastern spruce begins. An enquirer would be quoted on merchantable, one-inch, undressed, spruce boards (dutiable) from $14.00 to $14.50 per thousand superficial feet at St John and from $14.25 to $14.75 per thousand superficial feet at Miramichi ports.

Values on spruce random for the Boston markets are, considering that the outlook on the other end is not as rosy as might be, fairly firm and with no tendency toward greater weakness. An enquirer would be quoted from $17.50 to $18.00 for non-dutiable random two-inch spruce, f.o.b. schooner St. John.

The market for cedar shingles has shown no new features of importance for some weeks past. Production throughout this province has been quite nominal so far this season, and, judging from all indications, will be much the same or slightly less than the total output of last year. Trade in high grade shingles, "Extra" and "Clear" is quiet, but prices are holding their own, and no lower quotations than at present current are looked for. An enquirer would be quoted on dutiable "Extras" $2.65, and on dutiable "Clears" $2.15 at St. John. At a Miramichi port the quotations would be $2.40 and $1.90 per thousand for "Extras" and "Clears."

A considerable trade in cedar shingles is being built up between New Brunswick and the West Indies. A number of large shipments have been made during the past few months, and the trade is steadily growing. The trade calls for a low grade shingle, and the greater part of the shipments consist of Ex. No 1's or No. 1's, such as sell in the province at $1.35 and $1.00, respectively, per thousand

---

The dispute between the Powell River Pulp Company and the Sayward Milling Company, in respect to the use of booming grounds on Powell River, which was argued before the British Columbia Executive recently, has been finally disposed of by the Cabinet While fully appreciating the position of the Sayward Company, the government felt that it would not be justified in the adoption of a policy that would hamper or delay the realization of the benefits to the province to be expected from the prosecution of the pulp company's enterprise. As there is another available booming ground half a mile or so farther down the river, it is ordered that the Sayward Company remove thereto, the pulp company putting in for the timbermen the necessary new railway, the route for which will be selected by the provincial government engineer. The railway must be constructed and completed to the satisfaction of this official and at the expense of the Powell River Pulp and Paper Company. The company in question is required to give the right of way for the new railroad, and the Sayward interests are to be allowed ten years in which to complete the haulage out of their logs.

For the Camp

When purchasing your supplies of provisions remember that we make a specialty of this business and just at the present time can offer some lines at exceptionally interesting prices. If needing any dried fruits let us hear from yon.

Elmira Excelsior Cutting Machines

(Continued from page 34)

The speed should be 200 to 225 revolutions per minute. The capacity is from 40 to 70 lbs. excelsior for one table per hour. This depends largely on the speed, feed, kind of wood being cut and attention of workmen operating it. The floor space of single machine is 3 x 1 ft., double machine 5 x 1 ft. The height of the machine is 9 ft. 8 inches, but they can be made higher or lower to suit height of building. The power generally needed is between three and five horse-power for each double machine. The weight of the single machine is 900 lbs. and of the double machine 1,800 lbs.

Improvements to Disston's Philadelphia Plant

Henry Disston & Sons are making improvements to their establishment, the Keystone Saw, Tool, Steel and File Works, in Philadelphia, which will represent an additional investment of about $500,000. This includes the building operations completed in the last fourteen months, which takes in the erection of a storage warehouse, a pattern storage building, a blacksmith shop and a new machine shop with up-to-date equipment.

Foundations are now being laid for a two-storey structure, 180 x 43 feet, which will be another addition to the extensive file-making department. The building will be equipped with all modern operating machinery, all of which has been designed and built by the Disston organization.

In a few days work will be started on a two-storey building, 290 x 63½ feet, with an L 181 x 69½ feet, to accommodate the Machine Knife and Jobbing departments.

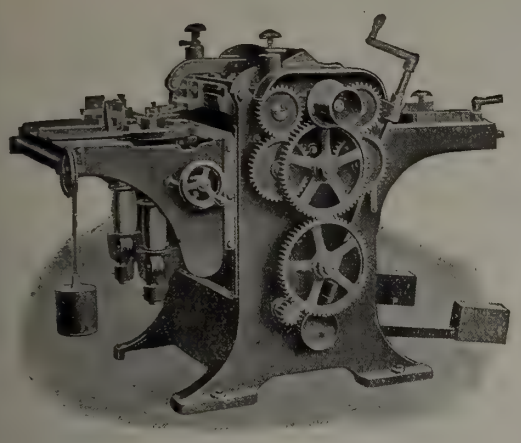
Incidentally, a large amount of new machinery, perfected by Disston experts, is being installed in all departments of the establishment.

At an early date, work will be started on a new building for the Cold Rolling department.

"The new buildings have been specially designed with a view to obtaining the maximum amount of light and the best possible ventilation.

It is a notable fact that all buildings in the big plant recently erected by Henry Disston & Sons in Toronto, Canada, are model structures in respect to light and ventilation. The old works there having been outgrown in the three years of its existence, the new buildings, in a more desirable location, with better transportation service, were planned, looking to increased and better facilities for the manufacturing of mill goods, such as circular, band, gang and cross-cut saws, etc.

Lidgerwood Skidders for Fraser River Company



The Fraser River Lumber Company, of Fraser Mills, B.C., have just placed an order for several "Lidgerwood Skidders." This is the machine that is attracting so much attention among the Washington loggers, a number of them having been recently installed in that State.

From the success they are having, the indication is that the "Lidgerwood" will shortly replace many donkeys now so generally in use on the coast. This "Lidgerwood" clears 40 acres at a setting, yarding and loading the logs through the air, so that no sniping or swamping is necessary, and the logs are delivered free of grit. While the regular crew for both skidding and loading is only fourteen men, the daily capacity is from 60,000 to 100,000 feet.

The Fraser River Lumber Company's machines will be the largest ever built, in order to handle their timber suitably. Some idea of the great size of these machines may be gained from their weight, which is approximately 90,000 pounds each. The new logging camp to be opened by the Fraser River Lumber Company will be the largest in British Columbia, with a daily capacity of 400,000 feet. Mr. A. D. McRae is president and general manager of their operation, which has the largest sawmill in British Columbia.

The firm of saw manufacturers, which has so long and favorably been known as Shurly & Dietrich, of Galt, Ont., have changed their name, and will in future carry on their business under the name of Shurley, Dietrich Co., Limited. The officers of the Company are J. C. Dietrich, President; W. W. Janney, Vice-President; J. Charles Dietrich, Secretary, and P. G. Dietrich, Treasurer. The original Company was established in 1873.

The new steam sawmill being built for the Nepisiguit Lumber Company, at Bathurst, N.B., is now receiving its finishing touches, and is expected to be ready to begin sawing early this month. This mill has been built upon the site of the old Adams-Burns sawmill at Bathurst, which plant with its timber rights was taken over by the interests represented by Fred S. Morse, of Springfield, Mass. The new mill is large and modern in every respect, and is equipped specially to cut spruce for the American markets.

Planing
Matching
Ceiling
Flooring
Novelty
Siding
Mouldings

We make the best line of medium size Planer, Matcher and Moulders on the market. When you buy a Cordesman-Rechtin Planer, Matcher and Moulder you are assured on four points:

1st—That you are getting the latest and most improved machine built.

2nd—That you are getting a well designed, well made machine, and one that won't give you any sort of trouble.

3rd—That you are getting a machine that will do good work and lots of it.

4th—That you are getting a machine that is fully guaranteed.

We make four different sizes and styles of these machines. One of these is sure to meet your requirements.

DISSTON Saws

"The Saws You See from Sea to Sea"

Disston Chisel Tooth Circular Saws

A few reasons why they have held foremost place in the milling industry in every part of the world:

Unfailing precision in milling and machining of V in Shank.

The shank or holder fits perfectly, and has a bearing along entire line of socket.

Gauging of bits is so accurate that a saw can be fitted with a new set and put to work without side dressing of any kind—you can readily understand, therefore, the smooth cut that is a notable character of these Chisel Tooth Saws.

Design of the tooth is different from all others. The bit is nearer to the line which gives least resistance in cutting.

After it is cut, the chip will move *downward* with a minimum of friction. Designs which cause wrong chip direction retard power.

Dust chambers are so large they will easily hold all dust that can accumulate in one cut. When chambers are small, they clog and choke down the saw.

Disston Chisel Tooth Saw blades are made of *high grade crucible steel.*

We make chisel tooth saws that are specially adapted for work in all parts of the world and with every kind of timber—bits alone are made in several hundred different sizes, gauges and widths of cutting edges. Size of tooth is varied to suit the work.

EDGINGS

Ontario

Mr. Bull's sawmill, at Skibbereen, about 12 miles from Cobourg, Ont., was destroyed by fire on June 16.

A London cable announces that the Dominion Sawmills issue has been underwritten to the extent of about 40 per cent., at about 3 per cent. discount.

J. D. McArthur's fifty-thousand-dollar sawmill at Atikokan, Ont., on the Canadian Northern, was burned to the ground on June 18. The planing mill and piles of lumber were saved. The mill will be rebuilt at once.

The McAuliffe-Davis Lumber Company, Ltd., Ottawa, Ont., have been incorporated with capital of $200,000. The incorporators are Wm. H. McAuliffe, Allan G. Gill and Albert M. Davis, Lumber merchants, all of Ottawa, Ont.

Fire destroyed the sawmill and lumber yard of Charles Mitchell at Powassan, Ont., on June 23. The mill and machinery are a total loss, and a large quantity of lumber was destroyed and damaged. The loss is about $7,000, partly covered by insurance.

Fire at the Scholey Bros., Ltd., planing mill, on Ontario St., Toronto, caused $3,000 damage recently. The loss is covered by insurance. The fire started in the engine and boiler room. A large amount of timber in the dry kilns was burned and the machinery was damaged by water.

The Parry Sound Lumber Company will have a stock of about 10,000,000 feet cut at the mills of the Ontario Lumber Company at French River this summer. The stock will be one-half pine and one-half hemlock. The hemlock has all been sold, we understand, to the American market.

Mr. Bull's sawmille at Skibbereen, in Haldimand Township, about twelve miles from Cobourg, Ont., was totally destroyed by fire recently. Two large traction engines, shingle mill and chopper, and a quantity of tools were burned. There was no insurance, and Mr. Bull's loss is heavy.

Fire did much damage to the Dyment-Baker factory on Bathurst Street, London, recently. The fire started in the sawdust and shavings. It is supposed that a spark got into the shavings The plant was destroyed once before, in 1905, and has since been rebuilt. The loss will not be heavy.

The Dunbar Lumber Company, of Elk Lake City, Ont., has assigned to E. R. C. Clarkson & Sons, assignees, of Toronto. The assets are estimated to be about $20,000 and the liabilities approximately $15,000. A statement of the affairs of the company is being prepared and reorganization is anticipated.

The installation of an automatic sprinkling system in all new planing mills will probably be recommended by Building Inspector Fotheringham of Ottawa. The Board of Control recently decided that J. A. Desrivieres should be given a permit for the erection of a mill to replace the one recently destroyed by fire.

The Canadian Crocker-Wheeler Co., Limited, which has just completed its plant at St. Catharines, Ont., has secured the contract for the complete equipment of the Big River Lumber Company's plant at Prince Albert, Sask., in which Messrs. Mackenzie & Mann are interested. This company owns over 500 square miles of timber, about fifty miles north of Prince Albert. A branch of the Canadian Northern is now being built into these limits, and a large sawmill and planing mill are in course of construction.

The question of reforestry is becoming a live one in Simcoe County, Ont. E. J. Zavitz, Professor of Forestry in the Guelph Agricultural College, addressed the County Council recently upon the possibility of profitable reforestration of the sand lands in the county, which are estimated to contain all told over fifty thousand acres. Mr. Zavitz held that reforestration would be a profitable investment and told what had been done in other counties and in Ontario. He was followed by James Lawler, secretary of the Canadian Forestry Association. A representative committee of six was appointed to deal with the matter.

An organized effort is to be made by the motor boat owners of Britannia and Aylmer, on the Ottawa River, to get ride of what they regard as a dangerous nuisance, the numerous dead heads and other logs and timbers in Lake Deschenes. They are talking of affiliating with the Ottawa Motor Boat Association and getting that organization to work in their interests. "Some of these dead heads have been there for years," said one boatman in an interview. Logs become water soaked and they turn up on end, and sometimes lie with the end a little below the water, thus becoming more dangerous than if they were partly visible. A gang of river sweepers could clear away all the dead heads in the lake in a few days, and thus remove a constant menace to life and property.

Eastern Provinces

It is expected that J. H. Crandall, Moncton, will shortly erect a new sawmill at Morrison's Cove, near Chatham, N.B.

The White Lumber Company, of Sussex, N.B., are reported to have bought the mills and timber areas of George D. Prescott, at West River, Albert County, for about $85,000.

A special meeting of the Bathurst Boom Company was held at the office of Adams-Burns Co., Ltd., in Bathurst, N.B., on June 30, for the purpose of electing directors and the transaction of other business. The general annual meeting was not held at the regular time.

J. P. Mullarkey, Ltd., Montreal, Que., have been incorporated with capital of $500,000, to carry on the businesses of timber, lumber, iron, etc., and to construct, operate, etc., water-powers, buildings. The incorporators are John H. Davy and John H. Brittle, accountants, Montreal, Que.

Various eastern railways, including the Boston & Maine, and also the Canadian Pacific, have agreed to postpone the date of a proposed increase of 10 per cent. in lumber rates from June 15 to August 1 in order to give the Interstate Commerce Commission an opportunity to investigate the proposed increases.

It is reported that American capitalists are negotiating for the purchase of the mills and lumber lands of the Scott Lumber Company, of St. John, N.B., owners of 35,000 acres and with 15,000 acres under lease. The lands are on the Shogomoc and Oromoco rivers, and there is a large block near Magaguadavic Lake.

The company are also the owners of the Victoria Pulp Mill in St. John, which is at present closed down, and they are operating a well-equipped mill at Magaguadavic.

W. H. Taylor, who returned recently from England, is reported to have disposed of two timber properties while over there, one consisting of about 300 square miles, situated near LaPolle Bay, and the other, 345 miles, at Bay St. George, Newfoundland. Both were sold to private parties, who will operate mills for the manufacture of pulp. Engineers are now on their way to examine the properties, locate sites and do all preliminary work in connection with the opening of the mills.

Western Canada

T. S. Lawley, lumber dealer, Blucher, Sask., has been succeeded by Lawley & Dunsted.

The Monarch Lumber Co. will start a new mill at Savona, B.C., in the near future.

Stone Bros., lumber and implement manufacturers, Rapid City, Man., have been succeeded by H. Hindson.

The Fort George Lumber and Navigation Co. are constructing another two-storey office building on Second Street, South Fort George, B.C.

Sparks from a bush fire ignited a sawdust pile, and the flames spread with such rapidity that Greer Bros.' sawmill at Mack, 88 miles west of Fort William, and 4,000,000 feet of lumber, the property of Vigars-Shear Lumber Company, were totally destroyed recently. The building and lumber were fully covered by insurance.

Mr. John Hanbury, manager of the Hanbury Mfg. Company, Brandon, Man., and Mr. J. H. Hines, financial manager, visited Montreal recently on business in connection with the Hanbury Securities, Limited. This is a financial concern organized for the purpose of controlling all the business interests of the Hanbury Company. Negotiations are under way at present through which it is likely that the Hanbury lumber and manufacturing concerns will greatly extend their operations.

The transfer of the Alberta Lumber Company, of Edmonton, Alta., from Carruthers, Round and Co. to Mr. Geo. W. Boughton has been effected, and the price paid is $12,000. Mr. Boughton, who is the president of the General Contractors' Association, has had much business experience in the East, having been associated with a number of enterprises in the cities of New York and Boston. The Alberta Lumber Company has been in existence about five years and has been eminently successful. During the last year they have been working to capacity. The plant is situated on Boyle Street.

Mr. Theo. A. Burrows, lumber manufacturer, Grandview, Man., whose intention to erect a new mill was recently announced in the "Canada Lumberman," reports that he will erect one of the most complete mills of its size in Manitoba or Saskatchewan. He expects to put in two double cutting Waterous band saws with a cluster edger taking a 12 inch. cant. The boilers and engines will be enclosed in a cement cut-off, and he will install thoroughly up-to-date machinery in keeping with these machines. At present he will run a small rotary mill to take care of his immediate needs until the larger mill is completed. The greater bulk of his machinery will be supplied by the Waterous Engine Co. The lath mill will be of Payette make.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry:

1062. **Pitch pine planks**—A Manchester firm wishes to correspond with Canadian exporters of pitch pine planks.

1063. **Hickory broom handles**—A Manchester firm asks for prices of hickory broom handles from Canadian manufacturers.

1064. **Pine deals**—A Manchester firm asks for dimensions and prices of pine deals from Canadian exporters.

1067. **Oak hubs**—A Lancashire firm asks for prices and dimensions of oak hubs from Canadian manufacturers.

1068. **Pick and spade handles**—A Manchester firm asks for prices of pick and spade handles from Canadian manufacturers.

1069. **Birch squares**—A Manchester firm wishes to correspond with Canadian manufacturers of birch squares, sizes 1-in. x 1-in. up to 3-in. x 3-in. in lengths of 2 feet to 4 feet.

1075. **Empty barrels**—A Liverpool firm wishes to correspond with Canadian shippers of empty barrels.

1078. **Spruce deals**—A Manchester firm asks for prices and dimensions of spruce deals from Canadian exporters.

1079. **Planed and rounded lapping boards**—A Manchester firm wishes to correspond with Canadian exporters of planed and rounded lapping boards.

1080. **Wood pulp boards**—A Manchester firm asks for prices and samples of wood pulp boards from Canadian manufacturers.

1081. **Spruce deals**—A Manchester firm asks for prices of spruce deals, all sizes, from Canadian exporters.

1083. **Builders' hardware, wood working machinery, railway motor cars, etc.**—A firm in New Plymouth, New Zealand, are in the market to purchase various goods under the above headings from Canadian firms. Bank references.

1086. **Long ash handles, broom handles, etc.**—A prominent firm of export forwarding agents in New York city can do large contract business in the above goods and would like lowest quotations, cash discounts, etc., from Canadian manufacturers.

1101. **Cask and barrel shooks.**—A fish packing firm in Venezuela wishes to obtain supplies of cask and barrel shooks from Canada, and invite quotations from Canadian manufacturers.

1104. **Agents**—A Sheffield company manufacturing saws and machine planing irons for wood, of heavy description, seek Canadian resident agents to act for them on a commission basis.

1035. **Wood pulp**—An Italian firm desires to import wood pulp from Canada. At present they import largely from Germany and Norway, but they wish to hear from Canadian exporters.

1050. **Brown wrapping paper**—A London firm wishes to be placed in communication with Canadian manufacturers of brown wrapping paper who can offer supplies for the Australian market.

For Sale to Close an Account
Crown Granted Timber Limits and Lands

in the

Province of British Columbia, Canada

The undersigned has received instructions from the owners who desire to close the account, to sell by private treaty

Forty Timber Limits and Lands

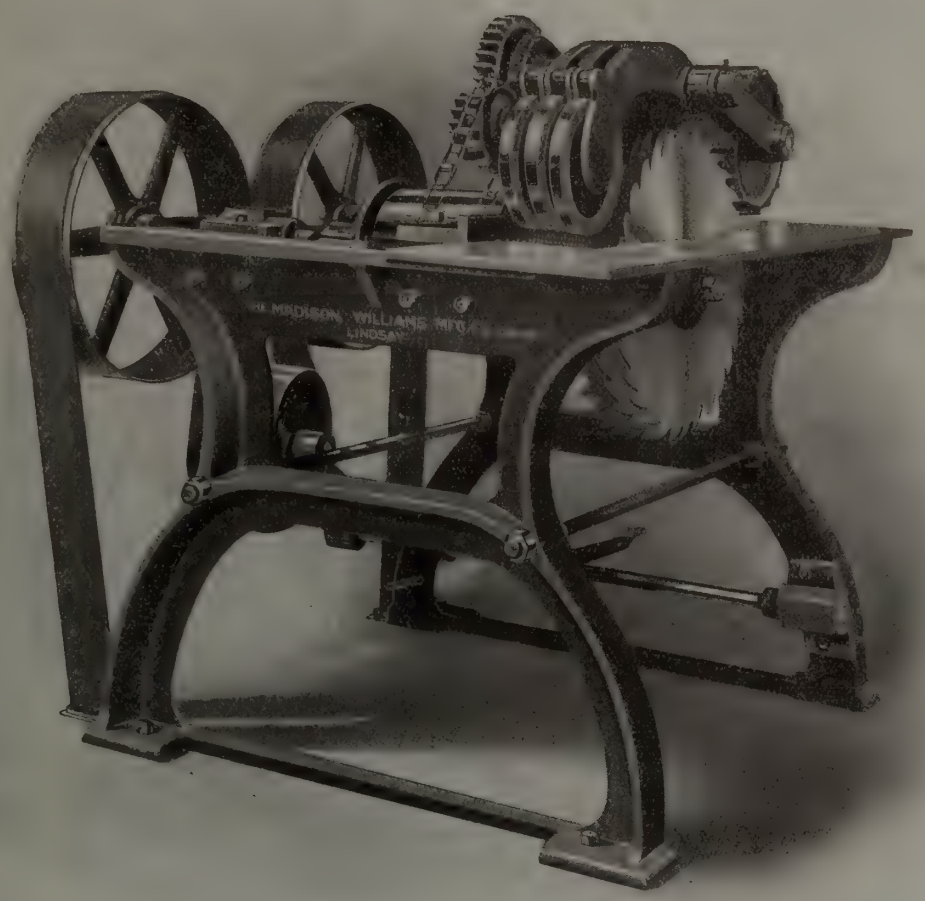
situate in the Salmon River Valley, West Kootenay, British Columbia, from thirty to forty-five miles north of the United States border, and upon, or contiguous to the Nelson and Fort Sheppard Railway which runs between Spokane, Washington, and Nelson, British Columbia, connecting with the Great Northern and Canadian Pacific Railways, and affording access to the United States and Canadian markets.

The limits contain in the aggregate thirty-eight thousand acres, and are comprised of bottom lands and benches of hills, constituting one of the best bodies of timber in the Central Southern part of British Columbia. Subdivision of the tract has hitherto been consistently refused. Individual limits contain from two hundred and fifty to twenty-one hundred acres, with from three million to forty-five million feet of Cedar, Pine, Hemlock and other woods of excellent quality upon them, in addition to large quantities of Cedar Poles—prices run from $5,000 up according to Stumpage and Location.

Some of the limits are essentially Cedar Pole Propositions, and contain large quantities of the very best quality of Cedar Poles from twenty-five to seventy-five feet in length, free of limbs

The properties are Crown Granted, and the timber upon them may be exported. The Timber is subject to a Royalty of fifty cents per thousand feet, when cut.

A considerable quantity of the land is available for fruit land when cleared, and the owners are prepared to give a deed of land and timber, or a license to cut timber only for a term of years, at the option of the Purchaser.



TERMS OF SALE:

In order to close the account, very easy terms of purchase will be given, namely, twenty-five per cent. cash, and the balance in four equal annual instalments, and twenty per cent. cash with balance in six equal annual instalments—interest at six per cent.—with operating privileges which will assist purchasers to pay for limits out of stumpage.

The character of the properties together with the easy terms of payment present a unique opportunity to persons of moderate means to acquire valuable limits for either operation or investment.

Prices and further information may be had upon application.

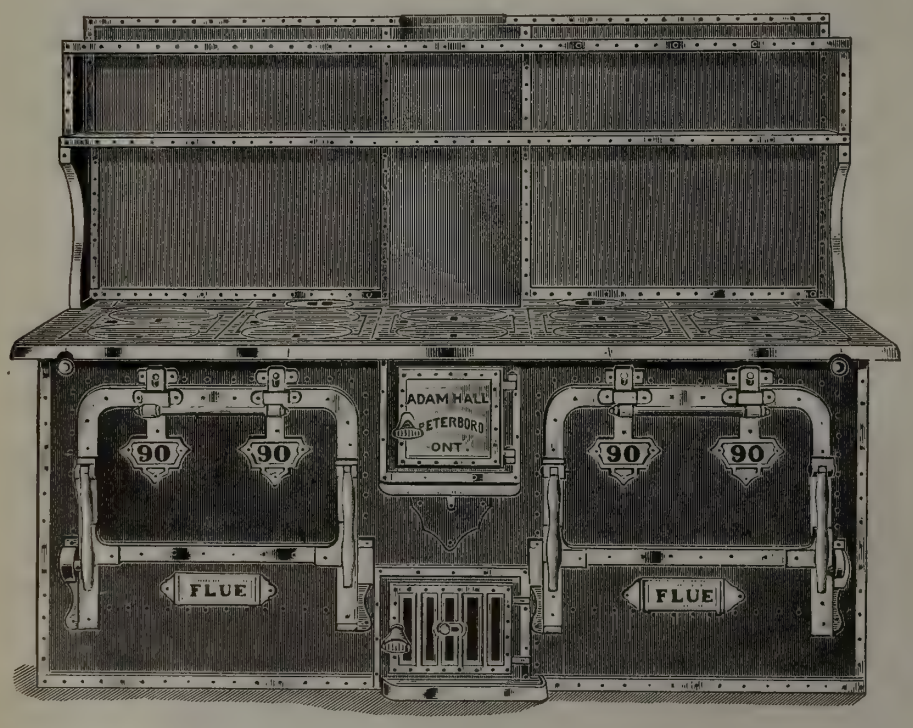
"It's the Quality that Counts"

The uniform high quality maintained from year to year in our

Lumber Camp Ranges and Heaters



has given them the first place among lumbermen in all parts of Canada.

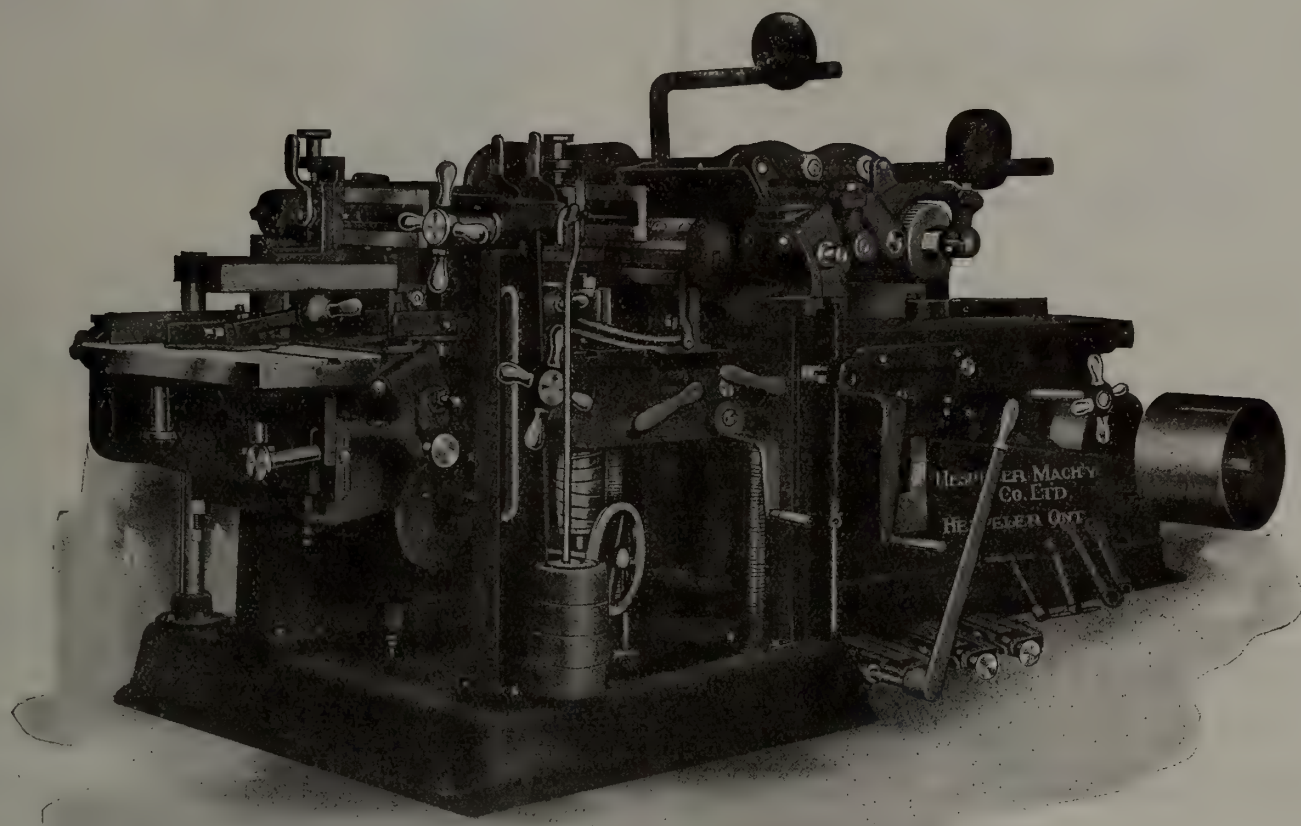
We can assure our patrons that the same quality of workmanship and material will be maintained in the future as it has been in the past and we solicit a continuance of your orders. We make all kinds of stoves for either large or small camps.

No. 10—36 Six Hole Leader Range and Reservoir

for either coal or wood. Fire-box for wood 28 inches. Without feet and hearth. Size of oven 24 x 28 x 16. Size of top, 54 x 30. Shipping weight, wood linings only, 450 lbs. Shipping weight, coal and wood linings, 550 lbs. Further particulars and prices in our catalogue. Write for it.

No. 10 — 90 Ten Hole Double Oven Range

for either coal or wood. Fire-box for wood 28 inches. Size of oven 24 x 28 x 16. Shipping weight, square 1,260 lbs. Shipping weight, with high shelf, 1,360 lbs. Shipping weight, with warming closet, 1,380 lbs. Fuller particulars and prices in our Catalogue. Send for it to-day.



We want every lumberman to write for our new Catalogue showing the most extensive line of lumberman's Stoves, Heaters, Stove Furniture and other utensils for the lumber camp. We guarantee absolute satisfaction to every purchaser. Deal with a firm that has a good reputation to sustain.

ADAM HALL, Peterborough, Ont.

Manufacturer of Ranges, Heaters, etc., for Lumber Camps, Hotels, and Railway Construction

The Moulder Without a Peer

Our Four-Sided Heavy Duty Moulder

Everything essential to a strong and well built machine is included in this moulder

The Feed is what is known as the down feed, is positive in its action, and has unusual strength, so much so that all ordinary material will pass through the machine without the use of weights on the lever.

All Gears are cut from the solid, which insures smooth operation and a feed free from vibration.

The Feed Control is by levers, one at the feeding in end of the machine and the other at the side of the table in line with the main spindles, as shown.

The Bearings on the upper and lower cylinders (three in number in each case) are what is known as the White's patent type, familiar to all users of modern machinery and leaves nothing to be desired.

The End Table with bottom head is adjustable on ways, the outer section having another independent adjustment. The end can be swung out of the way for access to the lower knives without disturbing the guides.

MANUFACTURERS OF QUALITY LUMBER AND SHINGLES

You Can't Stop It

So get a-board, or better yet, a car of boards or shingles and lath from our Quebec or New Brunswick mills

A little talk with a "Silk Finish" about our Fenderson Mill Products

Spruce This mill is still doing business at the old stand, sawing the same nice, small sound knotted Spruce, and turning out the finest dressed "Silk Finish" Spruce coming from Canada to-day. A full stock of 1 in., 1-1/4 in., 2, and 3 in., in any width always on hand. You can't stop it—the trade want it because its the best.

White Pine Old growth, gang sawn White Pine with a sound red knot of an excellent character, good dry stock—Tonawanda grades—and can be worked as desired. This is **real good goods.**

Shingles Our Fenderson 16 in. New Brunswick White Cedar Shingles are the same uniformly good shingles that we have always supplied. The Old Reliable Brand.

Lath The very best Canadian Spruce Slab Lath.

Any or all of the above in the same car
Remember! If it's Fenderson's—it's right

"QUALITY IS THE BEST POLICY"

Largest and Best Assorted Stock of Dry Spruce in Canada

One of the Best Investments for a Box Factory is a well built and modern Variety Saw

New No. 260 VARIETY SAW

It is a time and money saver, not only in manufacturing boxes and shooks, but a variety of other work will drift into a box shop occasionally, which only a **Variety Saw** will be able to handle and the profits on these orders will usually put any returns from the choicest of box orders away on the shady side.

We call your attention to a brand new machine made especially for variety work in box factories, jobbing shops, etc. namely,

Our New No. 260 VARIETY SAW

This machine possesses advantages in quick and accurate adjustments over any other variety saw and will be found a decided improvement in Ripping, Crosscutting, Boring, Bevel Sawing, Cropping, Grooving, Mitering, etc.

We invite you to write for Circular 11-R which tells all about it

Hamilton, Ont.

Hanchett Band Swage

Filers! Mill Men!

Success in lumbering depends upon the extra large cuts over the regular cuts, and turning out better lumber. In other words it is turning out more lumber at a less cost. Now our specialty is labor saving machinery for the care of saws. We manufacture all kinds of machinery and tools for the care of saws. One of our best tools is our Hanchett Swage. This tool presses the tooth widest on face, widest at extreme corners, and tapers the tooth downward and backward. Our swage shaper then presses the tooth to an ideal shape and each tooth exactly alike thus doing away with a great deal of filing and making a stronger and better cutting tooth.

Hanchett Swage Works

The Spark Extinguisher

shown in illustration was sold by us about a year ago to the Chicoutimi Pulp Co., Limited. It has been so satisfactory that we have just shipped two others to the same company for use at other mills. If you use wood for fuel you cannot afford to be without this apparatus. It is guaranteed to extinguish all dangerous sparks and will not affect the draft. Made to fit any stack or chimney.

Craig Street West, MONTREAL

Its High Daily Average, its ability to always keep a surplus of logs skidded ahead for the leading crew is what places the

CLYDE SELF-PROPELLING STEAM SKIDDER

in a class by itself. Its absolute independence of the loader prevents any interference with its fullest skidding capacity at all times and its self propelling feature saves in both moving and skidding besides the expense of switching.

BRANCH OFFICE AND WAREHOUSE NEW ORLEANS, LA. — **CLYDE IRON WORKS** — BRANCH OFFICE SAVANNAH, GA.

SOLE MANUFACTURERS OF THE McGIFFERT AND DECKER PATENT SELF-PROPELLING STEAM LOGGING MACHINERY.

DULUTH, MINN.

Say Old Chap!

Do you know that I had quite a lot of second-hand machinery that was no use to me so I put a small "ad" in the **"Canada Lumberman"** and sold the whole line? The "ad" only cost me a couple of dollars and I got ever so many replies.

Why don't you sell those old machines of yours, there are lots of fellows who would be glad to get them?

The "Wanted and For Sale Department" of this paper is buying and selling second hand equipment every day.

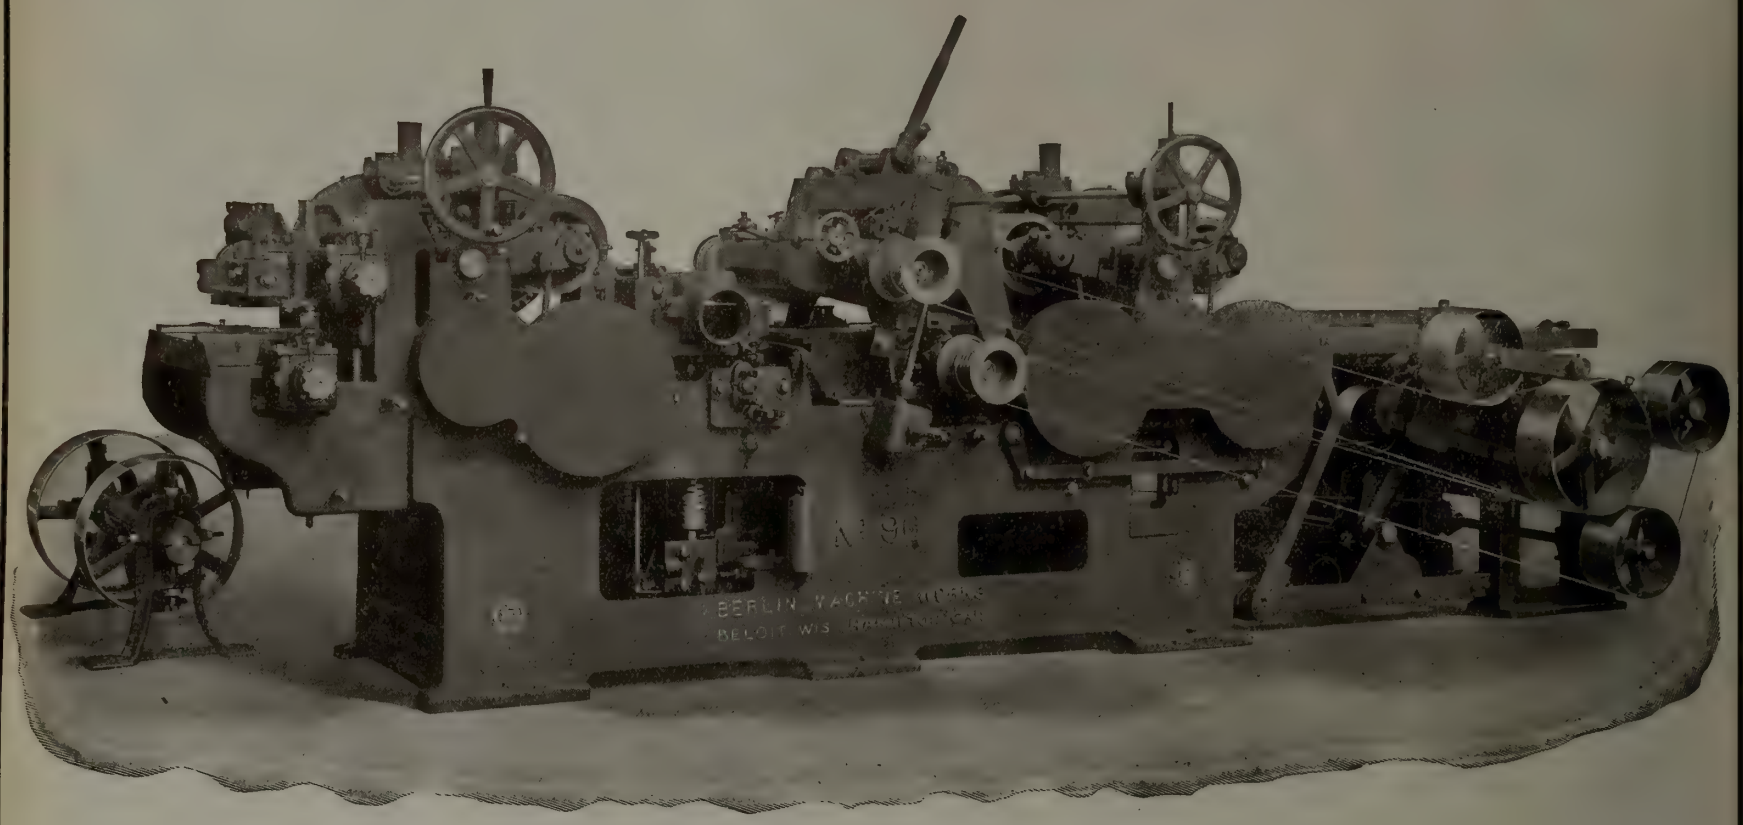
RESULTS ARE WHAT COUNT

A Combined Skidding and Loading Machine that will clear up the largest area at a setting and can be moved and set up in the shortest possible time will get the best results.

The latest Russel machine has some distinct features that save time and trouble, consequently money. Note the new method of suspending skidding sheaves. They are hung from a vertically hinged jib or triangle, the outer end of which is guyed by two lines one on each side, which are power-tightened and can be set while skidding lines are going out. The guy lines lead back so they do not interfere with skidding or loading. The uppermost leg of the jib has a spring connection to the tower, reducing shocks. All



skidding strains are absorbed by the guy lines. The swinging boom is operated by wire ropes passing through sheaves suspended from a steel frame projecting from tower and leading to two drums on loading engine, controlled by one lever. Machine is raised or lowered by hydraulic or patented gear jacks. Built for 2 or 4 lines, with stiff or swinging boom, constructed entirely of steel, except loading boom. Is without question the strongest and fastest machine of the day.

RUSSEL WHEEL & FOUNDRY CO., DETROIT, MICH.

INVESTIGATE THE NEW METHOD

No. 90 Planer, Matcher and Profiler

You can make the highest quality of flooring on the new No. 90 Planer and Matcher at 200 feet per minute. We will prove that you can do this. Our guarantee of proof is conservative because flooring has been run on the No. 90 at more than twice this feed in our own factories. The machine is built strongly enough and is powerful enough to stand up to a feed of 500 feet per minute—so when we say that you can run "A1" flooring at 200 feet per minute, you see that our statement is really conservative.

All your outline work (drop siding, beaded partition, lap rustic, V ceiling, casing, etc.) can be run on the No. 90 at 150 feet per minute! Think of it! And even at this very fast feed you will get better work than you can get from any moulder or four head matcher at 50 feet per minute.

In other words, you can do much better work and three times as much of it with the No. 90 as you can get from any other four head machine. Stop and think this over! It means a whole lot!

The No. 90 is a simple, substantial machine built for speed and hard work. Every part performs a duty—there are no superfluous pieces.

The machine is equipped with the powerful Automobile Chain Drive.

It is also equipped with the "Berlin" 6-bit Round Top and Bottom Cylinders which will handle twice as much stock as a soft knife machine and at the same time save you 15 to 30 per cent. in grades.

For flooring, we furnish you 12-bit side heads especially designed for this fast feed work. At a feed of 200 feet per minute they will not tear out even the knots and cross-grained places as much as other heads will at 60 a minute.

If you have not received a copy of the June "Berlin Quality" Bulletin, you should write for it NOW. It contains four pages of description about this Fast Feed Working of Flooring and Outline. It is worth your careful reading.

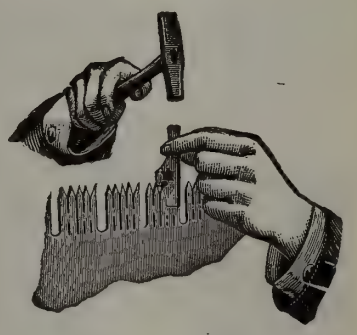
This Saw Stands Without a Rival

AND IS THE

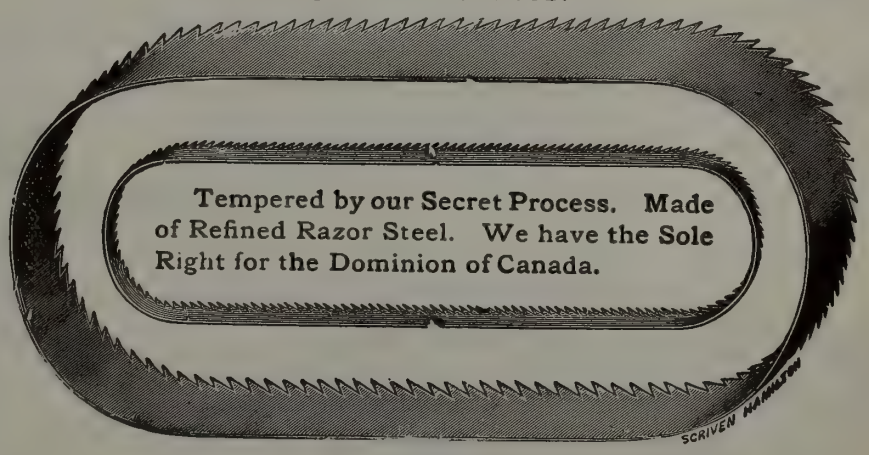
FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.



Maple Leaf Saw Set

MANUFACTURED BY

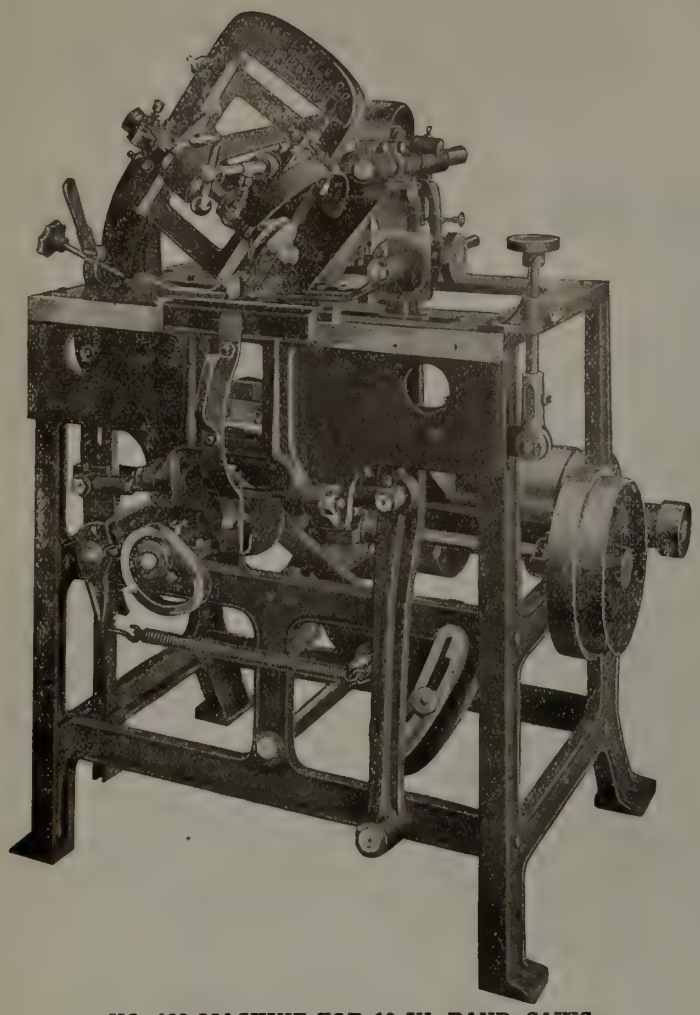


SHURLY DIETRICH, CO., LIMITED

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Razor Steel, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

NO. 120 MACHINE FOR 10 IN. BAND SAWS.

SAW MACHINERY

The Most Efficient Band Saw Sharpener Made

Equipped with **new automatic idler** bracket keeping the belt to the emery wheel at the same tension as it travels up and down. Idler pulley is located on slack side of the belt and can be adjusted in line with the emery wheel. Belt is held to same tension at all times by a large spring. There are **no flange pulleys** used on this machine, with the use of automatic idler the life of the belts is prolonged. **Head** is constructed with 60 degree angle shaped slides on both sides so that **wear can be taken up by adjusting one gib.** Every wheel arbor can be adjusted so that a straight wheel will do the same work as a concaved one. Head is adjusted to a 45 degree hook.

Saw rest is moved up and down by hand wheel at the right hand side of the machine, convenient for the operator. Adjusting screw is so placed that it **cannot become covered with emery dust.** The saw rest is made of self hardening steel and can be easily replaced. **Back feed** is of a new design and is strong, simple and effective. The adjustable eccentric cam on the cam shaft is connected to the long back feed shaft by means of a lever, this lever rocks the back feed shaft that moves the back feed arm. Back feed finger can be turned out of the way and allow saw to be lifted up without interfering, machine is equipped with an **adjustable cam.**

To those interested in the highest type of machinery of this kind we invite your inquiries and ask permission to send detail description.

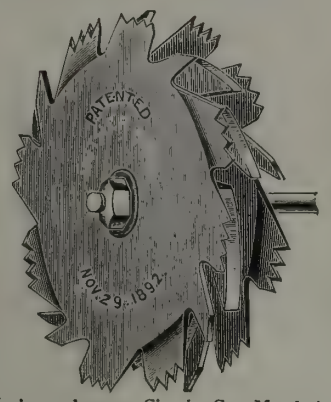
HUTHER BROS.



Hollow Ground Combination Tooth Mitre Saw

For either Rip or Cross Cutting

Will cut equally as smooth in either Ripping Cross-cutting or cutting at an angle of 45 degrees, with grain of wood.

Patent Groover or Dado Head

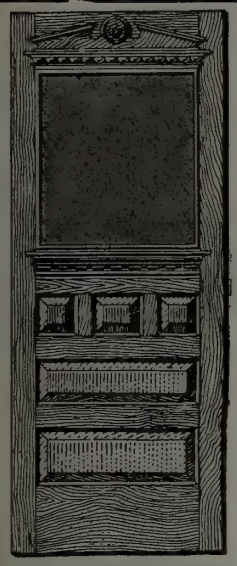
Can be used on any Circular Saw Mandrel

For cutting any width groove from 1/8" to 2" wide. Will cut either with or across the grain (Sent on approval).

Allow us to quote Prices on Saws for any special work that you wish to do.

HUTHER BROS. SAW MFG. CO., Inc., ROCHESTER, N. Y.

KEBO BALATA BELTING



For wet drives there is no belting made to equal **KEBO** Balata.

KEBO Belts are stretched in the making. Each ply of Canvas is treated separately thus thoroughly impregnating the canvas with the adhesive solution and making the finished belt uniform and impervious to moisture. Even long soaking in brine does not impair **"KEBO."**

We back up our claim for **KEBO** by fully guaranteeing every foot you buy.

Write us about your belting needs—the first order will mean repeat ones. Orders for **KEBO** satisfy both you and ourselves.

Our Steam Tension Band Mill will increase the cut of any plant

Because—The top wheel is steam operated and it can be lowered and raised in ten seconds, when changing saws.

Because—A seperate steam cylinder operates the upper guide. Steam is bound to operate faster than any friction drive. Therefore, the oftener you have to move your upper guide, the more time the steam tension mill will save you.

Because—For the above reasons you have more time for sawing.

Hardwood Flooring "Empire" Quality

Just Rockhard Facts

When you want Maple or Beach Flooring of "Empire" Quality, flooring which has been mave from good lumber and has been kiln dried and manufactured properly, and grades which hade not been "blended" to meet price competition—send us your orders.

Competitive stock bought at a lower price is not a good advertisement to you if it results in a dissatisfied customer who will soon forget the diffe ence in price but he will not forget the poor flooring.

Regardless of price our high standard of quality will not be changed, nor shall we try to fool you by mixing grades.

"Empire" Quality results from good lumber, superior millwork, years of experience, and the most careful and systematic attention to detail exactness.

PRICE and QUALITY are not equivalent

Come To Us If You Want Woodwooking Machinery

A well designed re-saw with details properly worked out. Every convenience and attachment that is essential to a model re-saw.

Some of its merits:—

The Feed Works are driven by belt and changing from one feed to the other can be accomplised by simply turning a hand wheel one quarter of a turn. Each machine has five changes of feed.

The Saw runs within 1 inch of the centre of the back roll, cutting the stock while it is firmly held. When doing bevel sawing the feed works can be drawn back by a lever to prevent the saw striking the rolls and the safety lock is so arranged that the rolls can not be tilted until the feed works are drawn back from the saw.

The Frame is cast in one piece, cored out hollow underneath, is heavily ribbed and perfectly rigid.

The Rolls are driven by spur and bevel gears all cased in. All gears cut from the solid and as near noiseless as possible.

The Hespeler Machinery Co., Limited

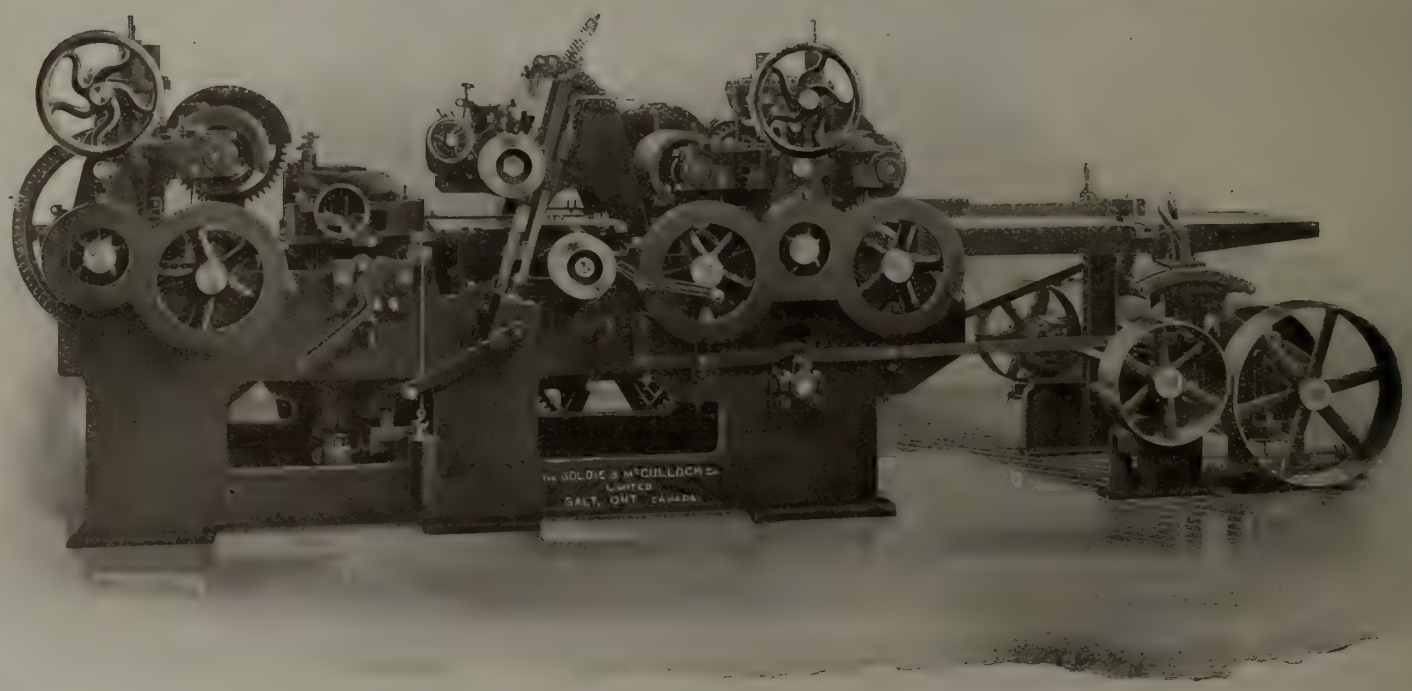
Hespeler, Ontario, Canada

WE have been making Knives seventy-eight years, long enough for us to be sufficiently sure of the Knives we make, to give an unqualified guarantee of satisfaction with them.

The steel used in Simonds Canada Saw Co., Limited, Knives is our special crucible steel, made in the Simonds Steel Mill especially for Simonds Saws and Knives.

Thus you will see we start right, and thereafter the steel is handled most skillfully until the finished knife is produced.

Whether you want Planer, Veneer, Stave, Shingle, Moulder or any other woodworking machinery knives, you may go as far as you like, try as many makes as you like, you cannot improve on Simonds Knives. Of course, different conditions require different knives, a difference in the temper most likely. Given an idea of the kind of woods to be cut, the machine on which the knives are to be used, and the dimension, we guarantee to give you Simonds Knives that will be perfect in balance and temper exactly right to do the greatest amount of smooth cutting with the least amount of wear and care.



When you buy Knives, always buy Simonds

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For Manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 30 Toronto, July 15, 1910 No. 14

Companies' Act Creates Criticism

It is difficult to realize that the Government of British Columbia are really serious in their frequent attempts to penalize companies doing business in British Columbia which have not been registered or licensed by the Province. On July 1, the one day of all the year which is devoted to the idea of unity among the provinces of the Dominion, the Legislature of British Columbia brought into effect an act which will be considered with alarm by every Canadian and British establishment carrying on business in British Columbia. Briefly, the new act requires every company (other than those originating in the Province) which desires to carry on business in British Columbia to be registered or licensed by the Provincial Government. Companies having an established business outside of the Province, in which at least one-half of their capital is invested, may commute the license fees for $250. Companies doing business without a license or registration render themselves liable to a penalty of $50 a day, and agents $20 a day. Debts due to companies not licensed or registered cannot be collected under the law of the Province.

There are thousands of manufacturing establishments in Canada which will be adversely affected by this law, among them being a number which are interested in lumbering. Manufacturers cannot sell a single dollar's worth of goods in the Province, and if they should do so in spite of the law, the customer could with impunity refuse to make payment. An unlicensed publishing company in another Province cannot send a copy of its paper or journal to a British Columbia subscriber. If its agents canvass for subscriptions or advertising, they are liable to a penalty of $20 a day. The company's subscription bills cannot be collected. Railway companies cannot operate their trains. Banks, even though they have Dominion charters, cannot collect upon commercial paper, and many other equally serious disabilities are imposed upon establishments of all classes unless they see fit to establish a head office in the Province and empower an attorney to act for them therein. The act was passed in spite of strenuous opposition from Victoria Board of Trade and the Board of Trade and business men generally of Vancouver. The general belief is that unless the Government decides to repeal the measure, it will be appealed to the Privy Council, if necessary. From the history of similar appeals in the past, it seems probable that this course could have only one result —the repeal of the measure in toto.

Government Helps to Bear Prices

For many years the lumber manufacturers of Canada have urged upon the Canadian Government the necessity for a protective duty upon lumber entering this country, but the voting power of the farmer has always bulked so largely in the eyes of the Government that they have systematically sought his favor in every possible manner, chief among the methods being the free-lumber sop. This does not apply to any one government or another. "Protective" and "tariff for revenue only" policies have alike included "free lumber" for the great farming voter to build his houses and barns, and for the protected manufacturer of agricultural implements to turn into reapers, harvesters, etc. Governments no doubt believe that they understand the best interests of the whole people better than anyone else, but the continual changes both in legislation and in election results prove that they are often in error. In regard to lumber, they have surely been ignorant or indifferent to the necessities and the deserts of one of the most important of the country's manufacturing industries. Not only does the rough lumber imported into Canada free of duty have a continually disturbing effect upon the stability of this great Canadian industry, but, as has been pointed out frequently in these columns, the free importation of lumber in a finished form, such as veneers and staves, has gradually served to extinguish many important wealth-producing industries.

In regard to rough lumber, the Government's policy is to give the consumer of lumber the benefit of competition from foreign lumber. Its policy in this regard is proclaimed as a patriotic concern for the consumer. Lumber manufacturers are therefore ground between the upper and nether millstones, and at the same time they have not the benefit of free access into the markets of their chief competitors, the manufacturers of the United States. Indeed, the Government of the United States, in spite of the rapidly waning supply of lumber in that country, consider that their patriotic duty is very different from that of the Government of Canada, which is far less seriously threatened by a timber famine. Rough lumber entering the United States pays no less than $1.25 per thousand feet duty. Contrast this with our Canadian policy. Not only does our Government open the gates to foreign lumber, but by its own action invites competition, and in its patriotic defence of the Canadian consumer, buys its lumber, where it sees a bargain, from the United States manufacturers. A few years ago, this was the course adopted by the Government of Ontario in securing lumber for the construction of stations on the T. & N. O. Railway. Of course the Ontario Government does not make the customs tariff, and is to some extent justified in seeking the cheapest market. It is a different matter with the Dominion Government, however. Not only do they invite foreign lumber into Canadian markets, but right in the country which depends largely upon its lumber industry—British Columbia—they ignore the Canadian manufacturer, when they think fit, and obtain their supplies of lumber from the mills of the United States. In Seattle, to-day, Canadian orders for United States lumber are a feature of the local trade. The Grand Trunk Pacific—virtually a creation of the Canadian Government—recently placed orders for 3,000,000 feet of lumber at Puget Sound points. At the same time the line yards of Alberta, Saskatchewan and Manitoba are purchasing large quantities of lumber in the Pacific Coast States. The Weyerhauser Mill, at Everett, Wash., is shipping, and has been shipping for a month or two, a carload of lumber a day to Canada.

The Government of Canada has probably no control over the Grand Trunk Pacific which would enable it to insist upon its buying lumber from Canadian manufacturers. There are, however, we believe, stipu-

lations in thte act for the creation of the G. T. P., requiring it to employ, so far as possible, both Canadian labor and materials in its construction work. Without great stretching of authority, such requirements could surely be used for the encouragement of the Canadian manufacturers of lumber. There would not be quite so strong a case against the purchase of G. T. P. supplies in the United States if there were a great difference in the price, making it more profitable to buy the foreign lumber; but such is not the case. Reports from Seattle even state that the price obtained for the lumber sold in Canada is from one dollar to one dollar and a half greater than could be realized on the same freight rate by Pacific Coast mills in Canada.

It will be claimed by those who favor free importation of lumber into Canada that the Canadian mills are unable to supply enough lumber to fill the present excessive demand from the prairies, and that, if there were a duty on lumber entering Canada the prices would now go so high as to make them an unfair tax upon the consumer. This would be the case if a duty were suddenly imposed to-day, but conditions at present are abnormal, and the mills of Canada, if they had been protected in the past, would now have capacity sufficient to meet even such an abnormal demand without advancing prices greatly.

The lumber manufacturers of Canada are so scattered, and in the past have been so lacking in organization, that they have been unable to impress the Government with the magnitude of their importance and the reasonableness of their claim for a protective duty. The time may still be far in the future when they will be able to succeed in this direction, but the situation at present prevailing on the west coast is one which should open the eyes of the Government to the fact hat proection of the farmer, if allowed to run mad, may become a dangerous factor in trade depression, for there is no doubt that, so soon as the present excessive demand for lumber begins to decline, the United States mills will do their utmost to retain the hold they have secured upon Canadian markets. With a declining volume of trade, the Canadian manufacturer will have to face an increasingly aggressive competition from mnufacturers across the line, who themselves have the advantage of freedom from Canadian competition in their own markets.

An Interesting Experiment in Co-operation

Lumber manufacturers will be much interested in tthe experiment which is being made by Mr. A. E. Watts, president of the Wattsburg Lumber Company, of Creston, B.C., in the direction of encouraging his employees by giving them a direct interest in the company. Co-operative plans have been tried under various circumstances, and it seems to have been proved that in certain cases they work out successfully. The best circumstances are those in which the employees are made partners in a practical sense. There is a limit, of course, to the amount of actual stock that can be given in this manner to an average employee, without adversely affecting profits; but it is certain also that a carefully devised plan of co-operation can be made to produce actual profit, to say nothing of the improved social conditions resulting to all concerned, and the freedom from labor difficulties which is promoted. The frequent failures that have resulted in co-operative undertakings have mostly been in cases where a number of people of mutual interests have banded themselves together to undertake a line of business in which they have had little or no experience. Where the business is already well established, and the co-operative plan is introduced as a measure of encouragement for the employees, the chances of success are good. This is the state of affairs in connection with the Wattsburg Lumber Company, as explained by Mr. Watts in a recent interview. Mr. Watts said: "My proposal of making employees partners is to give them a real business interest in the business in which they are engaged, and I do not propose asking men to purchase shares (they are not for sale), but will each year distribute a certain proportion of shares to the employees who exhibit a real interest in the business in a practical way. These shares will be fully paid up, and will carry no liability with them, and will be given according to the worth of the men and their ability and the measure of success they make. My idea is to attract good men, who wish to make permanent homes, and for that purpose we have reserved lands near our mills which will be either sold on easy terms or leased to workmen under perpetual lease. Lumber and all necessary articles for construction of permanent residences will be supplied on time and at wholesale prices.

"With the high wages men can now earn at our works in logging camps, in the sawmill, and in the sash and door factory, if they own their own home, with an acre or two of land, if attended to in their spare time, they can save at least half of their wages; and it is a well-known fact that an acre of the productive land of the Kootenays can produce from $100 to $200 worth of produce annually. Therefore, if he chooses he can be practically independent in the course of a few years, besides becoming a partner in a lucrative business. But it is distinctly understood that we have no use for drones or men who are looking for easy snaps, and also that when we are giving our shares as an inducement to attract good men, they are not getting shares in a bogus concern, but in a concern whose assets are worth over half a million. Neither is a sawmill of this kind a temporary business."

If diligently pursued, this plan ought to make of the Wattsburg Lumber Company one of the most prosperous and at the same time interesting concerns in the lumber business. The working out of the plan will involve, above everything else, a patient, careful and conscientious oversight of the work of every employee. It can readily be imagined that some of the unfavored ones will imagine themselves ill-treated, and will, if discharged, do their utmost to discredit the company. The plan will have to stand upon its own merits. Mr. Watts is to be complimented upon his courage in undertaking such a scheme. He no doubt believes that, commercially, it can be worked out to a success, and that not the least of the benefits resulting will be the increased profits of the company, which must necessarily result from securing a staff composed of competent and ambitious workmen.

Railway Freight Rate Troubles in the United States

The movement on the part of the railroads to increase their freight charges on lumber is not confined to Canada. In the United States the same thing has recently occurred, and the same stubborn fight on the part of shippers is in progress, although somewhat better success has been met with by the shippers across the line than by those in Canada. The situation in the United States was dealt with in a very practical manner recently by B. F. Dulweber, in an adddress to the Lumbermen's Club, of Cincinnati. Mr. Dulweber said in part: In fixing freight rates, the railroads do not base their charges on the cost to them of the service performed, as all other business is transacted to-day, but arbitrarily fix a rate without regard to such cost. These rates are fixed at "what the traffic will bear"—in other words, what the public will stand for.

This basis of ratemaking has resulted in low rates where the people interested have made a hard fight and have brought influences to bear to keep the rates down; while those lines of trade that have not made much of a fight in this direction have secured extremely high rates.

Unfortunately, the lumbermen do not seem to have given this matter the consideration to which it is entitled, and their demands for lower rates or objections to increases in rates in the past have been few, and those few have been made in a half-hearted way.

The result of this is—and I want you to clearly understand this—that the present rates on lumber are several times higher than those on any other commodity, when based on the actual cost to the carrier

I do not deny that there are rates in effect on certain commodities which perhaps are too low. In fact, I believe that there are some commodities which are being transported by the railroads at an actual

loss; but as we have seen from the previous figures which I have quoted, the average results do not justify any increase; and I maintain that each commodity should bear its own burden, and not one commodity pay part of the freight on the other, as is now the rule.

The profit to the carrier of transporting lumber to-day is many times greater than that of transporting any other commodity, so that we are making up with the freight that we ship the losses that the railroads experience in handling other freight, and are making a profit for the railroads on such freight as is handled without a profit, as well as paying them a good profit on our own. This, I think, you will all agree with me, is not right, and I believe that rates should be so based as to compel each commodity to pay its fair proportion.

I believe it is clearly established that even the present rates on lumber are exorbitant. I might add that a comparison could be made with practically every commodity that is handled, and discrimination against lumber would be found.

The thought may occur to you that we of the lumber business are not so much concerned in whether lumber is paying more or less than it should, in that eventually the consumer pays the freight. This is perhaps true to an extent, and the argument of the railroads that it does not make any difference what the freight rate is so long as everybody pays the same and all sections are treated alike, may have held good once upon a time, but conditions to-day are changed.

Lumber is no longer the absolute necessity that it was a few years ago. The price has materially advanced, and in the higher grades at least we find competition of metals and other substitutes for lumber, so that we are concerned in transporting our lumber as cheaply as possible in order to meet this competition.

It must also be borne in mind that the quality of timber that is being sawed to-day is much inferior to that of a few years ago, with the result that we have a greatly increased production of the lower grades of lumber.

The present rates on lumber are such that in many cases the cost of putting this low-grade material to the consuming market is more than the value of such lumber at the point of shipment

We all know to-day that there is a large accumulation of low-grade lumber at the mills, and I attribute this condition more to the exorbitant, unfair freight rates on lumber than to anything else.

In conclusion, I would urge upon you the necessity of prompt and unanimous action, and, as I have previously said, it will be necessary to prepare our case well. We are unquestionably right, but it will be necessary for us to fight hard in order to prove it.

Editorial Short Lengths for Busy Readers

A prediction that will be most welcome to British Columbia mill men and loggers, if it comes to be realized, was that made by Mr. John O'Brien, of the well-known firm of Brooks-Scanlon-O'Brien, at the recent Forestry Commission session at Victoria. "Within two years," said Mr. O'Brien, "the duty will be removed on lumber going into the United States, and mills in British Columbia will soon be manufacturing the low-grade cedar." Mr. O'Brien has been called as a witness in connection with the request made by the loggers that the export of rough cedar be permitted.

Timber Inspector Haslam reports that there is no diminution in the output of logs, and a tremendous surplus is being created, owing to the large number of firms engaged in the business in B C. His estimates of 600,000 feet per day in excess of the cutting requirements of the mills, still holds good, and there will be much work for the newly organized British Columbia Log Brokerage Association to do if prices are to be maintained and the cut of the small operators taken care of in order to prevent a serious drop in values a little later. So long as loggers insist upon producing so largely in excess of the demands of the market, they can expect little sympathy for their request for temporary permission to export logs to the United States.

The minimum carload weight for freight cars in Canada is likely to be materially altered in the near future, as a result—according to the statement of the Canadian Freight Association—of the increased size of cars which are now being drawn by the railway companies. Any change of this nature will, of course, have an important bearing upon shipments of lumber. Elsewhere in this issue will be found a statement which is being circulated by the Canadian Lumbermen's Association in connection with this matter. The subject should be carefully considered by all shippers of lumber, and it would be of great assistance to the Secretary of the Association if those who have any objections or suggestions to offer in connection with the matter would fall in with his proposal and send him their ideas as soon as possible.

The letter appearing in the last issue of The Canada Lumberman and Woodworker upon the necessity for a duty on veneers entering Canada dealt with a subject of importance to all veneer manufacturers. Referring to this question, another correspondent—one who was engaged in the manufacture of veneers on an extensive scale, but had to close his plant because of the competition of United States veneers—says: A brief comparison of the tariff on veneer of the United States and Canada is the best evidence that I know of that it is necessary to do something in connection with the Canadian tariff. The veneer business is one which is particularly well adapted to Canada, and Canada should be a very large shipper of veneer, not only to the United States, but abroad. Protection at the present time is not adequate, and I believe it is of the greatest imporance for veneer manufacurers to take united action in securing relief.

In the closing hours of the session in the Quebec Legislature of this year, another move was made by the Government which indicates their determination to keep Quebec's supply of timber for home manufacture. This was in the form of a bill which, by its innocent wording, escaped any general notice. The essential clause read, referring to a certain act: "Timber to be cut on lands granted by way of subsidy in virtue of this act is subject to any regulations ordering the manufacture thereof within the Dominion which the Lieutenant-Governor-in-Council may enact." This "afterthought" of Sir Lomer Gouin brings upwards of three millions of acres, which has been granted as subsidies to railroads, under the recent order-in-council which forbids the exportation of timber cut on Crown lands in an unmanufactured state. It means a big restriction on the amount of available timber which may be exported.

"The real reason for the desire on the part of the railroads to advance rates is not that such advance is essential to yield a fair return on the value of the property, but to further the stock jobbing operations of Wall Street," said B. F. Dulweber recently in an address to the Lumbermen's Club, of Cincinnati. "We all know that the actual operation of the roads has become but a secondary consideration, and is merely the means through which some of the railway powers gather enormous profits by the manipulation of the capitalization of their properties. For some years the plan has been, as soon as the stock paid dividends, to issue more stocks and bonds; in other words, pour in some more water, and, by extra pressure brought to bear on those in charge of the operating departments, pay a dividend on this water, and when this dividend was secured, still more water was poured in, and the same operation repeated again and again. The point has now been reached, however, where the operating departments of the railroads are securing maximum results from those in their charge, so that to permit the enhancement of their private fortune, to further increase capitalization or indebtedness, it is necessary to find some other means of increasing their earning power, so as to pay dividends on this increased capitalization; therefore, they now say to us, 'It is necessary to increase rates.' Will we stand for it? I don't think so." The recent stock issues and "melon slicing" in connection with Canadian railroads have no doubt the same relation to increased freight rates as they have in the United States.

Will Increase Minimum Carload

Canadian Freight Association Adopt Proposal of Serious Importance to Shippers—36,000 lbs in Place of 30,000 lbs.

The Canadian Lumbermen's Association have recently been advised that the Canadian Freight Association intend to increase the minimum carload weight of all classes of freight. As this will have an important bearing upon lumber shipments, the Association has drawn up a circular upon the subject and submitted it to its members. The secretary of the Association, Mr. Frank Hawkins, Carleton Chambers, Ottawa, would appreciate it if readers of the "Canada Lumberman" would let him know their views upon the matter. The circular is as follows:

The Canadian Freight Association, which represents practically all railways in Canada, proposes to revise and increase the carload minimums in the Canadian classification, and if adopted apply same to all tariffs, class or commodity.

The matter is of vital importance to every shipper, and you are asked to give it careful consideration. If you find that the proposition is unreasonable or cannot be complied with, so far as you are concerned, please to write to the secretary, stating fully your objections and reasons therefor.

To illustrate how the proposed change would affect shipments of lumber:

The Proposition:—The present minimum carload weight provided under section "A" of rule 1 of the classification, and that proposed, are as follows: 10th class, present minimum, 30,000 lbs.; proposed minimum, 36,000 lbs.

The above weights are for cars not over 36 feet 6 inches in length, inside measurement (or platform measurement of flat cars). No change is contemplated in the minimum carload weights of traffic now carried at commodity rates requiring higher than classification minimums.

The principal reasons advanced by the railway companies in support of the revision are:

(a) The larger cars in service, as compared with the equipment in use some years ago, when the present minimum weights were established;

(b) The average carrying capacity of the equipment having increased approximately fifty per cent., it is not considered unfair to increase the minimum carload weights approximately twenty-five per cent. on traffic which can be loaded to the proposed minimum weights;

(c) The proposed advance will bring about a more economical use of cars in the interests of both shippers and railways, especially in times of car shortages;

(d) Many commodities are now being ordinarily loaded up to and in excess of the proposed minimums. In such instances, the proposed change does not impose any new obligation upon shippers.

In order that the Canadian Lumbermen's Association may have the fullest information on the subject, replies to the following questions are suggested:

(1) Do you now have any difficulty in loading up to the required carload minimum weights?

(2) If so, is it because of the bulky nature of the goods: because of the inability of the purchaser to take the quantity on account of the limited market; because of cars being supplied of shorter length than 36 feet 6 inches, or because of cars being furnished unsuitable for the lengths of lumber to be loaded?

(3) How, and to what extent, would you be affected by the proposed increase?

(4) Would an extension of the mixed carload privileges be of any assistance to you? If so, in what way?

(5) What is average weight per car of your shipments, of different kinds of lumber, say, extending over three consecutive summer months?

Railway Companies Standing Pat

Ottawa, July 11.—The railway companies have done nothing yet in regard to the protest of the Canadian lumbermen against their tariff schedules on lumber shipped to Montreal for export by water. It will be remembered that the C. P. R. and G. T. R., in response to the order of the Railway Commission, filed new schedules purporting to be, "on the whole, lower than the domestic rates." These rates, filed on June 15 last, did not come up to the expectations of the lumbermen in the least, and, through Mr. Frank Hawkins, Secretary of the Canadian Lumbermen's Association, the railways were notified of the lumbermen's objections.

Although a fortnight has elapsed, the C. P. R. has taken no notice of the complaint. On behalf of the G. T. R., Mr. C. A. Hayes, general freight agent, has written Mr. Hawkins that the order of the Railway Board has been complied with, according to their interpretation. He asks the lumbermen to point to any features of the new rates that are not substantially in accord with the judgment.

The lumbermen take the attitude that the railway companies are obliged to make their tariff conform with the order, and are not likely to compile a tariff, or part of a tariff, for them. In respect of the G. T. R., there is the omission of filing any new export tariff at all for transportation from points in Quebec to Montreal or west of Ottawa.

When the matter comes to be finally adjusted, the lumbermen will insist on the reduction for export rates being made according to the views of the Railway Commission expressed during the hearing of the case. The Commission intimated at one time that the percentage of increase in export rates should be no greater than the percentage of increase in domestic rates. In the old tariff there was often a marked difference in the two rates. When the increases went into effect, and special export rates were practically withdrawn, the shippers of lumber for export suffered most. The attempt at readjustment in the new schedule filed last month provides a shade of preference for export lumber from some points, but the percentage of increase remains far above the ratio of increase for domestic lumber.

Until these issues are dealt with, the question of reimbursing the lumber shipper for overcharges will remain in abeyance.

Ontario Sash and Door Association Formed

The sash and door manufacturers of Ontario held their second meeting in Toronto on June 30, and after considerable discussion decided to form an association, to be known as the Ontario Sash and Door Manufacturers' Association. The following officers were elected: President, W. D. Cargill, of the Cargill Planing Mill Co., Cargill, Ont.; Sec.-Treas., F. W. Brennen, of the M. Brennen & Sons Mfg. Co, Hamilton; Executive, R. E. Truax, of R. Truax & Son, Walkerton; C. Lloyd, of C. Lloyd & Son, Wingham, and J. Evans, of P. W. Gardiner & Son, Galt, Ont. The principal object of the association will be the betterment of trade conditions by means of periodical meetings, at which various matters of importance may be discussed and dealt with. The association involves no binding requirements whatever upon any of its members.

B. C. Shingle Men Defended

Editor "Canada Lumberman."

Sir,—We have read with interest your extract from a letter dealing with British Columbia shingles, published in your issue of May 15th. We, of course, do not know from whom the complainant has been buying his shingles, but in justice to the established and reliable firms that are now, and have been, manufacturing shingles for a number of years, this complaint requires an answer. It is beyond question that a great deal of thought and careful attention has been given by the straight shingle men to the production of a first-class article, and I don't think any of the well-known B. C. firms would allow the packing of shingles of a known lower grade inside bunches marked as a higher grade.

As B. C. red cedar shingle manufacturers, we believe in our goods, and claim there are none better. We also believe there is no ordinary-priced material that can compare with a good shingle as a roofing material.

We are sorry to find that some dealers are buying Star A Star shingles for use in our good Canadian market, and respectfully submit that the handsome profits made by Mr. Retailer on shingles will at least warrant his buying a make of shingles that he can guarantee to his customer, and thus avoid his troubles. We would respectfully suggest also that more buying be done direct from mills instead of through brokers, some of which buy any shingles they can get cheap enough.

B. C. shingles are to-day (with all the benefits of grading associations in Washington), commanding a higher price in the United States than the Washington-made article—a result of persistent maintenance of uniformity of both grade and manufacture.

ALBERT COTTON, Vancouver, B.C.

The above letter should be read in connection with the letter appearing on page 26 of the "Canada Lumberman" of Julv 1, dealing with the same subject from another point of view. There is no question of the excellence of the major portion of the output of B. C. shingles, but unfortunately there is also no question that there are pirates in this business, as in all others, who trade upon the good reputation of others and do a great deal of harm. Public discussion of the matter will, it is hoped, assist in making it difficult for these people to carry on their dishonest methods.—Editor.

The British Columbia Provincial timber inspector estimates the actual cut during 1909 at 750,000,000 feet. The cut in 1900 from licensed, leased and Crown-granted lands in the Province was 250,647,493 feet, while in 1909 it reached 579,310,960 feet. In 1900 the total (Provincial Government) revenue from timber in the Province amounted to $145,766; in 1909 it reached $2,343,907.

Fire Fiend Takes Heavy Toll

Gillies Bros. West Yard Destroyed—Heavy Losses at Tomiko—William Milne and Sons Lose their Mill

Ottawa, July 5.—In one of the worst lumber yard fires in the history of the Ottawa Valley Gillies Bros., of Braeside, forty miles up the Ottawa river from the Capital, last evening, lost between 25 and 30 million feet of lumber, chiefly white and red pine. The flames were confined entirely to the west yard. The east yard, cedar yard and Malloch's yard, were undamaged, and both of the company's mills escaped, so that taking everything into consideration the company feel that they escaped fairly well. The east and west yards contained, roughly, about 43 million feet of lumber, almost all red and white pine. Of this the east yard contained approximately from 12 to 15 millions, leaving 25 to 30 millions in the west yard, which was destroyed. The value of the lumber burned was from $500,000 to $550,000. The insurance was carried on both yards as one risk and amounted to about $740,000. It is divided among about fifty companies. The lumber burned was probably one-half s. c and better (No. 3 barn and better), the balance being box and mill culls. About 75 per cent. was white pine. The quantity of lumber consumed is about equal to a good season's output of the Gillies mills.

It is understood that the firm was in fairly good shape as far as stock taking is concerned. This will greatly facilitate settlement with the several insurance companies involved. Despite the large insurance the blow to the lumber company will be serious. About 500 men were employed in the lumber manufacturing and shipping at Braeside and all these are temporarily thrown into confusion. Although the lumber was insured, the loss of tracks (of which there were over four miles in the yard), piling frames and rollers, pile bottoms, etc., is estimated to involve about $50,000 and the company also have to take into consideration the loss from the mill being idle, which will be considerable. The company immediately commenced work on repairing the damage to the yard and have now a couple of tracks in shape, so that they may start sawing almost immediately.

Gillies Bros., Limited, have been at Braeside for thirty-seven years and this was their first fire of any consequence, a fact which speaks volumes for the careful and business-like management of the company.

The yard visited by the fire is known as the old yard. It is about a mile long, beside Chat's Lake and 100 yards from the main line of the C. P. R. Railway tracks run into the piling grounds. Herein lies the only explanation of the conflagration. At six o'clock a C. P. R. shunting engine was in the yard coupling a number of cars loaded with pine. An hour later the fire was discovered near where the engine had been. Very soon the blaze had possession of several acres of the dry lumber and the reflection was visible fifty miles distant.

Fire brigades from Arnprior and Carleton Place were on the scene within an hour. Their efforts, with the labor of hundreds of individual fire fighters kept the flames from reaching the new piling ground of the Gillies firm, a few hundred yards nearer to Arnprior. A great quantity of pine and cedar are stored there. No lumber was piled in the yard, now fire-swept, since last August.

The space between the two yards served as a barrier to the fire. If the flames had gained the second yard the town of Arnprior would have been threatened. The C. P. R. lost five loaded cars of lumber and four empty cars.

The great loss has renewed the advocacy for the Railway Commission enforcing better regulations for the protection of lumber and forests from the menace of engines. There is no certainty of the fire being caused from engine sparks, but no other cause is apparent.

On June 30, a disastrous fire broke out at Tomiko, Ont., which destroyed about 20,000,000 feet of lumber, valued at $250,000, at the Tomiko Mills. The owners of the lumber were Ferguson & McFadden, the Temagami Lumber Company, and The De Laplante Lumber Company of Toronto. The wide space maintained between the mill and the lumber piles was the only thing that saved the former from destruction. The lumber was well covered by insurance. About a quarter of a million feet of lumber was all that was saved in the yard. The lumber destroyed was very largely high-grade stock. A full season's supply of logs is on hand, and the mill, which is a large one, with two double cutting bands, will soon have stock enough produced to meet the more urgent demands of the market. The capacity of the mill is about 100,000 feet a day. The fire is believed to have originated from sparks from the lumber company's yard engine.

The saw mill of Wm. Milne & Sons, Limited, Spanish River, on the C. P. R. Soo Branch, has been destroyed by fire. The loss is forty thousand dollars, and the insurance thirty thousand. The lumber piles were saved. The origin of the fire is unknown, but an investigation will be held into allegations of threats from discharged employees. New machinery had just been installed, and the mill was working day and night at full capacity, making even a greater loss just at this season.

A disastrous fire broke out recently in Joliette, Que., resulting in the destruction of the Copping saw mill, with a loss of about $75,000. There is no insurance. For a time the Poitras mill and other buildings were in serious danger. Seventy-five men are temporarily thrown out of employment. The mill will be rebuilt at once, as from 250,000 to 300,000 logs are floating in the river awaiting sawing.

The Atikokan Lumber Company's big mill at Atikokan, Ont., on Rainy River, was destroyed by fire on June 30. The large timber limits of the Hines Lumber Company, one of the best in the section, were swept by the flames One hundred men worked three nights and days to save the village of Mine Centre, and the saw mill at that place, with success, although the smoke and heat were intense.

Fire recently destroyed the saw mill and lumber yard of Charles Mitchell, at Powassan, Ont. The mill and machinery are a total loss, and a quantity of lumber was destroyed and damaged. The loss is about 7,000, partly covered by insurance.

The manager of the Rat Portage Lumber Company, of Winnipeg, reports that the company's loss by bush fires in the Rainy River district exceeds $2,000,000.

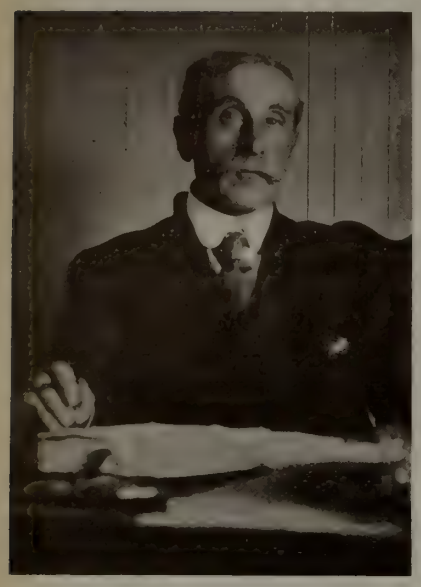
A portable saw mill and 12,000 feet of pine lumber were burned near Brockville recently. The mill was owned by W. Warren, of Lansdowne.

B. C. Fire Warden's Report

Chief Fire Warden, Wynard C. Gladwin, has transmitted to the British Columbia Minister of Lands his general report of the work done throughout the province by the divisional and district fire wardens during the month of May. In this report it is pointed out that the extremely dry weather during April rendered conditions especially dangerous during early May, and it was during this period that most of the reported damage was accomplished. This was especially the case of the interior, and while excellent work was accomplished by the fire wardens, as shown by the returns, the organization was not yet perfected in the early period, as the districts have all been rearranged, and reallotted, and the new fire wardens have yet to become acquainted with their territories. In all 129 fires took place, originating from causes as follows: Twelve from campers, nine from donkey engines, thirty-two from settlers, twenty-eight from railway locomotives, and forty-eight from unknown causes. The amount of standing timber destroyed was 1,300,000 feet; 65,000 feet cut logs on brow. The amount of cordwood destroyed was 142 cords; 15 cords shingle bolts. The quality of timber destroyed was 1-3 good, rest fair. The value of timber destroyed was $6,000. The number of men engaged fighting fires, 471; wages, $2,024; expenses incurred by owners of timber lands, $1,000; expenses of fire wardens, $2,447.25; miscellaneous, $270.10.

Rates for fire insurance on lumber camps will probably be considerably increased when the new schedules are published by the companies, as a result of the recent conflagrations in the northern forests. Mr. John A. Robertson, secretary of the Fire Underwriters' Association, states that it is probable the rates on lumber camps will be increased, but that there is no change contemplated in the price for insurance on lumber itself. The rate on lumber camps at present is five per cent.

Forestry Secretary on Tour in the States



Mr. James Lawler, Secretary of the Canadian Forestry Association, is making a tour in the United States. He will visit Washington to study the methods of organization of the American Forestry Association and to meet the officers of that association. He will also study the method of management of the Bureau of Forestry. Mr. Lawler will also visit Philadelphia and meet some of the officers of the Pennsylvania Forestry Association. He will then go to the Yale summer school at Milford, Pa., and spend three weeks studying there. Afterwards Mr. Lawler will return to Toronto for a few days and then go to Ottawa where in future he will make his headquarters.

Nipegon Pulp Limits to be Sold

The Ontario Government will shortly advertise for sale the right to cut pulpwood in the Nipegon Limit, which is tributary to Nipegon River and along the shores of Nipegon Lake. The successful tenderer will have to erect and equip a paper mill at a cost of $500,000, and no export of the products will be permitted except in the form of paper. This concession was advertised for sale two years ago, but the tenders were not satisfactory.

Lumbering Progress in New Brunswick

Active Developments in the Restigouche and Miramichi Districts—An Eighty Million Foot Boom—Interesting Details Regarding the Principal Saw Mill Companies

A. H. Hilyard, Manager of the Dalhousie Lumber Company

From a lumbering standpoint, the Restigouche and Miramcihi Rivers are probably the most important ones in the Maritime Provinces. All along the shores these two rivers are dotted with saw mills of every size, all just now busily engaged, and some working at night as well as at day. The very dry weather which prevailed this year in March, seriously interfered with logging operations, making it difficult to get the booms down stream, and consequently rendering the timber more expensive by the time it reached the mills.

A visit to the Restigouche River would hardly be complete, from a lumber standpoint, without a view of the immense boom brought down the river annually by the Restigouche Boom Company.

It was the privilege of the representative of the "Canada Lumberman" to view this boom recently, and it is only when one sees this mass of 80,000,000 feet of logs, that an adequate idea can be obtained of the immense business done in the lumber line in the vicinity of the town of Campbellton, N.B. This year's drive will exceed 100,000,000 feet, and is all consumed by the Campbellton and Dalhousie mills.

The Restigouche Boom Company, Limited, is capitalized by the lumber firms of these two places and operates under a Dominion charter. Its incorporation has minimized the work of the different firms, which heretofore brought their logs down separately. After the logs are cut by the owners, they are taken charge of by the Boom Company and brought down to the mouth of the river. Until this year the company could only use one side of the river for rafting purposes, which made the drive down very slow and tedious, but a new charter has been secured, and from now on the entire river can be used for rafting purposes, thus greatly facilitating the bringing down of the logs.

Campbellton, on the south side of the boundary river, Restigouche, is a town of over 4,000, and is rapidly growing. Its chief and practically only industry is lumbering. Here are located several large lumber concerns. One of these is the Shives Lumber Company, Limited, the largest lumber consumers in New Brunswick. Over 45,000,000 feet are annually used by this firm in their three mills, in which 400 men find employment. Around their largest mills, just on the outskirts of the town, there has grown up quite a village, all owned by the company and called Athol. Here they have built houses for their employees, which are given them at a nominal rental, a schoolhouse, a church, and other modern conveniences. Their long lumber mill is one of the most up-to-date in the province, fitted with all the latest machinery, and capable of an output of over 250,000 feet per day. The products of this firm find a market all over the world, in England, South America, and Australia, as well as our own continent.

A Section of the Restigouche Boom Coy's 80,000,000 ft. Boom

Long-Lumber Mill of the Shives Lumber Company, Campbellton

The William Richards Company, Limited, are also large manufacturers located at this point. They make a specialty of deal lumber and shingles. They have several mills and employ a large number of men.

Although a comparatively new concern here, operating only about a year at this point, the firm of K. & V. Nordin, Limited, are running to their full capacity. They are now building two new kilns to hold 90,000 feet of lumber, and are also putting in a new planer, which will double their capacity for next year.

The Alexander Lumber Company, who have heretofore specialized in shingles, are adding a long-lumber plant, with which they will be in a position to turn out all grades of lumber.

The Chaleur Bay Mills Lumber Company, operating on the opposite side of the river from Campbellton, have a fine mill, which is ocmparatively new, the old mill having been destroyed by fire about a year ago.

Other operators at this point are: B. A. Mowat. W. H. Miller and J. & D. A. Harquail Company, the latter being a woodworking establishment.

Long-Lumber Mill of the Dalhousie Lumber Company

Coming down the river to Dalhousie, we find located one of the most progressive lumber firms on the Restigouche, the Dalhousie Lumber Company, Limited, the vice-president and general manager of which is A. H. Hilyard, one of the best known lumbermen in the Maritime Provinces. Mr. Hilyard has been connected with the lumber industry for over a quarter of a century, coming to Dalhousie from St. John in 1903, when the Dalhousie Lumber Company first started operations, having bought out the business of Geo. Moffatt. About four years ago the plant was destroyed by fire, with the result that on the site there has now been erected a most up-to-date mill in every particular, fitted with the very latest machinery, which turns out over 25,000,000 feet of long lumber a year. Besides their long lumber mill,

the company also operate a shingle mill at this point, and last year's output in shingles alone was over 40,000,000. Their shingles are considered standard, and find a ready market. They also manufacture a large quantity of pulpwood yearly. Over 300 men find employment in their mills.

Operating at this point also are Bearinger & Chain, of which C. A. Doyle is manager. This firm intend in 1910 to treble their output, and are preparing for one of the largest cuts since they started in business.

It will thus be seen that the Restigouche is a most important lumber centre. Over one hundred million feet will be sawn by these firms this season, made up of spruce, fir, cedar and pine.

The Miramichi River is also the centre of a great lumbering industry. On its shore there are a large number of mills, having a tremendous output. To mention all separately would be practically an impossible task within the scope of this article, but many changes and additions are being made which are worthy of note. At South Nelson, three large firms are at present operating: T. Lynch & Co., Geo. Burchill & Sons, and John O'Brien. Mr. O'Brien has lately purchased a new planer and matcher, which will treble the capacity of his mill. Mr. O'Brien has been in the lumber business for over forty years,, was for fourteen years a member of the Provincial Government, and is at present sheriff of Northumberland County. This year he has had built a splendid steam tug-boat, which is named the " J. O'B."

The present month will see a number of additions to the already large number of mills on the Miramichi. Messrs. D G. & G. D. Buckley are erecting a new saw mill at French Fort Cove, which will add materially to the volume of the lumber output, as well as provide work for a large number of men. The mill will contain a stock-gang and rotary, and will have a daily capacity of about 45,000 feet of long lumber and 30,000 to 35,000 of laths.

W. & R. Walsh, of Chatham, have also started a new mill. It is only partly fitted out as yet, their lath machine being the only part of the plant in operation. The firm are somewhat uncertain as to their future operations, owing to a doubt as to whether or not the Government will expropriate their property in connection with the new banch line of the railroad. As soon as this is settled they will install a rotary for the manufacture of long lumber, as well as a box machine for the manufacture of box-shooks.

J. H. Crandall has started a new mill at Chatham, which is a portable with a lath machine. The capacity will be about 20,000 feet of long lumber per day and 15,000 to 17,000 of laths

In addition to the already large mill property now owned by the J. B. Snowball Company, of Chatham, they have purchased the saw mill at Millerton owned by Vanderbeck & Sons, of New York. This mill is equipped with a rotary and a lath machine, and has a daily capacity of 25,000 superfiicial feet of long lumber and about 12,000 to 14,000 of lath. The power is supplied by a boiler with a capacity of 150 h.-p., and an engine of 85 h.-p. The mill was built three years ago at a cost of $18,000. Included in the purchase is a valuable tract of timber land. This firm have also recently started a box plant in connection with their Chatham mill.

The Swedish-Canadian Lumber Company of Nordin have added another saw mill to their property, having bought the mill at Rexton formerly owned by Curran Bros.

Since the above article was written a fire has completely wiped out the town of Campbellton, N.B. The fire occurred on July 11, having originated in the William Richards Company's shingle mill. The loss is reported to be over $2,500,000, and it is reported that seven lives were lost. The buildings destroyed included the William Richards, Shives and Mowat mills and a number of smaller lumber manufacturing plants. The fire continued throughout July 11 and the day following. The town is nearly a mile long, and it is reported that not a building is left standing. Assistance was sent from Dalhousie, several miles distant. Fire also broke out in Dalhousie, but was subdued by hard work. A fire broke out also in the Miramichi Company's pulp mill at Chatham on the same day and considerable damage was done.

Logging Machinery in Canadian Woods

Increasing Adoption of Steam Power Methods Indicates a New Era in Woods Work—Companies which are Doing the Pioneer Work

Probably the most significant feature of the lumber business in Canada to-day is the extent to which manufacturers are inquiring into the advantages of adopting machinery for their logging operations. In British Columbia logging by machinery has already become general, and the most modern methods are in use. This cannot be said, however, of Eastern Canada. Although the lumber industry in Canada had its beginnings in the East, it can be said of the manufacturers of Ontario, Quebec and the Maritime Provinces, that they have been very slow to take advantage of the benefits to be obtained from the use of logging machinery. Nor is it in one sense peculiar that this should be the case. Logging methods have been established by long custom in the East, and it is a difficult matter to persuade a man that the methods which have been giving satisfaction for a hundred years or more are in need of a change. The very antiquity of the logging methods of Eastern Canada, however, is the greatest barrier in the path of improvement. In newer districts, where the lumber industry is, comparatively speaking, of recent growth, those who have gone into it have naturally considered, first of all, the question of efficient and economic operation. They have been brought face to face with the problem of logging by machinery, and, not being influenced by the traditions of fathers and grandfathers who had been in the business before them, they have been more amenable to the arguments in favor of using machinery.

In Eastern Canada, however, of late, especially in Ontario, the larger operators have been looking into the machinery matter, with the result that to-day a number of them have adopted the use of machinery, and are securing encouraging results. One of the most enterprising firms in Ontario, the Cleveland-Sarnia Saw Mills Company, are using practically the same efficient machinery and railroading methods as are in use in the Southern States. They have a combined cableway, skidder and loader for handling their white pine timber up to 60 feet in length. This they are operating in very smooth country, which is especially suitable for such work. They have been using machinery, in fact, for their logging during the past five years, and report that they have been well satisfied with the results With the use of 20 men they are skidding and loading on an average of 30,000 feet of logs a day, averaging from 40 to 60 feet in length. Their main cable is 1,100 feet long, and cleans up on one line a space of 200 0feet by 1,100 feet. With one setting of the machine they can clean up an area of about 60 acres, or, in other words, they can log a circle with a diameter of 2,200 feet. They are using this skidder, of course, in connection with their railroad operations, and consider it one of the best propositions that a lumberman can use.

During the past six months much interest has been taken in other sections of the country in these methods, and several machines of various types are being introduced, mainly in the Province of Ontario. Among the companies introducing them are Eddy Bros. & Co., at Blind River, large operators from Bay City, Mich., who have used the cableway skidder to clean off the trees in rough mountainous localities, where the timber has been inaccessible in the past, thus saving a large amount of timber and greatly decreasing its cost. This company are, furthermore, considering the complete elimination of the use of horses in their woods, by hauling their sleighs by steam. They have already one machine for this work, and are performing other functions by steam, such as loading and unloading sleighs, building dams, etc.

Another company at Blind River, the Hope Lumber Company, have also installed a combined ground skidder and sleigh hoist. The White Pine Lumber Company, also, at Blind River, are using logging machinery on their limit back of Webbwood. They have two locomotives and twenty-five logging cars, all of standard gauge. They also have one steam logging loader, and expect to install a steam skidding machine during the coming season.

In connection with the use of logging machinery, the White Pine Lumber Company, in a letter to the "Canada Lumberman," say: "We have had very good success with our railroad so far, and expect to put in about ten million feet with it this coming summer, running one camp all season. We have had some trouble on account of the roughness of the country, but as yet have had nothing we could not negotiate, and more than keep our camps clear of logs.

"In the summer time we figure on building our railroad branches so as to have fair skidding distances between them and log right from the stump to the car without decking. In this way we keep our outfit working all summer, and have no idle horses eating their heads off. We have operated three years with a 15-ton locomotive, and this winter have taken in a 36-ton locomotive, which will enable us to negotiate steeper hills and sharper curves, which will be necessary in the new country we are opening up at the present time. We also have an alligator, with which we do all of our towing, as well as towing for other companies."

The White Pine Lumber Company estimate that they can log at least $2 per thousand feet cheaper with the machinery that they have installed than they could with horses.

The Serpent River Lumber Company, of Massey, Ont., have installed two cableway skidders on their limits, and intend in the future to conduct practically all their logging by steam. This company are exceptionally well favored to save money by the use of machinery,

because their ground is very rough and their timber is thick and of good quality.

J. R. Booth, of Ottawa, has recently been looking into this question closely, and expects to be able within a short time to adopt some of the devices for logging by machinery which are now on the market. In view of the varying character of the territory in which his lumbering is carried on, he is naturally giving the question the closest possible study before ordering machinery. In a recent interview with the "Canada Lumberman," Mr. Booth stated that to his mind the manufacturers of logging machinery had displayed great ingenuity in the design and construction of their machines. In view of the continually decreasing cost of labor, he said, it was well worth while looking into the economical advantages of the use of machinery for logging.

A prominent firm of manufacturers of logging engines and mill machinery, in a communication with the "Canada Lumberman," upon this subject, recently said:

"Handling logs in the woods by machinery is coming more and more into favor with the lumbermen every year. We know this from enquiries we have from time to time for our logging engines. When we first started building them we would only get one or two enquiries per month, but now we get as many as ten and twelve per day. There is not the slightest doubt but that in the very near future all lumbering operations, of any size, will be done with steam instead of horses.

"One of our engines will easily do the work of twenty teams (forty horses), and the first cost is greatly in favor of the engine. The engine sells for $6,000, and sleds for a large opeartion will cost about $4,000, or a total cost of $10,000. Horses, such as are used in the woods, would cost $500 per team, or $10,000, and then there are sleds and harness to buy and keep in repair.

"Now, as to the cost of operating. It takes a driver and teamtender, at least, with each team, or forty men in all, who have to be fed and kept, while three men are all that are required with the engine; an engineer, fireman, and man to steer. You will readily see the advantage of the engine in this one item of operating expenses alone.

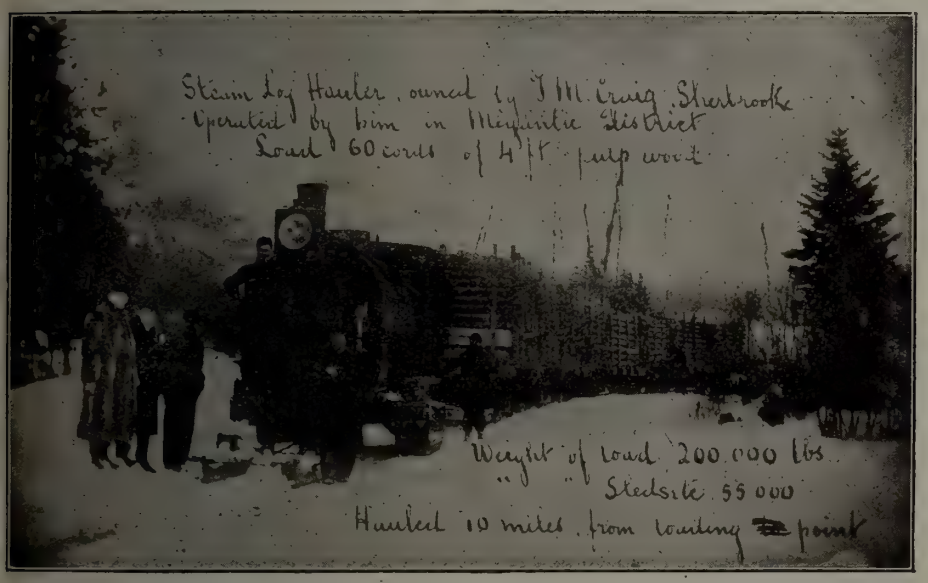
"Another great advantage with the engine is that when the operations stop, the expense also stops, while with horses it is not so. They have to be fed and taken out of the woods, and often kept with only enough work to give them exercise till the next year's lumbering starts.

"One party using our engine says that the cost of operating is as $45 is to $112 per twenty-four hours in favor of the engine."

With a view to presenting the case in favor of the use of logging machinery to readers of the "Canada Lumberman" as clearly as possible, a large number of inquiries have recently been made, both of the users of logging machinery and the manufacturers. The result is, as above shown, a convincing argument in favor of this development of the lumber industry. The following discussion of the subject is a compilation of the points which have been gathered as a result of the above inquiries.

The factors which have led to the increased cost of logging in Eastern Canada of recent years may be classified under three general heads: First, the poorer class of men going into the woods; second, the increased cost of supplies, and, third, the increased logging difficulties. In the past the class of men who entered the woods in the winter season were either from the farms, farmers' boys, or mill hands. They obtained good wages in the woods, and were well fed and healthy, and, until even the past six or eight years, it was easy to obtain good woods men. Recently there have been so many public works, railways, etc., constructed, on which high wages were paid, that the men have gone to this work very largely, and only the scum have gone to the woods. The old-time lumber jack has died off and gradually disappeared, so that the labor question now is a very serious one, and it is a difficult matter to get good men of the proper quality, and even to get enough men of any quality. From the Eastern Provinces a large number of the good men have gone to New England, and a similar migration has occurred throughout the whole of the country. It has been necessary for the lumbermen of the Georgian Bay region, for instance, to send to Toronto, Ottawa, Montreal, and even Quebec, for men. This entails considerable expense to the labor agent and to the railway. If they could figure simply on the expense of the absolute number of men they wanted, it would not be so bad. But suppose the agent sends a crew of fifty men. They run the risk of having the men desert at any town they come to. When they leave the train at the nearest point to the camp the men may be stolen by a neighboring operator. Again, men who have had their expenses paid frequently jump in order to avoid having to pay the transportation money back.

For such reasons as this, securing labor has become a very heavy item in the cost of labor. Where fifty men are needed, it may be that 250 must be secured. The question is, therefore, how can machinery affect this situation? It does not at first seem as though it could, but it can be of assistance in the case of the operator who works from



A Cableway Skidder Conveying Logs to the River

September 15th to March 15th, which is the rule in Eastern Canada, on account of the fact that they operate only so long as they can use cold weather, snow and ice. By using machinery, the operator can carry on his work throughout the entire year, every day of the year, if he wants to, because he has the power. He can log with machinery just as cheap, if not cheaper, in June as he can in January. So, instead of having a certain number of men for six months of the year, he can have one-half that number for twelve months. He can, under such circumstances, obtain a different class of men, as he is able to offer them steady work throughout the year. The man who has a family to consider is far more apt to look for a permanent position of this sort. Instead of having to send out for men every two or three months, the operator will therefore obtain a good class of permanent woods men. This has been shown to be the case in the Southern States, where machinery has been introduced practically everywhere, and where they even have schools, shower baths, Y.M.C.A.'s, and other public buildings right in the woods. Machinery, therefore, would indirectly affect the labor question by reducing the number of men required and rendering them more easy to secure eventually. Moreover, a man of that class would give a far better day's work.

The labor question is again influenced by machinery, from the fact that by its means work can be performed with the aid of a much smaller number of men. One-half, one-third, and even as low as one-fifth, the number of men can in certain cases, do the work with machinery. With the use of machinery, the young men are not only successful, but often make better workmen than the old-timers. They take hold more quickly and perform their operations better. So, instead of having to hunt for old lumber jacks, the youngest boys of the farms, cities, saw mills or machinery shops furnish the best labor.

The second influence in the increased cost of logging is the increase of the cost of supplies. Everyone knows that the cost of supplies

Steam Log Hauler Drawing Logs to the Mill or River

has increased greatly in the past few years. A smaller amount of labor will consume a smaller amount of supplies. This point is of still further importance, in that operations are always pushing back further from the base of supplies; that is, from the railways. It can easily be seen that if it costs a dollar per hundredweight to " tote " in supplies a distance of thirty miles into the woods, when you go back sixty miles the cost will more than double. This is of even more importance where horses are used, because the feed is a heavy item, and it becomes very expensive to feed horses when they are taken far back into the woods.

The third point to be considered is the increased scarcity of timber. This has an important effect upon the increased cost of logging. The more accessible timber having already been cut, the operations are pushing back, as above mentioned, and not only are they going further back, as a matter of actual distance, but they are going further back into the hills and mountains and into the inaccessible localities, and the conditions in every way are becoming more severe for the operator, as the " hauls " and the " drives " are becoming longer. Furthermore, the timber is becoming smaller, not only from the fact that they are going into localities where the timber grows smaller, but also from the fact that the increasing price received for the timber allows them to cut smaller trees and also to cut further up into the tree.

The usual way of handling logs in Eastern Canada is, of course, by horses, or, in some backward sections, by oxen. The cost of logging by steam. The trees are frequently brought to the mill in full length and are there cut into logs by power. They are skidded to the railways by power, loaded on the cars by power, hauled by power, unloaded by power, and conveyed into the mill by power.—(To be continued.)

with horses is increasing even more rapidly than the cost of supplies or of labor. A good team of logging horses to-day will cost in different sections of the country from $350 to $700, with perhaps an average of $475 during the past year. The question then arises, how can machinery decrease this cost? The present system of operating in Eastern Canada is mainly by winter logging and driving the logs to the mills on the stream in the spring. There are a few railroad operations, but they are so few in number in the Eastern Provinces that they may be left out of consideration. In general the operations are conducted, beginning at the latter part of the summer or the early part of the fall, and continuing throughout the winter months, so long as the cold weather lasts, the logs being piled upon the banks of the streams or the lakes, and by means of floatable water, increased by dams, sluices, etc., driven to the mills.

There has been from the earliest days practically no change in regard to the logging industry in general in the eastern provinces of Canada. Practically no improvements or radical changes have been introduced until the present decade. The lumberman of to-day is handling his logs in the woods practically in the same manner as did his grandfather. This is a statement which in itself, to any practical business man, should attract great attention, and make him realize that there is something radically wrong. It is practically the only industry of any size in regard to which such a statement would have any truth. There have, of course, been slight changes in the construction of sluices or improvements in the building of roads, dams, etc., and there have been changes in that horses are used instead of oxen, and the methods in a general way have increased in efficiency, but there has been no radical change such as all other industries have shown. Yet lumbering is one of the largest industries in the country. It handles a very bulky product, a product of great weight, and which, in comparison to its usefulness, weight and bulk, is exceedingly low in price. It would, therefore, seem that it is the one industry which should demand the most efficient power devices for its conduct, yet, as above stated, until the past ten or fifteen years there have been absolutely no improvements, and at the present day such improvements as are in use are very local in their application.

In contrast to this condition in the north, we have in the Southern and Western United States, and in other foreign countries, exactly opposite conditions. In fact, while the first logs in North America were hauled in Northern New England and Canada, and the logging industry has only within the past few years been introduced in some of the Southern States and Mexico, it is found that the most efficient operations in the woods are carried on in these new sections. All Canadian lumbermen are familiar with the invasion of the yellow pine into Canada a year or two ago, and know how their prices were completely upset and sale almost absolutely prevented by the introduction of this foreign product. The fact that this magnificent timber could be shipped thousands of miles and undersell lower grades at the place of production in Canada, was astounding, and it certainly should mean something to the Canadian producer. The reasons of this, of course, are several. The invasion was at a time when sales had to be made. Yet, at the same time, they were made at some profit. Stumpage is said to be cheaper there, and, as a matter of fact, yellow pine stumpage to-day can be bought from $2.50 to $4 per thousand feet, which is considerably less than the cost of well-situated Canadian timber. Milling costs approximately the same as in Canada. It would cost more from the point of view of the poor and highly paid labor which is used there, but that the mills are very modern and splendidly situated for cheap production There are additional costs, moreover, which are very important, such as the fact that dry kilns are necessary, and other special processes for handling the lumber because of the climatic conditions which prevail

The great difference, however, between the two regions is in the cost of logging. In the State of Louisiana, yellow pine during the past year has been cut, skidded and hauled to the mill, a distance of 30 miles, for less than $1.50 per thousand feet. This, of course, can be explained, in a measure, by the fact that the ground is smooth, devoid of underbrush, rocks and other difficulties, and that operations, therefore, are easily conducted. But we find, however, among other timber in the south, very nearly the same difficulties as exist in Canada. The almost impenetrable cypress swamps, where animals cannot be used for operations, and where men can hardly get around, are exploited at a most astoundingly low cost. While not quite as low as the cost for exploiting yellow pine, many of the cypress mills will cut, skid and haul their logs a distance of eight or ten miles to the mill for from $3 to $4 per thousand feet. Cheap labor has nothing to do with this, in that, while the ordinary negro labor is somewhat cheaper, ranging from $1 to $1.50 per day, it is less efficient than northern labor, and the necessary white labor is very much more expensive; so that probably the average labor costs in New England and Canada are considerably less than in the South. The main reason for the low cost of production in the woods of the south is the fine organization, equipment and power methods which are utilized. The only manual operations in the majority of cases in the southern exploitations of forests is in the felling of the trees. Every other operation is conducted

Round Timber Measurement Methods

Various Systems Used for Computing Contents of Logs - Some Complicated Formulae and Some that are Simple—Two Methods which are Practised

By A. H. D. Ross, M. A., M.F.

In a former article I pointed out how widely the best known of the log rules differ from one another, and how grossly inaccurate most of them are for the estimation of the board contents of the smaller logs. Attention was also drawn to some of the difficulties which stand in the way of adopting any one of the 54 rules now in existence as a standard of measurement throughout the Dominion; and the suggestion was made that the cubic foot unit of measurement should be adopted.

In estimating the amount of earth or other material in a cut, a fill or an excavation, we generally use the cubic yard unit because it is a definite and fixed quantity and everybody understands it. If we were to state the number of wagon loads, instead of the number of yards, we would at once be asked the size of the wagon box, how full it was, how closely the material in it was packed together, etc., etc. In a somewhat similar manner, when we estimate the number of "board feet" in a log of given dimensions much will depend upon what log rule we use, how it is applied, and the dimensions of the material sawn out. Even if we assume that the product is to consist of square-edged boards one inch in thickness, the estimated number of board feet in a log 16 feet long and with end diameters of 8 and 10 inches, lies anywhere between 16 and 49. This is about as unsatisfactory as to say that a given volume of earth will fill a wagon box anywhere from 16 to 49 times—the earth to be packed equally close in each case and the box to be filled to the same level. Then, again, as nearly all the log rules in existence are designed for inch lumber, they do not give any idea of the quantities of plank, deal, lath, etc., that may be sawn out. In the case of our sixteen-foot log, with diameters of 8 and 10 inches, it would be much more satisfactory to state that it has a volume of 7.16 vubic feet and let the buyer decide for himself what use he will make of it.

If, then, it is admitted that the cubic foot is a definite and understandable unit of measurement, it will be in order for us to make some inquiries regarding the simplest and most accurate methods of computing the volumes of logs of given dimensions. Quite a number of formulae have been developed for this purpose—some of them very simple, others quite complex; but fortunately they all agree to within about two per cent. of one another. In the case of square and waney timber, each stick is a frustrum of a pyramid, whose height and basal areas are known, and the volume can be determined readily enough. In the case of round timber the end sections may be considered as circles of given diameters, and a table giving the number of square feet in circles of these diameters enormously simplifies the work of computing their volumes. If the stick were a perfect cylinder its volume in cubic feet would be its length in feet multiplied by the number of square feet in either of the circular cross-sections. It so happens, however, that the basal areas are very seldom equal and that the surface lines, running from one end of the log to the other, are very rarely straight. These lines are, as a rule, slightly convex, and the form of the log approximates more or less closely to that of a frustrum of a paraboloid. If cut from a tree which has grown in a crowded stand it may be almost cylindrical; if from one which has grown in the open it may be nearly conical, or even approximate to the form of a neiloid. Hence it will be seen that formulae for the determination of its volume will depend upon those for the volumes of the frustra of paraboloids, cones and neiloids, or of solids which resemble them more or less closely.

We will say nothing whatever about the derivation of these formulae, but will endeavor to reduce them to as simple expressions as possible, and apply them to the case of a log 12 feet in length whose end diameters are 18.5 and 17 inches, for the purpose of comparing results. We will furthermore assume that the diameter of our log at 2 feet from the large end is 18.4 inches; at 3 feet, 18.3; at 4 feet, 18.2; at 6 feet, 17.9; at 8 feet, 17.6; at 9 feet, 17.5; and at 10 feet, 17.3 inches. These figures show that the surface lines are convex and that the taper increases towards the top of the log.

One of these formulae, which is much used in France, is known as the "Fifth Girth" formulae, and may be written: $V=2L(\frac{C}{5})^2$, where V is the volume in cubic feet, and L and C are its length and circumference in feet. With a middle diameter of 17.9 inches the circumference will be 4 11-16 feet. Hence a fifth of the circumference will be 15-16 feet, and the volume is $2\times12\times15\text{-}16\times15\text{-}16=21.098$ cubic feet. This estimate is higher than for the formulae which follow.

Newton's formulae is one of the most accurate, and applies to any sort of a frustrum, but necessitates the measurement of the length and three diameters. From tables giving the number of square feet in circles of given diameters we can find the "basal areas" of the cross sections of the log at its ends and middle point, and substitute these numbers in the formula $V=1\text{-}6\ L\ (B+4B_{1|2}+b)$. This gives a volume of $12\text{-}6(1.867+4\times1.747+1.576)=20.862$ cubic feet, or 1.1% less than that given by the Fifth Girth formula.

Schiffel gives the formula

$$V=\tfrac{1}{8}L(B+2B_{1/4}+2B_{1/2}+2B_{3/4}+b)$$

Applying this to the case of our 12-foot log, whose diameters are given at $\frac{1}{4}$, $\frac{1}{2}$ and $\frac{3}{4}$ its length, we get a volume of

$$^{12}/_{8}[1\ 867+2(1\ 826+1.747+1.676)+1.576]$$

=20.893 cubic feet.

Breyman's formula is

$$V=\tfrac{1}{8}L[B+3(B_{1/3}+B_{2/3})+b]$$

Applied to the above example, it gives a volume of 20.896 cubic feet.

Oetsel gives the formula

$$V=\ ^{1}/_{9}\ L(5B_{1/4}+3B_{3/4}+b)$$

which gives a volume of 20.955 cubic feet.

A still more complicated formula is that of Weddel, viz.:

$$V=\ ^{1}/_{20}L[B+B_{1/4}+B_{2/3}+5(B\tfrac{1}{6}+B\ ^{5}/_{6})+6B_{1/2}]$$

which works out to 20.838 cubic feet.

Simony's formula,

$$\tfrac{1}{3}L(2B_{1/4}-B_{1/2}+2B_{3/4})$$

gives a volume of 20.980 cubic feet.

Hossfeldt's formula is

$$V=\tfrac{1}{4}L(3B_{1/3}+b)$$

and gives a volume of 20.991 cubic feet.

Rudorf's formula is very complicated, but may be reduced to the form

$$V=0.1963L[(D+d)^2+\tfrac{2}{3}(D-d)^2]$$

where D and d are the end diameters of the log in feet. This gives a volume of 20:590 cubic feet.

Walter's formula is also a complicated one, but may be written

$$V=.1963L[(D+d)^2+(D-d)^2(\frac{D^2}{d^2}+\ ^{4}/_{5})]$$

It gives us a volume of 20.662 cubic feet.

The objection to most of the formulæ given so far is that they are too complicated for ordinary use, and necessitate a good deal of measuring. It will be observed, however, that they all give practically the same result. The question therefore arises: "Is there a single formula which will be sufficiently accurate for all practical purposes?" There are two such formulæ. One of these is Huber's, and may be written $V=L\,B_{1|2}$. In the above example, it gives our log a volume of $12x1.747=20.964$ cubic feet, which agrees very closely with the Newton, Schiffel, Breyman, Oetsel, Weddel, Simony and Hossfeldt formulae. The only objection to it is that it is sometimes inconvenient to get the diameter of a log at its middle point.

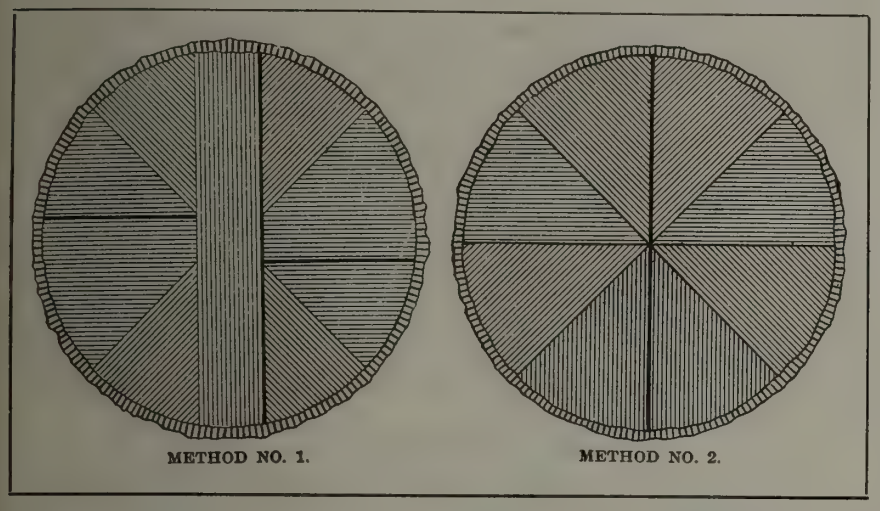
Smalian's formula is $V=\frac{1}{2}L\ (B+b)$, and in our example gives a volume of 20.658 cubic feet. This is 1.4% less than that given by Huber's formula. For logs less than 20 feet in length, Smalian's formula is sufficiently accurate for most practical purposes. All that it is necessary to know is the length of the log and its end diameters, and apply the formula, $V=\frac{1}{2}L(B+b)$, The values of B and b (in square feet) are then picked out from the table for the Areas of Circles, added together, and their sum multiplied by half the length of the log.

Where the middle diameter can be easily obtained, it is of course preferable to pick out the value of $B\frac{1}{2}$ in square feet, and multiply it by the length of the log in feet.

From this it will be seen that the number of cubic feet in a stick of round timber can be found quite accurately by applying the simplest kind of arithmetic to measurements of its length and diameters at properly-selected points. In the case of long sticks, like masts, spars, telephone poles, etc., the work is greatly simplified by chalking them off into ten-foot sections, measuring the diameters at the middle point of the sections, and applying Huber's formula. For example, if we assume that our stick is 56 feet long, that the mid-diameter if the five 10-foot sections are 17, 15, 14, 12 and 9 inches, and that the mid-diameter of the 6-foot section is 7 inches, then the stick contains

$$10(1.576+1.227+1.069+.785+.442)+6\times.267=50.99+1.602$$

$=52.592$ cubic feet.



In the above formulae the fractions coming after the letter B indicate the position in the log at which the basal area of a cross section is estimated. For instance, B½ means the basal area of a cross section in the middle of the log.

Methods of Quarter Sawing Oak

Plans Adopted by an Experienced Sawyer—Comparisons of Results Secured by Two Different Methods

There are scarcely two experts on the quarter-sawing of oak logs who will agree exactly as to the best methods of sawing. The head of one large oak-manufacturing institution has made repeated tests of various systems, and has repeatedly employed the methods illustrated in the two diagrams accompanying this article, says the Hardwood Record. In the method illustrated in Figure No. 1 the log is split one side of the heart, and the minor portion dropped onto the log deck. Four to seven or eight boards are then cut through the centre of the log; the half section is again split in halves, and the quarter thrown onto the deck. The remaining quarter is then sawn; then the half section is split and the same process ensues. Many advocates of this system contend that a larger amount of wide stock, and less waste results than by any other means.

In the second method, illustrated in Figure 2, the log is split

METHOD NO. 1. METHOD NO. 2.

absolutely in the centre and the half dropped onto the log deck and each half is sawn without removal from the carriage.

The gentleman referred to has made repeated tests of these two methods and his deduction is that method No. 2 affords the best net result in quality and economy of time in sawing. These results are indicated in the following tables and show very closely what has been achieved in scores of tests. It will be noted that the prices shown are lower than the present average values on quarter-sawed stock, but the comparison is just as valuable:

The following comparative statement of timber, measured and culled to date, is provided by the Supervisor of Cullers' Office, Quebec, under date of July 5:—

	Cubic ft. 1908.	Cubic ft. 1909.	Cubic ft. 1910.
Waney White Pine	551,160	583,000	236,240
White Pine	96,040	51,240	9,640
Red Pine	8,000	5,400	4,760
Oak	129,000	408,160	67,040
Elm	44,080	61,880	224,630
Ash	4,000	480	720
Birch and Maple	59,880	45,080	40,680

Important Development of Siemon Company

The Siemon Company, of Toronto, with capital of $1,000,000, which has recently been formed, is planning to develop the operations of Siemon Bros., Limited, of Wiarton, in such a manner a sto make them the most complete of their kind in Canada. They intend not only to continue and enlarge the operations at Wiarton, but to take over the plant of Geo. Niebergall & Son, of Parry Sound, where they will manufacture lumber and veneer. The plant will be considerably increased, and by this means the company will be enabled to use a great deal of the inferior lumber which would otherwise go to waste, for the manufacture of the cheaper grades of furniture. The Wiarton plant will also be increased considerably. At the Parry Sound plant a large patent veneer drier will be installed. This will be 100 feet long and will cost about $15,000. It will be ready for operation this fall. The company intend next year to build a new factory at Parry Sound for furniture and flooring. At Lakefield they recently secured a bonus of $15,000 from the town and will erect at that place next fall a furniture ad flooring factory. They have already secured a mill site and mill at Lakefield alongside of the canal. This was the property formerly of Lillicrap & Tate, both of whom will remain in the business. About $50,000 will be spent upon this plant. Mr. William Niebergall will continue as superintendent of the saw mill end of the business at Pary Sound.

The company have also been making arrangements to secure an extensive supply of lumber for their mills and factories. They have taken over limits at St. Joseph's Island amounting to 5,000 acres, of which 3,051 is freehold. They own also on St. Joseph's Island a town site at Milford Haven, which has an excellent harbor with large up-to-date mill capable of cutting 40,000 feet hardwood per day, and they have a mill also at Mud Lake. They are taking over also a tract of 60,000 acres of hardwood on the north shore which is held under one of the old Government leases, and which contains large quantities of maple and birch of excellent quality, and also considerable amount of young pine, which will be allowed to grow for some years before cutting. These arrangements will provide the company with sufficient timber to last them for many years to come, making their business complete in every way and enabling them to handle all their lumber from the stump to the finished product. They have in mind also plans for the utiliation of several of their bi-products, at Wiarton in the manufacture of various lines of small specialties. This plan will be worked out in the near future.

In connection with all these developments, Siemon Bros., of Wiarton, will be continued under their former name and their capital has been increased from $100,000 to $300,000. The company have found their export trade increasing so rapidly of late that they have been obliged to make these arrangements in order to keep up with the trade. They are going in extensively for export business, and are already shipping large quantities of their products to Great Britain and South Africa. By means of their enlarged capacity they will now be able to develop their export business considerably.

The Retail Dealer and His Problems

Storing Finished Lumber—The Manufacturer and his Customers

Storing Lumber and Handling Shavings

By James F. Hobart

I recently watched the erection of a small shed for the storage of finished lumber. The method of construction, manner of laying out, and the general arrangement of the whole business appeal so strongly to me that they are given here for the use of anyone who may be interested in a similar proposition. The structure, as shown by Fig. 1, is of balloon frame construction, about 72 feet long, 20 feet wide and has a height of 20 feet, divided into two 10-foot stories. The lower story, as shown by the halftone, is open along its entire length, on one side.

The building is on the west side of a street, running north and south, therefore the building is open to the west, and " the front of

Fig. 1—General View of Lumber Shed

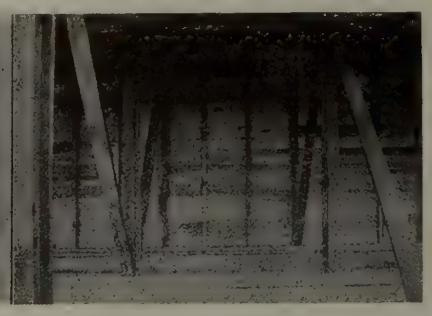

Fig. 2—Arrangements of Interior Framing

the building is on the back side, and the back or rear of the structure faces the street."

The Storage Structure

The storage building is divided into bents of about 6 feet each, giving twelve spaces for piling material, each 6 by 10 by 20 feet deep. The foundation of the building is monolithic concrete and it was deposited in a trench, or trenches, along the 72-foot way of the building, and across each end. Five trenches were made, 5 feet apart. They were 12 inches deep. Plank molds or forms were used to keep the concrete in shape during the placing of that material. The plank forms were carefully leveled and the concrete smoothed off level with the upper edges so that a fairly level surface was obtained upon all of the lines of concrete.

The sills which were placed upon these concrete foundations were made of 2-inch plank, 8 inches wide, and each line of plank extended the entire length of the 72 feet and was anchored to the concrete by bolts spaced every 5 or 6 feet. Fig 3 show sthe manner in which the foundation and sill arrangement was made. The bolts, one of which is shown at A, were ½ inch diameter and 4 inches long. They were placed after the concrete had been deposited in the forms. Each bolt

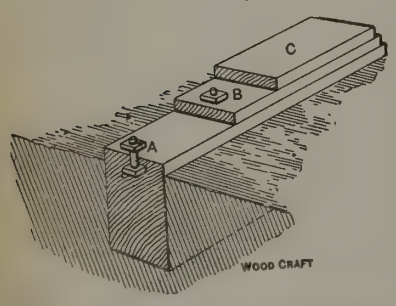

Fig. 3—Foundation and Sill Arrangement

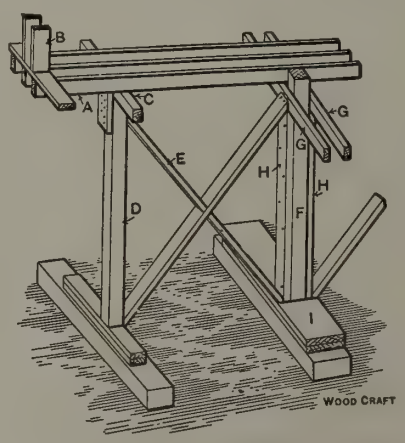

Fig. 4—Details of Interior Framing

was pushed down about 1½ inches and the concrete smoothed off and packed closely around each bolt.

The lower layer of plank B was bored to receive the bolts which were pushed through the holes and then the nuts were screwed home and cut into the second layer of plank C which was then spiked to the first layer and care taken to break joints in all cases. The top layer of plank was thus made smooth and free from all bolt heads or nuts. The anchor bolts were put in to keep the several lines of sills in place under the impact of pieces of lumber, however vigorously the latter may be piled by the laborers.

The sills also formed the bearings upon which the lumber was piled. Thus there are four sills for lumber piling, the rear sill not being available for this purpose except when the lumber is exceptionally long. By means of this arrangement of sills, there is no danger of any of the piling bearings ever getting out of place. As the concrete is raised a few inches above the surface of the ground, there will never be any danger of flooding the stock even during heavy summer showers or winter thaws.

Overhang of Shed

It will be noted, by referring to Fig. 1, that the front of the building overhangs several feet—about five or six—and this shelter permits lumber to be piled in the lower story without any danger of its getting wet. The convenience of the overhanging shed, during rainy weather, needs no advertising. But the great value of the overhang is in the fact that it keeps rain off the ends of the lumber piles, something which the ordinary open shed does not do.

The method of arranging the interior framing of the shed, together with the placing of the concrete foundations and the diagonal braces, are plainly shown by Fig. 2, in which two of the sills and the bracing are visible. By this method of bracing, short lumber may be piled, without the danger of its falling down between the posts which are supposed to hold it in place.

The manner in which the interior framing is put together is shown in detail in Fig. 3. It will be seen that the overhang of the building, a distance of five to six feet, is carried entirely by the second-story floor joists. At first sight this seems to be a very poor arrangement, but a little study of the overhang, as shown at A, makes it at once apparent that not only is the second-story amply supported but that there is no need for much support under the overhanging portion of the building. This matter may be figured as follows. The overhang A which extends from B to C can never be heavily loaded, therefore, it will never require very strong support.

Simple and Direct Frame

As shown by Fig. 3, there are two sliding doors in the upper portion of the structure and this makes it necessary that an alley or passageway be kept clear at all times along the front side of the building. This means that the support C must carry all the load in the front portion of the building and as no load can come upon the overhang, consequently there is no need of any heavy timbering to support this portion of the structure.

The simplicity and directness of the framing in this building appeal very strongly to the designing engineer. It is evident that the building was planned by someone who was thoroughly conversant with the needs of storage structures and the limitations of balloon framing and its very light material. The load is carried direct by the line of posts, one of which is shown at D, and the beam or plate C is held in position by both the patch ledger and the diagonal bracing E.

Directness is also shown at post F where the load is carried by the beams G which are spiked to post F, and still further directly supported by the pair of scantlings H, which in turn are spiked to post F. The sill I is made wide enough to receive both the post F and scantlings H and also the diagonal bracing E. These are all toenailed or spiked to the posts and to the sills and to the scantlings. The latter, with the posts, form the racks or sides of the spaces in and against which the lumber is piled. By means of this arrangement, short lumber, down to three or four feet long, is easily held in place when carefully piled, one of the posts or braces being almost sure to engage any piece of lumber of the length stated.

Lights and Landing

Referring again to Fig. 1, it will be noted that there is an outside stairway leading to the upper story. The landing or platform at the head of the stairs is formed by extending outward the timber C, Fig. 4, together with the plate A and the ledgers G. This makes a very solid landing and posts are unnecessary. The upper story of the storage building is served by two large sliding doors which are plainly visible in Fig. 1, and as may be seen in the same engraving the lighting is by means of single sash windows placed high up from the floor. Only windows enough are provided to give light for piling stuff and for getting around in the building when the large sliding doors are closed. High up windows in a storage shed are pretty good preventatives of dampness to stored dry lumber.

Electric Drives

The structure was designed and erected for use in the ordinary run of business. The company have also recently added a new jobbing shop, driven by electrical motors, which take current from high-pressure mains, a bank of transformers just outside the new shop serving to reduce the 14,000 street railway current to a voltage which can be handled by the shop motors. Current is supplied by a hydroelectric

station several miles distant. It comes to town at 25,000 volts, is transformed down to 14,000 volts to supply the street railway sub-stations and, incidentally, any local concerns which are fortunate enough to acquire a right to use the water-power current.

The running of the shop by electric motor left a problem for solution in regard to the quantities of shavings and sawdust made in the shop. The absence of the usual boiler, for steam generating purposes, left the disposal of the shavings an unsolved problem and it was finally decided to put in an exhaust fan and a system of piping from each and every machine. This was done in the usual way, but the main pipe leading from the fan was carried out of the shop through the pitch of the roof about 25 feet from the ground, a dust collector was installed at that level and the shavings discharged into it and thence to a dust bin of sufficient capacity to run the shop for several days without being emptied.

Disposal of Sawdust

This bin possessed all the novelty there was in this arrangement. It was located at a height above the ground which permitted a team attached to a large box wagon to be driven underneath the storage room. Means were provided to chute the shavings into the box wagon which was then driven to a nearby boiler-house and the contents discharged, to be consumed under that steam generator. A deal was made with the owner of the boiler and the wood-shop manager was enabled to dispose of the shavings and sawdust made in his shop at a figure which more than paid for the teaming and the interest on the overhead storage bin.

Handling the Waste

In many localities it used to be the custom to discharge the waste into a " hell " wherein the refuse was consumed. It must be pretty far in the backwoods, nowadays, when this form of disposal will pay or even be tolerated. Wood is worth too much to be disposed of in this manner and some kind of a market can always be found for the waste, even though it is only to the livery stable men for bedding to their horses.—Woodcraft.

Deceptions by the Buyer

By Alex Lendrum

This is a subject which may be construed from many angles, but it is not my intention to make an attack on any buyer personally or reflect on the buyers of veneers generally. I regret that there are some buyers in the country who are attempting to, and in some cases are, taking advantage of the manufacturer of veneers, and my remarks are confined exclusively to this class of buyers. I would divide the deceptive buyer into two classes: First, the buyer who attempts to deceive the manufacturer by misrepresenting quotations or prices which he may or may not have received; second, the buyer who attempts so to manipulate his specifications as to force the manufacturer to quote on, or furnish a proportion of sizes which it is impossible for even the best grade of logs to produce or to consume the product of the log.

As to the buyer who misrepresents quotations and prices he had received, it might well be argued that this is a proposition which must be met by the individual salesman or the sales department, and until such time as the manufacturers of veneer realize that they are being worked by this class of buyers this condition will continue. We all know how often when we make quotations on a specification of veneers that if our quotation is $10 a thousand feet the buyer will advise that it is probably the highest quotation he has received, and he is offered from many sources the same stock by reliable concerns at $8. I regret that there are some manufacturers that as soon as this occurs figure to themselves that if Jones can produce this bill of veneer profitably at $8 they can do likewise. This practically permits the buyer to make the price upon the manufacturer's product, and as long as the buyer is permitted to make this price, the manufacturer can not receive a profitable figure for his stock.

As to the second class of buyers, who, through manipulation of their specifications try to secure stock in greater proportion than the logs will produce, this is a condition which the manufacturer is actually responsible for. I refer particularly to the buyers of 1/8-inch door stock. We are all fully aware that, regardless of how good the quality of logs may be in birch, ash, gum or oak, only a certain amount of stiles and panel stock can be secured from the logs and that the amount of small stock in rails and panels from the log must necessarily be taken care of, or it will in a short time result in the manufacturer having his warehouse piled full of little stock. For instance, we divide door specifications into classes; that is, 1, 2, 3, 4, 5 and 6 panel doors, and from the average run of logs which are available (and this I think applies to almost every locality) the product of the log will just about be consumed on a 5- and 6-panel door. If we quote the buyer on a 5-panel door complete, that is, four stiles, ten cross rails, ten panels and two bottom rails at a given price, and 2-panel doors, consisting of four stiles, four cross rails, four panels and two bottom rails, at a proportionately higher price, then we must secure this exact proportion to take care of the product of our log, and the price on the 2-panel door must be proportionately higher to take care of the waste of cutting over the 5-panel door.

Further, where buyers wish to secure stiles or panels in excess of proportions required in these respective doors, the manufacturer must then secure a price that will permit him to produce the stock. For the last few months a great many specifications have been sent broadcast over the country for door stock in which would be combined a certain percentage of 5- and 6-panel and a percentage of 1- and 2-panel doors, and unless the manufacturer will carefully figure out these specifications and figure the proper proportion of stiles that would be admitted in each size, likewise the panels, it is a very difficult proposition upon which to make an intelligent quotation, and evidently from some of the quotations which have been sent out by the manufacturers this careful analysis of the specifications has been overlooked. We received recently an inquiry with specifications for approximately 400,000 feet of 1/8-inch door stock which purported to be several different sizes of 5-panel doors. By a careful checking up of the proportions of the sizes in this specification we discovered that there was an excess of stiles of almost 60,000 feet, so that this particular buyer had attempted to secure from the manufacturer this great excess of stiles in the price of a 5-panel door; this, probably for the reason that he was able to buy from some other manufacturer a large amount of accumulated small sizes at a very low price, and then hoped to work in his next regular specifications a sufficient excess of stiles to work with the small cheap stock. I do not attach any blame to the buyer for attempting to buy this stock in this manner, but I do attach blame to the manufacturer who is willing to have such a deal put over on him.

I have referred in this matter almost exclusively to the subject of door stock, because that is our principal business and the only one with which we are fully familiar, and I have no doubt but what it applies equally to all other woods and other specifications. I have overlooked, but by no means forgotten, the buyer who after he secures your stock makes all sorts of claims and complaints as to grade, shortage of feet, etc. This really is the worst condition with which the manufacturer has to deal, because after you have shipped your stock and it is in the possession of the other fellow he makes such a complaint that it is an exceedingly difficult matter to handle. Fortunately for the veneer manufacturer these buyers are few, and they will become fewer by close affiliation of the manufacturers in giving their experiences as to the methods of various buyers.

I have in mind still another buyer who puts before the manufacturer his specifications for veneer and asks for quotation on sample shipment, and would lead the manufacturer to believe that he is a very large buyer of veneer, which he specifies. Frequently he may be a small consumer, requiring only 10,000, 20,000 or 30,000 feet for his season's consumption, yet he will state that if the quality, etc., is satisfactory it will lead to large future business. On receipt of your quotation, based on prices f. o. b. plant or freight allowed in carload lots, he will then attempt to get the manufacturer to deliver this sample shipment in less than carload, that he may see the quality, etc. A great many manufacturers have made this concession, which in many cases is a very large one, and then found that six months or perhaps a year would pass before the buyer would again be in the market.

There is yet another class of buyers who are quite necessary to the trade, but at the same time one of the most difficult problems which the veneer manufacturers have to contend with. I refer to the commission men and jobbers. Naturally the commission man's main effort is to make sales and to obtain his commission by any means he sees fit —his existence depending on his commissions. He will consequently make sales at any hazard, all his efforts being to please and stand in with the buyer, very often to the disadvantage of the manufacturer. In a great many cases he will secure tentative orders from the buyer and then manipulate these options among the manufacturers, often making the manufacturer believe that he is getting the best price obtainable, and then is probably agreeing to deliver the goods at less price than his competitors would take for the order. The commission man succeeds in making the sale, breaking the market price for the stock, thereby sending the manufacturers tumbling over themselves to cut prices to secure the next order. Frequently the commission man will visit the manufacturers with a tale of woe that Jones and Brown are quoting stock at a less price than any manufacturer can profitably produce the stock. The result often is that the manufacturer may authorize this commission man to place his goods at that price, or a little lower and possibly gives extra dating to secure the business. The commission man will often make representations to the buyer as to the grade of goods and will take orders for a class of stock that can not be produced by the manufacturer. He will then represent to the manufacturer that the buyer is not particular as to the grade or quality, and even though the price is low the manufacturer will obtain better results than if he had sold to the buyer who paid the market price and required actually the grade of stock he was buying. I do not believe there is anything so disastrous to the manufacturer as to make a connection or fall into the hands of an unscrupulous commission man,

Lumber News of Western Canada

Outline of Properties of Canadian Western Lumber Coy. —Output of B.C. Coast—Big River Company's New Plant

The share capital of the Canadian Western Lumber Company, Limited, under which name the Fraser River Lumber Company, of New Westminster, B. C., has been reorganized, amounts to $10,000,000, of which $2,500,000 is 6 per cent. cumulative preferred stock and $7,500,000 common stock issued and fully paid up The recent issue which was floated in England by Mr. W. Mackenzie, President of the Canadian Northern Railway, was £1,500,000, 5 per cent. first mortgage debenture stock at 88, repayable in 35 years at par, or sooner, by means of sinking fund.

In the prospectus recently issued by the company its assets are estimated as follows:

5,500,000,000 feet of timber at $7.50 per 1,000 ft.	$41,250.000
75,000 acres of land at $15 an acre	1,125,000
Estimated value of lumber, logs and merchandise on hand	1,020,000
Saw mill, planing mill, dry kilns, tramway, docks, railway equipment, stores, warehouses, dwelling houses and town site of 425 acres	2,500,000
	$45 895,000

The prospectus states that the company was formed to acquire certain blocks of freehold land, aggregating about 75,000 acres, upon which is a valuable body of timber, and also a number of valuable timber leases and licenses upon 60,460 acres partly granted by the Dominion and partly by the Province. The company's land and timber is in easily accessible blocks, mostly in the Comox district, the larger portion lying in the valley of the Tsolum and Oyster rivers and their tributaries. The total cut has been estimated at 5,500,000,000 feet of good merchantable timber, about 75 per cent. of which is on the company's freehold land. The principal growth is fir, which, according to the prospectus, scales from 3,000 to 15,000 feet of lumber per tree. The trees are said to run to a good percentage of No. 1 logs. The situation of the land is such that when the timber is cut most of it is expected to become readily saleable for agricultural purposes The prospectus states further that the company expect to derive a profit of $7.50 per thousand feet upon the timber after allowing for all expenses, and that the land will realize an average of $15 per acre

When the establishment of a plant now in course of erection in the Comox district is complete the Canadian Western Lumber Company, with which Messrs. Mackenzie & Man, of the Canadian Northern Railway system, are principally identified, will have the largest logging outfit on the Pacific Coast. The plant will be ready by October 1st, when 500,000 feet will be shipped daily to the Fraser River mill of the company, situated some two miles above New Westminster. Twenty-one miles of logging railroad running from Comox Harbor to berth 29 on the Tsolum River is now being constructed. Steam skidders are being installed, and the water power of Wolf Lake is being developed to supply the logging camp with electricity, a feature which will make it unique among logging camps in the province.

Mr. R. H. Campbell, Dominion Superintendent of the Forestry Branch of the Department of the Interior, recently visited the eastern slope of the Rocky Mountains where the Dominion Government intends to establish a huge forest reserve. Speaking of the district Mr. Campbell said: "The timber in this reserve is to be used. It is for the purpose of providing an area which will be given over entirely to the production of timber that the reserve is being established. No settlement will be allowed in the reserve. The placing of this great area on a basis that will be permanent will allow of a complete organization for the protection of the timber from fire. Another purpose to be served by the reserve will be the protection of the watersheds. All the small streams which have their sources in the Rockies are dependent on the preservation of the surrounding timber. Once the mountains are denuded of their timber there will be no small streams which provide water for the prairie country below.

The Big River Lumber Company, Big River, Sask., of which Mr. Wm. Cowan is the President, are progressing rapidly with the construction of their new mill. The mill will be one of the largest in the world, having a capacity of 500,000 feet a day. The company have purchased a planing mill outfit from the Berlin Machine works, consisting of some twenty machines, including a number of Berlin 94x fast feed planers and matchers and some of their latest No. 90 fast feed planers and matchers with profiling attachment. The machinery is to be shipped by September 1st and installed immediately. The machines will all be provided with a direct motor drive, each having an individual motor. Filer & Stowell, Milwaukee, have the contract for the sawmill outfit. The Canadian Crocker-Wheeler Company, St. Catherines, Ont., are supplying the motors, which consist of two 75 h.p., eleven 50 h.p., one 35 h.p., one 25 h.p., six 20 h.p., two 10 h.p., and four 5 h.p. motors. The product of the mill will include flooring, ceiling, shiplap, car siding, dimension stock and timber.

Pacific Coast Daily Output

The following estimate shows the daily cut of the principal mills in the Vancouver, Victoria and Fraser River Districts:

Name.	Feet.
VANCOUVER DISTRICT.	
North Pacific Lumber Co. (This plant is being rebuilt and will be in operation about September 1st.)	175,000
Canadian Pacific Lumber Co.	100,000
Burrard Lumber Co.	25,000
Heaps & Co.	50,000
Anglo-American Lumber Co.	60,000
Hastings Shingle Co.	50,000
B. C. L. & T. Co.	230,000
Pacific Coast Lumber Co.	85,000
Red Cedar Lumber Co. (2 mills)	60,000
Rat Portage Lumber Co.	60,000
False Creek Lumber Co.	40,000
Vancouver Lumber Co.	125,000
Stewart Lumber Co.	25,000
Patterson Lumber Co.	40,000
Emerson Lumber Co.	40,000
VICTORIA DISTRICT.	
Michigan-Puget Sound Lumber Co., Victoria	90,000
Lemon & Gunnason, Victoria	30,000
Leigh & Sons, Victoria	25,000
Chemainus.	
Victoria Lumber & Manufacturing Co.	100,000
Sydney.	
Sannich Lumber Co.	40,000
Cowichan.	
International Lumber Co. (not operating)	50,000
Nanaimo.	
Red Fir Lumber Co.	40,000
FRASER RIVER DISTRICT.	
Canadian Western Lumber Co., Fraser Mills	350,000
Brunette Sawmills, Sapperton	80,000
Small & Bucklin, New Westminster	60,000
Delta Lumber Co., Ladners	25,000
Royal City Mills, New Westminster	80,000
Harrison.	
Harrison Lake Lumber Co.	75,000

In this estimate no effort has been made to figure the cedar logs utilized in the manufacture of shingles.

Miscellaneous News from the West

Sixty-nine million feet of logs were measured by the British Columbia scalers during May. This is a record, exceeding the best previous total by seventeen million feet. At nine dollars per thousand this output is worth $621,000.

Because of the slack condition of the market, shingle manufacturers of British Columbia decided to close down on July 1st for an indefinite period. The effect of this cessation of operations will mean a large decrease in the production.

In the Saskatchewan Lumber Company's mill at Crooked River recently, with one circular saw and one 8-inch horizontal band resaw and one man edging, the record cut of 104,008 feet of spruce lumber in ten hours was made. The lumber was cut into one inch and two inch.

The mills at Edmonton, cut during the past winter, ten million feet of logs, an increase over that of the winter previous, conditions having been very favorable. With the burning of the mill of the Edmonton Lumber Company, a short time ago, the output of that district will be curtailed and there is likelihood of a shortage of lumber.

A Vancouver committee, assisted by Rev. Alf. Hall, of Toronto, has commenced a campaign to raise one hundred thousand dollars for the new Strathcona Sailors' and Loggers' Institute. Negotiations for amalgamating all the seamen's interests into one movement were successful. An anonymous donor starts the fund with ten thousand dollars.

The cracking of a saw at the collar line is unusual, but may possibly arise from the saw not being up to its proper speed when in the cut and the feed of the timber being too fast for it, causing it to run out and wedge the timber against the fence, thus creating considerable lateral pressure. If the speed of the saw is reduced from any cause the speed of the feed should at once be reduced in proportion. Body [illegible] also caused by improper tension of the saw plate, forcing dull saws, etc. Care must be taken that the saw has a sufficient number of teeth in proportion to the rate of feed.

A saw will heat at the centre from a variety of causes, such as (1) bearings not in good order; (2) saw too "open" in the body for the speed; (3) speed too slow to properly expand the rim; (4) teeth with insufficient set; (5) saw improperly lined as regards the log; (6) improper packing.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A Heavy Band Rip Saw

The accompanying illustration shows J. A. Fay & Egan Co's. largest band rip saw, which has a capacity for material 28 in. wide and 14 in. thick. The machine is adapted to reducing large timbers to those of smaller dimensions, ripping wide lumber into strips of varying widths, resawing from the side of timber, etc As shown by the illustration, the column is very heavy, cored, and it is free from vibration.

The most important feature on this machine is the manufacturer's patent knife-edge straining device, which enables their No. 109 to run a very thin blade at a great speed without danger of buckling or breaking. The feed is very powerful, consisting of five 8 in. rolls. There are three driven feed rolls in the table. The upper rolls are

J. A. Fay & Egan Coy's Largest Band Rip Saw

adjustable up and down instantly, and may be raised from the board stopping the feed, or lifted quickly out of the way for use as a hand feed rip saw by a single movement of a long lever conveniently located for the operator. For further particulars readers should write to the manufacturers for their large illustrated circular. The proper address of the company is 465-485 W. Front St., Cincinnati, Ohio.

Another Emery Wheel Factory for Canada

Arrangements have recently been made for establishing a factory for the manufacture of grinding wheels in New Toronto. The company is composed of Mr. J. R. Baxter, of Montreal, President; Mr. A. T. McCutcheon, of Springfield, Ohio, Vice-President, with Mr. E. W. Sawyer, formerly factory superintendent for the Safety Emery Wheel Company, of Springfield, Ohio, as General Manager. Mr. Sawyer has been with the Safety Emery Wheel Company for the last seventeen years, his expert practical knowledge having been an important factor in its success. It is his intention to turn out in Canada the same high grade of wheels as manufactured by the Safety Emery Wheel Company. The Dominion Abrasive Wheel Company, Limited, will make a feature of wheels for sharpening saws, planer knives, etc., and claim that they have a wheel for this purpose which will grind rapidly without burning the tool. They already have factory arrangements well advanced and anticipate commencing to manufacture almost immediately. We understand they have appointed Messrs. J. R. Baxter & Co., of Montreal, as their representatives for the Province of Quebec.

An Improvement in Wire Cloth Screens

While wire cloth has the advantage over perforated metal for sieving purposes, in many cases the rough or uneven surface of the former has been a great disadvantage. This has been overcome by passing the cloth between heavy rolls to flatten the crowns of the wire. The B. Greening Wire Company, Limited, of Hamilton, Ont., have always done more or less of this work, and lately, finding the demand for same largely increased, they installed rolls to take care of the demand for medium weight screens. This proved such a success that the firm was encouraged to put in heavier rolls. These rolls are now installed, and are claimed to be the heaviest rolls to be found in any wire cloth plant on the continent. The installation of these rolls marks the completion of a wire weaving plant that the company assert is equal to that of any concern in the world making the same class of work.

An Attractive Huther Catalogue

Huther Saws are interestingly and attractively described in a new catalogue issued by the Huther Bros. Saw Manufacturing Company, Inc., of 1190 University Ave., Rochester, N.Y. The catalogue, which is attractively bound in a red paper cover, contains a generous amount of illustration, showing the various band, circular and special grooving saws, for which the Huther Company have become so well known, and a number of excellent illustrations are also included to accompany the descriptions of the company's special saws for the cooperage trade. The catalogue also contains descriptions and illustrations of the saw fitting machinery produced by Huther Bros. Sawmill men and all who are in any way interested in the use of saws will do well to write to the company for a copy of the catalogue

128,350 Laths in Ten Hours

The C. Beck Lumber Manufacturing Company, of Penetang, Ont., on a trial cut recently, made 128,350 4 ft. laths 1½ in. x ⅜ in., in ten hours, counted, tied and piled. The lath mill foreman was Mr. Dan McMillan and the mill foreman, Mr. Fred Peacock. This enormous cut was made on one of P. Payette's No. 1 four saw bolters and No. 2 five saw lath mills. The lath mill crew and the maker of the lath mill and bolter deserve special commendation, as this, the company claim, is the largest output of laths that have ever been manufactured in ten hours cutting.

The market for spruce deals in Great Britain is dealt with by the Timber Trades Journal in a recent issue as follows: "There is no change to report in the c.i.f. market for these goods, values remaining unchanged but firm. The few liner parcels which have arrived since our last report have been placed at rather better prices than those previously ruling. With regard to the spot market, this is not in altogether such a satisfactory condition. The demand is by no means so good as anticipated; expectations for a ready sale of early cargoes have not been fulfilled and consequently there has been perhaps more cutting than usual to obtain orders. Probably the importers would rather dispose of these early arrivals at cost, and get their profit on later deliveries, than yard them right at the commencement of the import season. Whatever the cause, it appears to us, if the reports we hear are true—and we have no reason to doubt them—that the majority of sales of decent lines ex quay have been made at prices which, if not actual cost, do not show a working margin of profit. The state of things cannot last all through the season, and values will be regulated more than ever by the law of demand. The chief wood which competes with spruce on the West Coast is, as is well known, Riga and kindred white deals, and as these are exceptionally firm, there is nothing to fear from that quarter. Further, as c.i.f. values at present are firm, the market will require very careful watching, for if the demand does not improve very considerably, we shall not be at all surprised to see spruce easier later on; but if the demand even becomes normal we cannot see any justification for predicting a falling off in values.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

A Pulpwood Klondyke

THE PICK OF THE FINEST VIRGIN timber lands in Labrador and Newfoundland. Advantages on Labrador over other territories: no cutting tax, no royalty, no export duty, pulp making and lumbering free of restriction, limitless water powers. We control valuable timber properties on Labrador and Newfoundland, and are prepared to give prospective purchasers all information regarding same. For further particulars apply to JOB BROTHERS & CO., LIMITED, St. John's, N. F. 23

Timber Limits For Sale

NINE SQUARE MILES ON CHERRY Creek and North Fork of Spallumcheen river Osogoos division, Yale district, British Columbia, about 50 miles East of Vernon and 20 miles west of Upper Arrow Lake.

These limits are comprised of bottom lands and benches of hills and contain about 100 million feet of the finest of Cedar, with a fair proportion of Hemlock, White Pine and Fir and are very conveniently situated for logging, with easy slopes toward streams. This is one of the most desirable properties in the Yale district and is steadily increasing in value. For further information address, BEATY TIMBER COMPANY, 4 Wellington St., East, Toronto. 14

Mississipi and Arkansas each supplied more than one-fifth of the cottonwood lumber output in 1908, and Louisiana about one-eighth. Over one-half of the total production, 232,475,000 feet B. M., was reported by these three states.

Persons contemplating the manufacture of excelsior should know that it is essential to have perfectly dry stock for the machines to do the work, and the straighter the grain of the wood the better the grade of the product. The timber should be split up into bolts and stacked at least one year before being cut into excelsior. Second growth white poplar makes good stock and meets with a ready sale.

American Ash.

Ash is widely distributed throughout the eastern half of the United States, and no state or group of states distinctly leads in its production. The output, 225,367,000 feet B. M., for 1908 was a decrease of nearly 27,000,000 feet, or 10.6 per cent., from the cut in 1907. Michigan and Arkansas each furnished 9.4 per cent. of the total, and Ohio and Indiana almost as much; slightly more than 8 per cent was cut in Wisconsin, and nearly 7 per cent. each in Tennessee and New York. The total cut in 1900 was 269,120,000 feet, or 43,753,000 feet more than the cut in 1908. Of this production in 1900, however, Michigan supplied 85,753,000 feet, or more than four times as much as was cut in that state in 1908.

Mahogany in Mexico.

The sources of supply of all varieties of Mexican mahogany are fast being depleted. All the streams from the port of Tuxtan south to Progreso, down which mahogany and cedar logs can be floated, have been stripped of merchantable timber of these species. Even as far back as Oaxaca, the old mahogany and cedar stumps, standing at a considerable distance from the river, indicate how thoroughly the merchantable supply has been exploited; while farther back from these streams there still are numerous individual trees, the cost of transporting them to the only means by which they can be got to market, namely, water courses, prohibiting their being cut. Most of the claims made by the land agents, that the mahogany and cedar on their lands are in themselves worth the price they ask for the land. are usually not based on facts.

Nevertheless, a considerable number of mahogany and cedar logs are floated down the Usumacinta River in Tabasco, and the port of Laguna, in Campeche, also ships a lot of these species, in addition to the dye woods. Contrary to the popular belief, nearly all the mahogany and cedar in Campeche even has been cut and hauled to the limit of the merchantable stand. The same condition prevails along the streams in this state as in the other states previously mentioned; and only when more modern methods of logging have been introduced and old methods of hauling by mules and oxen done away with, will it be commercially profitable to log any further inland.

Back from the coast, along the railroad lines, there are, however, large bodies of mahogany, cedar, and other valuale hardwoods close enough to the tracks to be economically handled.

Beginning at Yucatan and extending 300 miles in a line northeast and south-west, with an average width of 100 miles, there is an area of about 35,000 square miles of as good a growth of mahogany cedar, and mixed hardwoods as can be found in any locality. This tract commences at Yucatan and extends into Campeche, reaching over the Tabasco nearly to the Usumacinta River, and almost half of it lies in Guatemala. The stand on this area is of exceptional quality, and there are probably very few mahogany and cedar forests covering so extensive an acreage. Patches have been encountered where trees stretch for a mile, with practically nothing but mahogany. The old methods of handling these woods are not only wasteful, but are prohibitive of exploitation; and with the introduction of new appliances there is a great field for enterprise in this industry.

Redwood.

The name "redwood" is used commercially to cover two distinct species, the coast redwood, which grows chiefly in a narrow belt along the coast, north of San Francisco, and the "big tree," which is confined to a limited region on the western slope of the Sierras. Only a small amount of "big tree" lumber is manufactured, however, nearly all of the commercial supply of redwood being furnished by the coast species. Redwood is unique in that it is cut in only one state, California, and in very restricted portions of that state.

Teak for Interior Trim and Furniture.

The latest fad, and by far the most expensive in interior trim and high class furniture is teak wood. The modernness of this fad, however, applies only to the United States, as for a thousand years or more in China as well a sother parts of the Orient teak has been the highest prized wood for furniture, shrines and religious objects. The famous blackwood furniture of that part of the world is made of Siam or Java teak. In Europe, more especially in England, the highest class of bank fixtures have been invariably made in teak wood. In the southern part of California, in Los Angeles, San Diego, Pasadena and thereabouts, teak has been used in a large number of the magnificent mansions erected by wealthy eastern people in that section, so aptly termed the millionaire's play-ground. In the majority of these palaces teak wood is used for interior trim, staircases, etc., with artistic especially designed teak furniture to match. The beautiful new Havens residence in Oakland is being fitted up with doors, wainscotting, beamed ceilings and floors of teak and hand-carved furniture of the same wood. One of the San Francisco furniture makers is busy at the present time on a large order of special designs in teak wood furniture for one of the wealthiest and best known families. The members of this family have always possessed the most correct taste in matters of art, and a number of the designs were drawn by the two talented young daughters of the house. This special furniture, by the way, is very costly, as teak wood in the plank is worth $250 per M. feet and is the highest priced wood known. The finished article, however, is well worth the money and labor and artistic effort expended upon it, as there is nothing in the world in the line of house furnishing in which more refined taste and individuality can be displayed than in the designing and selection of carved teak wood furniture.

Varnish Resistance and the Wood.

If you would observe a striking illustration of one of the many varnish intricacies, take a piece of yellow pine, and finish it with any hard tough varnish. Then run your fingernail across the finish, and you will find that part of the surface is easily scratched, and the rest is not affected at all. Upon examination, you will note the varnish that is scratched rests upon the soft grain of the wood, while the scratch-resisting varnish covers the hard grain.

Your Vacation Film

The success of your vacation pictures depends, most of all, upon your film. Look to it, if you hand over your Kodak for loading in a strange store, that no inferior substitute film is inserted. *The quality of your pictures is at stake.*

"Kodak film" means more than merely a film to fit your Kodak camera; it means film that is made by the Eastman Kodak Company. Kodak film is the film used the world over by explorers, by war correspondents, by hunters of big game, the film used by every expedition where adverse conditions demand absolute dependability in photographic equipment.

Experiment with no experiments. Look for "Kodak" on the spool end and N. C. on the box.

Review of Current Trade Conditions

Ontario.

There is, as usual of late, nothing important to note in the general lumber trade of Ontario, unless it be a weakening in the price of shingles, and some uncertainty about the exact condition of the market for hemlock. British Columbia shingles have probably commenced to feel the full effect of the United States tariff. Manufacturers in British Columbia anticipated being able to advance and maintain higher prices early in the season. Apparently they did not reckon on the competition from the East, or even that from the manufacturers of patent rofing. In country districts, moreover, corrugated iron as a roofing material is an important trade factor. The shingle men do not seem to have given it enough consideration. The result is that shingles have weakened, and there is talk of some of the mills closing down for a time. Three X shingles are selling now at $3.05, and in some cases $3. Lath give good indications of holding at about the same price as last year. There is no danger of an over-supply of lath so long as many of the firms turn their slabs into pickets, as they are now doing.

Norway prices are firm. Frequent reports are being made of logs being held up by lack of water. A slight advance would cause no surprise. Dry Norway is pretty well out of the market. Hemlock remains a puzzle, though there is no uncertainty about the fact that prices are difficult to maintain. Most of the manufacturers are hoping that they will soon get higher prices, but, considering the quantity on the market, compared with the demand, it is not likely that their hopes will be realized. There is still a large quantity of dry hemlock on the market, and a lot of new stock is being cut this year, also. In spite of this, however, one hears of an occasional sale of a large block of stock. One Georgian Bay manufacturer has practically closed a deal quite recently for the sale of one and a half million feet, and if it comes up to expectations another three and a half million may be included in the order.

White pine culls and box grades are a little stronger. The common end, however, is showing some weakness, especially in 4-inch and 5-inch strips. There is a large portion of this year's cut now in the hands of middlemen, for which high prices were paid. High prices are therefore being asked for it, and it does not look as though any concession in prices will be made. Manufacturers report that the volume of trade is quite good, and that collections are being readily met.

Prices of pulpwood in Ontario remain about steady. Niagara Falls quotations are as follows, f.o.b. cars, per cord of 128 cubic feet: Rough wood, $9; peeled wood, $10.50 to $11; two-foot machine rossed wood, $12.50 to $14.

Ottawa valley mill owners are fairly well satisfied with the market conditions prevailing at present as the demand for lumber has improved during the past month, and prices are steady. All stock better than mill culls is now in second and third hands. Shop grades are reported to be selling extremely well as a result of the good building trade. The improvement in the market for box lumber which made itself felt about a month ago is still continuing. Narrow short box is selling at $12 to $13. Lengths of 12 to 16 feet are somewhat improved, the 3 to 6-inch sizes selling at $14, while 7-inch and up bring $15 to $16. Dead culls are steady at $11 to $12 f.o.b Ottawa. There is a good demand for lath and shingles, although cedar clear butts have declined a little. Railway ties are dull, comparatively speaking.

Eastern Canada.

The log driving season in New Brunswick has come to an end, and from certain indications it is likely that the sawing season will be just about normal. There have been a number of extensive hang-ups, but they have been pretty well distributed among the various manufacturers, and most of the mills are assured of a sufficient quantity of logs to keep them operating until the rivers are frozen over. There is no sign of an over supply of logs of any kind, as operators during the last two or three years have been gradually becoming much more conservative and cautious. The market for English spruce deals is fairly satisfactory and steady, with a tendency towards greater firmness. Shipments have been quite extensive during the last few months, and stocks of English spruce deals are, therefore, somewhat reduced, amounting to about four and a half to five million feet at present. Merchantable sizes are quoted at from $15 to $15.75 per thousand superficial feet in the usual specification on the wharf at Miramichi ports. Spruce lath are rather quiet, but prices are unchanged. Shipments during June were much lighter to New England than they were in May. Present prices of spruce lath at Miramichi ports are about $2.65 to $2.75 per thousand.

The spruce market at Boston is not at all satisfactory, there being only an intermittent demand, which is confined largely to small lots. The only thing which seems to be able to induce business is a considerable concession in price. Many of the manufacturers are making plans to stop operating until an improvement comes about. Some of the buyers still claim that prices have yet to decline further before they will advance again. For this reason they are not buying ahead of time. Frames 9-inch and under are being offered at $23, which is the general price for most of the business in progress. There is only a light demand for randoms; 2 x 8 is selling at $21 to $21.50. There is only a quiet demand for small random. Boards also are slow, but prices are fairly steady. The demand for shingles at Boston shows an important improvement. A few of the dealers report that the demand is slightly better, but, in spite of this, prices have been low. For cedar extras the quotations have been as low as $3.15 to $3.25. There is also no improvement in the demand for lath, prices having in some cases declined. They range from $3.60 to $3.70 for 1⅝ inch, and from $3.40 to $3.50 for 1½ inch. At New York the wholesalers report that there is very little new demand for northern pine, although the quantity of business is fair. Prices are about steady, and the situation is apparently under satisfactory control. For this reason, it is believed that an increase in demand will be quickly followed by higher prices. Yard stocks are low. The demand for eastern spruce at New York is only fair and the business is quiet.

Great Britain.

There has been quite an increase in activity in the lumber movement at the Surrey Commercial Docks, where most of the lumber-laden vessels for London are now discharging. There has also been a satisfactory increase in the demand for lumber "from stock," a feature which is considered extremely satisfactory. At Foy, Morgan & Co.'s recent auction sale a small parcel of Vancouver clear silver spruce was quite an attraction and sold at good prices. For 3¾ x 4 inch the price secured was 4s. 8d. per foot cube, which is about the price of an average log of mahogany. Some clear silver birch sold at prices varying from 2s. 8d. to 4s. 8d. per foot cube, and planed boards were also sold at good prices—2½ x 7 spruce brought £8; 3 x 11 pine was sold at £10 10s.

The lumber business at Liverpool has not shown any important change in general conditions. Dealers are still holding back with their orders for future delivery. Spruce deals are steady, and arrivals are being rapidly taken into consumption. The market for future deliveries of spruce deal is unchanged for St. John shipments of ordinary specifications. Shipments from Nova Scotia ports are sold at the usual reductions. The c.i.f. birch market is firm and steady, and so is the spot market. The import of logs during the last few weeks has been rather heavy, especially from Quebec, and quite a fair proportion of these have gone into consumption. It is believed, however, that if arrivals were to be increased materially they would disturb the market, as the demand seems to be falling off Fresh birch planks are not being imported extensively. There has, however, been a satisfactory sale for those that have arrived. Quite a quantity of last year's goods are still in stocks, and are being offered at low prices, so as to clear them before the fresh planks arrive in large quantities.

Pine logs are exceptionally firm, both c.i.f. and spot, for prime and second quality Quebec wood. It is generally believed that prices will advance, and buyers are, therefore, showing a decided inclination to get into the market early. The deal and board markets are firm for c.i.f. values, particularly for the better qualities of boards. Lower qualities are easier, as they are suffering from the competition of woods which can be substituted. Quebec red pine is very largely taking the place of yellow pine. Stocks, however, are low, and there is a good and improved demand for fresh goods.

At Manchester and in its district there is a steady volume of trade, although there is no improvement to note. Spruce is not so firm as it has been of late. Anything which is a little out of the ordinary line is inclined to weaken. Some parcels have recently been sold at what were cargo values a few days previously. This condition, however, as a rule, prevails during the spruce season. Arrivals of flooring are quite extensive, and they are selling steadily at a basis of £10 2s. 6d., c.i.f. At Southampton the timber trade continues in a fairly satisfactory condition. Arrivals of new goods have been fairly heavy.

At Glasgow the amount of business in progress is only moderate. A cargo of spruce which recently arrived from St. John, N.B., met with good demand at firm prices. The market has been very bare of spruce for some time. The arrivals of sawn pitch pine have recently been quite heavy. American hardwoods are not meeting with much demand. The arrivals of Quebec goods are not being disposed of quite as satisfactorily as would be desired. The continued dullness in house

SARNIA, ONTARIO

building is restraining the demand for pine goods. A few lots of birch logs and planks have recently been sold from the quay at good prices.

United States.

The midsummer lull has made its appearance in the lumber trade of the United States. The great quantity of building in progress, however, will in all probability prevent the quietness from becoming so marked as usual. There is nothing important in the way of a change to note in connection with the northern pine trade at Chicago. In that city the building operations are going ahead steadily, and the number of new buildings are encouraging, as they indicate a material increase over the same period of last year. Prices of northern pine at the yards are quite steady. There is quite a good demand for cedar posts at Chicago, but the demand for poles is rather light Stocks, however, are limited, and prices are fairly steady. Hardwoods are moving satisfactorily, the stocks of dry lumber being strongly held, as a rule. There is no indication of weakness in connection with northern hardwoods at Chicago, the stocks being limited and the apparent amount of production being on the decrease. Plain oak continues strong, with a good demand, and prices are firm. It is expected by quite a number of dealers that this wood will advance during the summer. There is a fair inquiry for quartered white oak, and prices are steady. Quartered red oak is also moving fairly well, but the demand is not strong. Cottonwood and gum are a trifle firmer. Maple is in good demand and birch is moving freely at steady prices. The floor manufacturers have plenty of orders and prices are well maintained.

The demand for hemlock at Chicago and throughout the surrounding country is good, and stocks are only moderate, so that there is no prospect of weakness in the market. The demand for fir, spruce and cedar is just about steady. Yard stocks of spruce are moving actively, manufacturers being unable to keep up with their orders. Prices, however, are strong. Fir and spruce have also been selling well for car material. Dealers in western pine report that the Chicago [illegible], largely because they are now better able to secure stocks to fill their orders. There is a good demand for shop lumber. Yellow pine is not doing quite so well. There is a fair amount of business in progress, especially in construction timbers, but the prices show a tendency to sag. White cedar shingles are selling fairly well at unchanged prices. Red cedars are only steady at $3.32 and $2.84, Chicago basis. There is a good demand for lath, and prices are firm.

The demand for northern pine at Lake Erie points continues fair for the better grades and unsatisfactory for the box lumber and common boards. Whatever grades have to meet the competition of southern pine are dull. Hardwoods at Buffalo are quiet, as a result, probably, of the scarcity of stocks. Oak, birch and chestnut are the only woods in really active demand. The demand for hemlock continues strong at Buffalo, but stocks are plentiful. Competition from yellow pine and spruce is not bothering hemlock very much, as prices are low enough to prevent them from being substituted to any great extent. There is a good demand for western pine, and prices are strong. Shingles are only steady, at a basis of $2.15 for red cedar clears at Pacific Coast mills. There is a good demand, however, and no weakness is in evidence. At the same time, there seems to be no possibility of an advance.

Market Correspondence

A Normal Season for New Brunswick Sawing

Chatham, N.B., July 8th, 1910.—The fortnight has been productive of many features in the lumber business and industry of this section. It may now be said that some estimate may be made in regard to the prospects for manufacturing during the present season, as the log-driving season is now over, and it is possible to figure upon the supply of raw material. Judging from these supplies, it is probable that the sawing season will be about as usual. Hang-ups have been considerable. There is scarcely a manufacturer in any part of the Province but has some quantity, small or large, hung up; but there are still enough logs which have come out, and which are sure to come out, to keep most of the mills sawing until the rivers freeze up. At the same time, there has been no loading up with an over-surplus of logs, either cedar or spruce. The average quantity of the winter's cut seems to have taken a new level during the past three or four years. Three years ago, many New Brunswick lumbermen were decidedly "long" on logs when the slump came in the English deal market. Since that time woods operations have been marked by more caution and a wider recognition of the fact that the lumber markets are always uncertain. That caution has been quite apparent in last winter's logging operations and in the buying of logs during the present spring.

The local feeling in regard to the trade in "English" spruce deals is of a confident nature. The conditions governing the buying and selling of this, the most important of all lines to the New Brunswick lumberman, have changed but little during the past few months, so far as any rapid or remarkable changes are concerned. But, though no sensational features have developed, there has been a steadily increasing firmness for several months past. This improvement has matured in the face of shipments of considerable volume, the shipments from this Province being in sufficient quantity to keep stocks of "English" spruce deals somewhat smaller in quantity than is usual in the early summer. Four and one-half to five millions of feet would cover the available marketable stocks in this section, with possibly a million and a half superficial feet at smaller plants at outlying points.

An enquirer for merchantable spruce deals, sawn into sizes suitable for the English markets, would be quoted from $15 to $15.75 per thousand superficial feet, in the usual specification, 50% sevens and eights, 50% nines and elevens, on the wharf at Miramichi ports. Freight rates from Miramichi ports, the West Coast, Great Britain, average 32s. 6d. per standard.

The market for spruce lath is not as lively as would be required to cause any greater firmness in price, although no further concessions are looked for, judging from the tone of inquiries and the figures supplied in the way of quotations. Shipments of lath from New Brunswick to New England ports were much lighter during June than was the case during the month of May. During the latter month, quantities went forward which kept the wharves close to a clean-up, and a smaller volume of shipments in this line during June was quite natural. Present quotations on spruce lath indicate a local value of from $2.65 to $2.75 per thousand. Freight rates on lath from the north shore of New Brunswick to New York City are from 85c to 90c per thousand, and from Bay of Fundy ports to the same point, 65c to 70c per thousand.

Satisfactory Trade at Ottawa

Ottawa, July 11.—With the demand for lumber better than a month ago, the mill owners of the Ottawa Valley are fairly well satisfied with existing market conditions. The prices are steady. Everything better than mill culls is in second and third hands. Dealers report the trade much more satisfactory in respect of maintaining prices than a year ago. A large manufacturer relates that shop grades are among the most buoyant stock in the lumber trade. They are bought heavily to be made over into sashes, doors, etc, and are then readily sold owing to the brisk building trade. In fact, this situation has brought about the present improvement as compared with the early part of June. Unsettled weather in the United States had put a damper on orders to as great an extent as the uncertain state of the United States tariff did twelve months ago. The manufacturers of fine lumber in the Ottawa district are benefiting from local building activity as much as anywhere else. The building permits issued at the Ottawa City Hall for the first six months of the year amount to $1,300,000. This comparatively big sum is made up of permits for houses which will require a considerable quantity of lumber in their finishing. Such a total was never reached in the city in any ordinary year before. Last year's record was produced by the starting of the million and a half dollar hotel and station of the Grand Trunk Pacific, which, of course, were not undertakings of great consequence to lumber sellers.

The lumber sold for factory use is a little better than box. The betterment of the market for box noted a month ago is still in evidence. Narrow short box is worth $12 to $13. Lengths, 12 to 16 feet, are in still better demand. In widths, 3 in. to 6 in., it sells at $14, and 1 in. up, from $15 to $16. The production of dead culls is heavy, and a lot is held by middlemen. The price is maintained at $11 and $12, f.o.b. Ottawa, although earlier in the summer some dealers had expected a drop.

Lath and shingles are in good demand. A slight drop occurred in cedar clear butts, but inquiries are too numerous to indicate any general weakening in prices.

Some dealers report a slackening in the demand for railway ties. J. R. Booth will make about 100,000 pieces during the summer, and they have been all contracted for.

Water conditions are very favorable. The Chaudiere dam is operating with half the stop logs out, so plentiful is the flow of water. The log drives that were not abandoned in small streams early in the spring have come through speedily. The E. B. Eddy Company have received word of the delivery of their logs out of the Rouge and DesMoines Rivers, and pulp wood and saw logs are plentiful at all points. Shipping is brisk. The docks at Booth's mill have been filled all month.

The increasing value of the by-products of lumber mills is attested by the use J. R. Booth is making of the spruce slabs and blocks from his saw mill. These were formerly sold to city wood haulers for a trifle. Now they are picked out of the pine wood and carted to the sulphite mill across the street. Their value there is $5

Sherbrooke - Montreal - St. Catharines - Cobalt - Vancouver - Rossland
Works: Sherbrooke, Que. St. Catharines, Ont.

per cord. Formerly they were sold at less than one dollar, and were less desirable than pine, which makes a better fuel. A saving has also been accomplished in pine blocks. Instead of all going to the wood dealers, the best are selected for export to match factories.

Mr. Booth is building a barking mill, to be used in conjunction with the new pulp mill erected beside the lumber mill. When the barker is completed the new pulp mill will start operations. It is a concrete structure, 45 x 75 feet, containing eight grinders, with room for four more when they are needed. Mr. Booth's first pulp mill, built seventy years ago of brick, contains 14 grinders, consuming 80 cords of wood per day. The increase in the quantity of pulp needed shows the constant expansion of Mr. Booth's paper industry. For the first three years he sold all the pulp produced. Then, four years ago, he built a 100-ton a day paper mill. Early this year a cardboard mill, which cost $235,000, began operations with a capacity of 40 tons a day. In connection with the new barking mill, which is nearing completion, Mr. Booth will build two underground passages under his mill platform, to connect with the pulp mill. About 100 workmen are employed on building alone, in addition to the army of mill hands.

The E. B. Eddy Company are experiencing a great relief from the onerous and expensive work of other summers in hauling the winter's supply of pulp wood to the ground wood plant. The huge conveyor, 51 feet high and 500 feet long, has already deposited 5,000 cords of wood in a heap, to be used by the ground wood plant next winter.

Keen opposition to the proposal of the C. P. R. to close the Ottawa end of the Rideau Canal is manifested by the lumber interests. The Ottawa Board of Trade, as well as many other similar bodies in the Ottawa Valley, have petitioned the Dominion Government against the scheme. An alternative plan to construct a new outlet for the canal emptying into the Ottawa River at the Chaudiere, meets with the approval of some industrial and municipal men, but it may be too costly for the railway. The C. P. R. has asked permission to close the canal in order to utilize its bed for a right-of-way in conjunction with a mile subway crossing under the centre of the city and connecting the Union and Central Stations.

The Georgian Bay Canal Company has made another offer to the Government, in which it agrees to begins the gigantic work on a guarantee of 3½ per cent. of its bonds. This would mean something over $100,000, or perhaps much more, in view of the increasing cost of labor. All previous proposals of the Georgian Bay Canal Company involved too much outlay to permit of Government co-operation at present.

Notes.

The newly-formed McAuliffe-Davis Lumber Company of Ottawa celebrated Dominion Day by a parade through the city of sixteen of their delivery wagons laden with shingles, doors, dressed lumber, etc., from the five yards in which they have stock.

The Beaver Company of Buffalo, N.Y., propose to establish a branch factory in Ottawa for the manufacture of their brand of pulp board, which is used in many places as a substitute for plaster. The company would employ 150 hands.

Alex. MacLaren, of the James MacLaren Co., of Buckingham, was home this month for a few days from the saw mills in British Columbia. He announced while here that he would not rebuild the woollen mills owned by him at Wakefield, and which were recently destroyed by fire.

Poles and Posts in Good Demand in Quebec

Telegraph and railway poles continue in active demand at the different Quebec shipping points. At the present time there is an exceedingly healthy demand for almost all the different lengths. The big railway and electrical companies, whose supplies are drawn from this district, are in the market now, and poles are picked up as quickly as they can be taken out. Prevailing prices are as follows:

Ties—Standard railway ties, 6-inch	$0.45	to	$0.50
Mill run cedar ties	0.38	to	0.45
Telegraph poles, 30 feet long, 6-inch top	$2.25	to	$2.50
Telegraph poles, 35 feet long, 7-inch top	2.75	to	3.00
Telegraph poles, 40 feet long, 7-inch top	4.00	to	4.25
Telegraph poles, 45 feet long, 7-inch top	5.00	to	5.25
Telegraph poles, 50 feet long, 7-inch top	6.50	to	7.50

Exports of deals from St. John, N.B., during the winter season of 1909-10 amounted to 22,804 standards.

Every Province in the Dominion has applied for space for a provincial exhibit at this year's Canadian National Exhibition at Toronto, and the result cannot fail to be the greatest display of the national resources of Canada ever placed on exhibition. It will be a great chance for Canadians as well as visitors from other countries to see just what each corner of the great Dominion depends on for future greatness. And the net result cannot fail to be a pleasant surprise to Canadians as well as outsiders.

Factory Inspectors Report on Ontario Saw Mills

Factory Inspector Robert Hungerford whose work includes the inspection of many of the sawmills of Northern Ontario, refers to them in his latest report as follows: "I would not consider that I had written a report on factory inspection if I failed to offer something on the very interesting subject of saw mills. My district extending to that part of the Province where lumbering is the principle industry, I have visited a great number of mills of various capacity ranging from the small water-power mill cutting in the neighborhood of seven or eight thousand feet of lumber per day to the immense mill employing 500 men and cutting 400,000 feet of lumber per day; besides lath, pickets and box material. I suppose every Inspector has his hobby, but I want to say, for an interesting manufacturing institution give me the large and up-to-date saw mill. They are most interesting to me for many reasons. Their splendid organization is one of the interesting features. Every man standing at his post seems to form a part of the great machine that produces a continual stream of lumber from the jack-ladder to the pile in the yard. They are interesting because of the very quick results of the labor, it being only a very few minutes from the time the log leaves the water until it is in the lumber on the broad-way ready to be piled. They are interesting to the Inspector because there are dangers caused by the high-speeded and to some extent unguarded saws. The modern rapid working gun-shot or steam feed has a strong tendency to increase the danger, owing to its high rate of speed, and the increased rapidity with which the men on the carriage are compelled to work, as well as at the saws. The dangers of saw mills are often augmented by the lack of room . There are very few saw mills to my knowledge that have sufficient room to safely operate the machinery contained, many of them having doubled the capacity originally intended without increasing the size of the mill, thus dangerously crowding the machinery, and leaving insufficient space for passages. Indeed, some of them have no passages that can be safely used while the machinery is in operation.

I have seen mills where there was not six inches of space between the carriage and the wall on either side, while there should be at least three feet. Another interesting feature in the inspection of saw mills is that the work never becomes monotonous, owing to there being no two mills alike; and in going through many of them the Inspector becomes quite interested in his own safety, and, having a decided awakening effect, they are always interesting.

The saw mills and lumbering trade, as well as being interesting to me are most interesting and important industry to the citizens of the country. The wealth involved, and the number of people employed, when taken into considerationn, will rank it probably the most important industry in the country, apart from farming.

We have many thriving little towns in the northern part of the Province which are entirely sustained by the lumbering industry, the male population being employed all summer in the mill, while in the winter they are engaged in the woods getting out timber for the summer's cut.

In the inspection of saw mills it is seldom necessary for us to enter into any serious argument as to the ventilation or sanitary condition of the mill. Both ends of the mill are always open, and indeed in some cases both sides; and as they are almost invariably built on the bank of a lake or river, the supply of fresh air is always assured. The smell of the nice new lumber is always a beneficial as well as a pleasant feature of the saw mill.

The lath mill, which in an adjunct to every large saw mill, requires close attention on the part of the Inspector, on account of the employment of boys under the required age. The cutting of lath is generally let out by contract, and the contractor in his desire to increase his profits engages boys at as low a rate of wages as possible, and as the work is of that character at which a boy soon becomes expert and equally as useful as a man, it will be seen that there is some temptation for him to take a chance on violating the law. I have also experienced some trouble in keeping boys out of the shingle mill, which is another adjunct to the saw mill, where they are employed packing shingles.

I cannot close my report on saw mills without again calling attention to the great danger of operating a gang edger. I am pleased to report, however, that I have seen but one in use within the past year without a guard. They are becoming much more generally used, and if not thoroughly guarded will, I am sure, greatly augment the list of accidents in saw mills. In my opinion these machines can be rendered compartively safe by the use of a finger guard in front and the roller guard on the back, which I would strongly recommend to be used in all cases where gang edgers are operated.

There are many dangers in the saw mills, and much work for the Inspector, but I like them just the same.

Mr. A. Fraser, the well-known lumberman, of Fredericton, N.B., is leaving on a three months' trip to the Old Country. Mr. Fraser has not been enjoying good health of late, and he hopes that a change of air may prove beneficial.

Lumbermen

Who are critical in their demands always find in our method of selling direct to the regular trade, the close attention to the minutest details so absolutely impossible to secure when buying haphazardly.

To provide for filling all our orders promptly and satisfactorily, we have large and well assorted stocks on hand constantly—a feature that can hardly help pleasing you.

We want to prove to you that we are different from the others in many ways.

EDGINGS

Ontario

Strong & Murphy, lumber merchants, Belle River, Ont., have sustained loss by fire.

F. J. Snider, sawmill proprietors, Bruce Mines, Ont., are stated to have assigned to A Grigg.

Boyd, Caldwell & Co., Limited, Lanark, Ont., have taken a rental of Affleck's planing mill, where they intend manufacturing shingles. As soon as the building has undergone certain needed repairs and machinery has been installed the mill will begin operations.

At a meeting of the creditors of the Dunbar Lumber Company, of Elk Lake, Ont., held at the office of E. R. C, Clarkson and Sons, Mr. D. Connelly and Mr. D. McNair, of Lang, Joudin and Company, and Mr. M. M. Drake, the largest creditor and stockholder of the lumber company, were appointed to act with the assignee in the winding-up of the estate.

The Dominion Tar & Chemical Company, Ltd., of Great Britain, has obtained an Ontario license to carry on business as preparers of timber and merchants, timber importers, sawmill proprietors, tar distillers, etc. The capital of the company for its Ontario operations is not to exceed $30,000. E. B. Smith, Sault Ste Marie, is attorney for the company.

The Canada Gazette gives notice of the incorporation of the following companies: The McAuliffe-Davis Lumber Company, Ottawa, Ont., capital, $200,000; incorporators, W. H. McAuliffe, A. G. Gill, A. M. Davis and M. E. Davis, lumber merchants, all of Ottawa. The Continental Lumber Company, Limited, River Charlo, N.B., capital, $100,000, incorporators, J. E. Brochu, attorney, L. L. Maynard and A. Laberge, accountants, all of Providence, R. I., U S. A.

The Beaver Company, of Buffalo, N. Y., one of the largest pulp and paper manufacturing concerns in the United States, will locate a Canadian branch at Ottawa. The United States company employs 3,000 hands at Beaver Falls, N. Y. A large tract of land has been secured on the G. T. R. siding in the western end of the city. It is announced that work will start immediately on the erection of a large factory building. Some of the machinery has already arrived and additional shipments will be made from time to time as the building progresses. The statement is made that 150 hands will be employed at the start, and if the business increases, as the firm confidently expects, the staff will be doubled. The chief product of the new factory will be beaver board, which is coming into general use as a substitute for plaster. It takes the place of lath, plaster and wall paper for walls and ceilings. It is made of pulpwood, after being subjected to high pressure.

Eastern Provinces

Menard & Falstrault, lumber manufacturers, Longue Pointe, Que., Arthur Menard and Victor Falstrault have registered.

The Quebec Gazette gives notice of the incorporation of the Kiamiaka Valley Lumber Company. The capital is $20,000, and the incorporators are J. Dumas, Lac-aux-Ecorces, Que., and O. Lalonde, Val Barette, Que.

A St. John, N.B., despatch reports that a sale is under consideration of the West River timber limits owned by George D. Prescott, M.P.P., The prospective purchasers are the White Lumber & Mercantile Company, of Sussex. The price mentioned is in the vicinity of $85,000 and will include the timber areas and mills at West River.

A great future for the paper, pulp and concrete industries in Canada was predicted by Mr. J. A. Decew, Montreal, in a paper on the "Chemical industries of Canada," read before the convention of the Institute of Chemical Engineers at the Clifton Hotel recently. He declared that these lines of commercial endeavor were bound to take greater leaps forward in the next few years than any other.

The Continental Lumber Company, Limited, is the latest to enter the list of Restigouche River Lumber firms. This company has been granted a Dominion charter to do business. The incorporators are Jos. E. Brocher, L. L. Maynar, Arthur Thebege, Jos. A. Auger, of Providence, R. I., Walter J. Miller and John MacLean, of Campbellton, N.B. The head office of the company will be at River Charlo and the capital stock is $100,000. The company will operate the Currie mill at River Charlo

Mr. William Brown, of the Canada Woodenware Company, South Bay, N.B., has completed arrangements for the shipping to South Bay of the machinery saved from the burning of the Hampton factory some years ago. There is about $7,000 worth of this machinery on hand which can be utilized at the South Bay plant. Supplementary letters patent have been issued to the company, and the last stage has now been entered upon on the way toward the construction of the plant. The plant will be in operation shortly.

Senator Edwards, Ottawa; Angus McLean, of Buffalo, and H. G. Turner, engineer, of New York, recently visited the Hon. Jules Allard, Minister of Crown Lands at Quebec, seeking permission to erect a dam on the Grand Cascepedia River in order to construct a pulp and paper mill which will cost $2,000,000. The demand is opposed by rich American fishermen who contend that the erection of a dam will put an end to salmon fishing. Under the actual existing conditions the river yields a revenue of $15,000 to the Provincial Fishery Department. It is pointed out by the lumber men that if the pulp and paper plant is built it will bring the Province a yearly revenue of $150,000 in stumpage and dues.

Western Canada

An order for dissolution has been granted to the McNair Timber Company by the Supreme Court at Vancouver.

The B. C. Gazette gives notice of the incorporation of the Ruskin Logging Company, Ltd., capital, $100,000.

The Claresholm Lumber & Grain Co., Ltd,, of Claresholm, Alta, have changed their name to the Western Canada Grain Co.

A sawmill is to be built in the Nicola Valley by the American Timber Holding

Co., which has limits there. Those interested are F. H. Mitchell, F. Steinmetz and Frank Smith, of Seattle.

It is understood that the Dominion Shingle Company, of Aldergrove, B. C., will at once replace the shingle mill destroyed by fire on the 13th inst.

Nicola, B. C., is looking forward to possessing one of the largest sawmills in British Columbia, to be established by the American Timber Holdings Co., of Minneapolis. The mill will be "up the Coldwater," where the company is acquiring excellent limits.

The North Star Lumber Company, Limited, has secured an extra provincial license in the Province of British Columbia. Its head office is at the city of Brandon and its head office for the Province of British Columbia is at Vancouver. Mr. John Hanbury, Vancouver, is attorney for the company.

An extra provincial license has been granted by the Province of British Columbia to the British Canadian Lumber Company, Limited, whose head office is at Montreal. The capital of the company is $2,000,000, in shares of $100 each. The head office for British Columbia is at Vancouver, where Mr. F. L. Buckley is attorney for the company

The American Timber Holding Company has been registered as an extra provincial company in the Province of British Columbia. The head office of the company is at Huron, South Dakota. The capital is $6,000,000, in shares of $100 each, and the head office of the company for the Province of British Columbia is at Vancouver, where W. E. Burns is attorney for the company.

The new mill of the Edgewood Lumber Company, now under construction at West Robson, B. C., is progressing favorably, and the prospects are that sawing will commence about August 1. The mill will have a capacity of 15,000 feet of lumber a day. The Edgewood Lumber Company was organized last year, when a small mill, to aid settlement, was built at Edgewood, on the Arrow lakes. The company has an authorized capital of $100,000, and its stock is chiefly held in Nelson.

A Revelstoke, B. C., despatch announces that the Eagle River Lumber Company's timber holdings at Three Valley, and the Mundy Lumber Company's mill have been sold to an English syndicate organized by Cecil Ward, who organized the Canadian Timber & Sawmill Company, which bought the Trout Lake mill and limits from W. Cowan and E. L. Kinman. The new company is being organized as the Mundy B. C. Lumber Co., with capital stock of $5,000,000. The price paid for the limits, which were acquired from the department of the interior in 1904, and including the mill, is $1,250,000.

What is claimed to be the only compound engine in British Columbia coast sawmills has been installed in the mill of the Red Fir Lumber Company. It has double-pointed piston valves, cylinders 16 by 24 and 25½ by 24, 125 revolutions per minute, developing 250 h.p. It has a twelve-foot drive wheel and is installed on a solid foundation in the construction of which 175 tons of concrete were used.

It is reported that St. Louis parties have purchased 20,000 acres of timber in the vicinity of Port Renfrew for a cash consideration of over $100,000. The deal was put through by C. C. Michener, president of the Red Fir Lumber Company, of Nanaimo, but the names of the purchasers have not been made public. It is understood that a logging railway will be built from the property (the logging of which will commence shortly) to Port San Juan, to provide water transportation in the event of the Canadian Northern choosing an inland route.

London advices report the offering for subscription of 150,000 6 per cent. first mortgage sterling bonds in the Swanson Bay Forests, Woodpulp and Lumber Mills, Ltd., the directorate of which includes several well-known names in the timber trade, amongst which are Mr. R. M. Cox, of Liverpool; Mr. Thomas Mackarell, of Ottawa; Mr. J. W. Robson, J.P., of Robson, Miller & Co., Newcastle-on-Tyne; and Mr. C. E. Read, of the Hull Lumber Co., Quebec. The properties of the company consist of pulp and saw mills at Swanson Bay, and timber leases of over 86,000 acres of pulp and timber lands. Swanson Bay is situated on the North West Coast of British Columbia, opposite Princess Royal Island, and not far from the projected terminus of the new Grand Trunk Pacific Railway. It is stated in the prospectus that the British Admiralty obtain their supplies of spruce for oar purposes from this company, and that a cargo of over a million superficial feet of lumber is now being cut to the order of a firm of timber merchants in England.

Recent shipments of lumber from St. John, N.B., were as follows:

Vessel.	Cargo.
June 17—Rewa, New York	194,421 ft. spruce deals.
June 18—Toftwood, Rosario	2,667,791 sup. ft. scantling.
June 21—Frumentia, Fleetwood	2,075,449 sup. ft. spruce deals.
June 21—Terschilling, Brow Head, f.o.	2,748,807 sup. ft. spruce deals.
June 22—H. H. Kitchener, New Haven, Conn.	147,023 sup. ft. deal ends.
June 22—Tay, Salem, Mass., f.o	150,530 sup. ft. spruce plank and scantling.
June 23—Ronald, New York	1,701,000 spruce lath.
June 23—Annie Blanche, Boston	84,691 sup. ft. hemlock.
June 24—Nellie Eaton, Salem, f.o	114,822 sup. ft. spruce boards and scantling.
June 24—Moama, Vineyard Haven, f.o.	2,381,300 spruce lath.
June 25—Gladiator, Brow Head, f.o	2,660,955 ft. spruce deals.
June 25—Wavonia, New York	1,697,000 spruce lath.
June 25—Roger Drury, Vineyard Haven	1,883,700 spruce lath.
June 28—Peter C. Schultz, New York	213,425 ft. spruce deals.
June 28—Hunter, Mystic	156,808 ft. spruce plank.
	200,000 spruce lath.
	200,000 cedar shingles.
June 28—Abbie C. Stubbs, New York	1,100 pieces piling.
June 29—Flyaway, Hingham, Mass	43,615 ft. spruce plank and scantling.
	1,100,000 cedar shingles.
June 29—Lilla B. Hirtle, Barbadoes	1,135,000 cedar shingles.
June 29—Orthia, Glasgow	1,805,478 ft. spruce deals.

A band saw after runninng a few hours becomes longer in the back edge on account of the back pressure from saw guide, which gradually brings the tension more and more toward the teeth or sawing edge. If any little cracks exist by reason of improper finishing they will increase and the flaw will break. If the manufacturers of band saws would study the matter they would soon find out that the fault lies in the method of making the steel and preparing it for the saw.—James T. Burke, Chief Factory Inspector for Ontario.

McILVAIN'S SPECIALS

For Prompt Shipment

Ask us for prices on 150,000 to 200,000 feet of 4-4 genuine

Soft Yellow Tennessee Poplar

good widths and lengths, ready for for immediate shipment.

We have also a large stock of No. 1 and No. 2 Common ⅝ Poplar.

Get your order in early for

Red Oak

2 cars 5-4 common and better.

Here is your opportunity to get interesting quotations on

Quartered Oak

150,000 feet 4-4 No. 1 Common and better stock, dry, nicely manufactured, well-figured, and good widths and lengths.

What about

Chestnut

We have 200,000 feet of 4-4 to 8-4 No. 1 Common and Better bone dry for prompt shipment.

We have just received a large block of

Soft White Pine

4-4 to 16-4. Dry, well manufactured, good widths and lengths. Can ship separate or mixed cars.

You can get a good price on this No. 1 Common and Better tough

White Ash

200,000 feet of 4-4 to 5 inch, largely Firsts and Seconds

10-4 to 16-4. 100,000 ft.

Hard Maple

Also same amount of Soft Maple. Ask us for prices.

For Matching Hard, Cross-Grained and Knotty Lumber

The Shimer Cutter Head

is the Only Tool You Can Rely Upon

It has strength, Durability and correct working principles. It feeds faster, works smoother, cuts true to pattern. No fitting, no trying—no filing to shape. You sharpen the Cutters with a file and set them with a gauge—plain as day.

Everybody profits by their use. For Flooring, Ceiling, Siding. For Ship Lap, Jointing, Double Ceiling. For Doors, Sash and Special designs. Coping Heads to match.

SEE THAT YOU GET THE GENUINE

Look for the NAME and TRADE MARK **"The Shimer Cutter Head"** stamped on every Head we turn out. A dealer who would sell you an imitation means to deceive you—send them back and demand the genuine article with our guarantee for your protection.

For Sale to Close an Account
Crown Granted Timber Limits and Lands

in the

Province of British Columbia, Canada

The undersigned has received instructions from the owners who desire to close the account, to sell by private treaty

Forty Timber Limits and Lands

situate in the Salmon River Valley, West Kootenay, British Columbia, from thirty to forty-five miles north of the United States border, and upon, or contiguous to the Nelson and Fort Sheppard Railway which runs between Spokane, Washington, and Nelson, British Columbia, connecting with the Great Northern and Canadian Pacific Railways, and affording access to the United States and Canadian markets.

The limits contain in the aggregate thirty-eight thousand acres, and are comprised of bottom lands and benches of hills, constituting one of the best bodies of timber in the Central Southern part of British Columbia. Subdivision of the tract has hitherto been consistently refused. Individual limits contain from two hundred and fifty to twenty-one hundred acres, with from three million to forty-five million feet of Cedar, Pine, Hemlock and other woods of excellent quality upon them, in addition to large quantities of Cedar Poles—prices run from $5,000 up according to Stumpage and Location.

Some of the limits are essentially Cedar Pole Propositions, and contain large quantities of the very best quality of Cedar Poles from twenty-five to seventy-five feet in length, free of limbs

The properties are Crown Granted, and the timber upon them may be exported. The Timber is subject to a Royalty of fifty cents per thousand feet, when cut.

A considerable quantity of the land is available for fruit land when cleared, and the owners are prepared to give a deed of land and timber, or a license to cut timber only for a term of years, at the option of the Purchaser.

TERMS OF SALE:

In order to close the account, very easy terms of purchase will be given, namely, twenty-five per cent. cash, and the balance in four equal annual instalments, and twenty per cent. cash with balance in six equal annual instalments—interest at six per cent.—with operating privileges which will assist purchasers to pay for limits out of stumpage.

The character of the properties together with the easy terms of payment present a unique opportunity to persons of moderate means to acquire valuable limits for either operation or investment.

Prices and further information may be had upon application.

OUR QUALITY STOCK: Flooring, Ceiling, Partition, Novelty Siding, Bevel Siding, Moulding, New Brunswick Cedar Shingles, Lath, etc.

"QUALITY IS THE BEST POLICY"

Largest and Best Assorted Stock of Dry Spruce in Canada

INVESTIGATE THE NEW METHOD

No. 90 Planer, Matcher and Profiler

You can make the highest quality of flooring on the new No. 90 Planer and Matcher at 200 feet per minute. We will prove that you can do this. Our guarantee of proof is conservative because flooring has been run on the No. 90 at more than twice this feed in our own factories. The machine is built strongly enough and is powerful enough to stand up to a feed of 500 feet per minute—so when we say that you can run "A1" flooring at 200 feet per minute, you see that our statement is really conservative.

All your outline work (drop siding, beaded partition, lap rustic, V ceiling, casing, etc.) can be run on the No. 90 at 150 feet per minute! Think of it! And even at this very fast feed you will get better work than you can get from any moulder or four head matcher at 50 feet per minute.

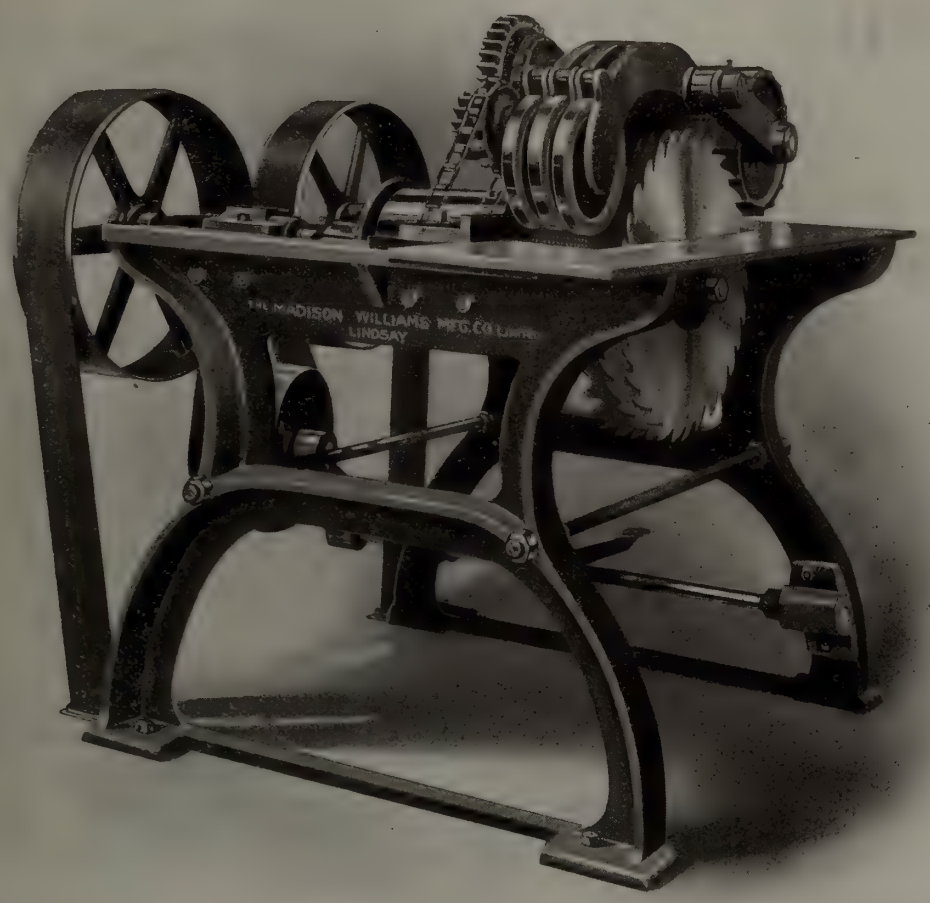
In other words, you can do much better work and three times as much of it with the No. 90 as you can get from any other four head machine. Stop and think this over! It means a whole lot!

The No. 90 is a simple, substantial machine built for speed and hard work. Every part performs a duty—there are no superfluous pieces.

The machine is equipped with the powerful Automobile Chain Drive.

It is also equipped with the "Berlin" 6-bit Round Top and Bottom Cylinders which will handle twice as much stock as a soft knife machine and at the same time save you 15 to 30 per cent. in grades.

For flooring, we furnish you 12-bit side heads especially designed for this fast feed work. At a feed of 200 feet per minute they will not tear out even the knots and cross-grained places as much as other heads will at 60 a minute.



If you have not received a copy of the June "Berlin Quality" Bulletin, you should write for it NOW. It contains four pages of description about this Fast Feed Working of Flooring and Outline. It is worth your careful reading.

RESULTS ARE WHAT COUNT

A Combined Skidding and Loading Machine that will clear up the largest area at a setting and can be moved and set up in the shortest possible time will get the best results.

The latest Russel machine has some distinct features that save time and trouble, consequently money. Note the new method of suspending skidding sheaves. They are hung from a vertically hinged jib or triangle, the outer end of which is guyed by two lines one on each side, which are power-tightened and can be set while skidding lines are going out. The guy lines lead back so they do not interfere with skidding or loading. The uppermost leg of the jib has a spring connection to the tower, reducing shocks. All skidding strains are absorbed by the guy lines. The swinging boom is operated by wire ropes passing through sheaves suspended from a steel frame projecting from tower and leading to two drums on loading engine, controlled by one lever. Machine is raised or lowered by hydraulic or patented gear jacks. Built for 2 or 4 lines, with stiff or swinging boom, constructed entirely of steel, except loading boom. Is without question the strongest and fastest machine of the day.

RUSSEL WHEEL & FOUNDRY CO., DETROIT, MICH.

Cheapen Your Logging

By Using the

Lidgerwood Skidding Method

The machine shown in the cut above will pull itself on snow or bare ground wherever a pair of horses could take a drag sled, dray, jumper, skidding or single sled. From any location alongside such a road it will reach to the stump a distance of one-quarter of a mile or less in every direction and will skid all trees in full length or in log lengths. It will place the logs on skids or sleds or in the stream or lake as desired. It will re-yard logs, either taking the logs direct from the teams or from the skidway, or where left by itself at a previous setting. It operates throughout the year and is absolutely independent of ground conditions; that is, such as windfalls, underbrush, rocks, cliffs, ravines, or the steepest slopes, operating under such conditions almost as cheaply as over smooth ground.

All swamping, rolling, sliding and expensive cant dog or other hand work is eliminated. It does not fill the logs full of gravel and it does not brake or otherwise damage them.

It requires a skidding crew of eight men, uses for fuel one and one-half cords of wood per day. It will skid the largest tree or a cord of pulpwood, or several small logs at each trip. It will clear 40 to 60 acres at each setting, moves itself quickly from setting to setting, operates independent of weather conditions, does not "eat" when not working, does not have to be "sprung out" and has a working life of fifteen years.

WRITE US FOR FURTHER INFORMATION

Allis-Chalmers-Bullock, Limited

Manufacturing Agents for Lidgerwood Mfg. Co., New York, N. Y.

Montreal, P. Q. **Vancouver, B. C.**

One of the Best Investments for a Box Factory is a well built and modern Variety Saw

New No. 260 VARIETY SAW

It is a time and money saver, not only in manufacturing boxes and shooks, but a variety of other work will drift into a box shop occasionally, which only a **Variety Saw** will be able to handle and the profits on these orders will usually put any returns from the choicest of box orders away on the shady side.

We call your attention to a brand new machine made especially for variety work in box factories, jobbing shops, etc. namely,

Our New No. 260 VARIETY SAW

This machine possesses advantages in quick and accurate adjustments over any other variety saw and will be found a decided improvement in Ripping, Crosscutting, Boring, Bevel Sawing, Cropping, Grooving, Mitering, etc.

We invite you to write for Circular 11-R which tells all about it

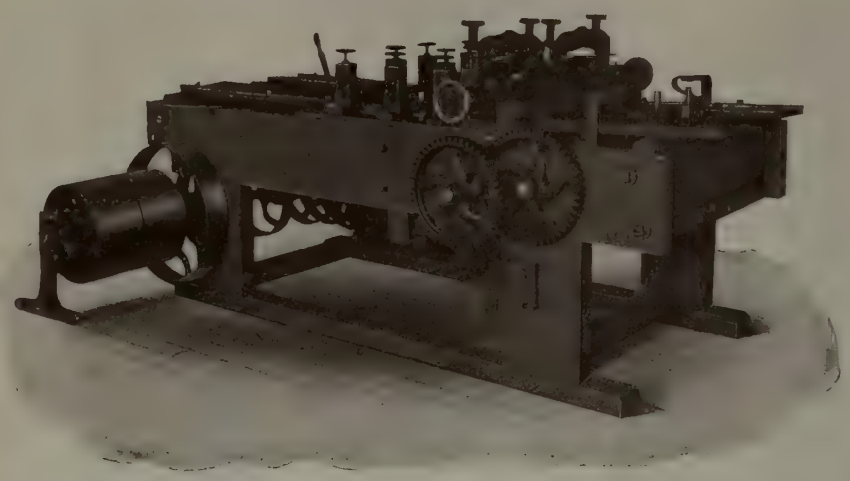
The Mammoth Growth *of the* DISSTON SAW INDUSTRY

is not the result of chance; it is not because of priority in the field; it is because Disston Saws have been consistently good and consistently improved every year since the foundation of the business.

The pioneers who cut their way through the forests of the West, rearing cities where there were only wildernesses, relied upon the Disston Saw as one of their chief mechanical aids.



In every part of the civilized world to-day Disston Saws are in use, running the gamut of saw superiority from the smallest hand saw, butcher saw or hack saw to the largest circular and band saws.

Knowing how to make every particular saw best for the purpose for which it is to be used—and making the steel that goes into it also best for that purpose—and subjecting every one to rigid tests—is the chief "salesmanship" in the Disston business.

If you are unable to obtain the Disston Brand, write us and we will see that you are properly supplied.

HENRY DISSTON & SONS

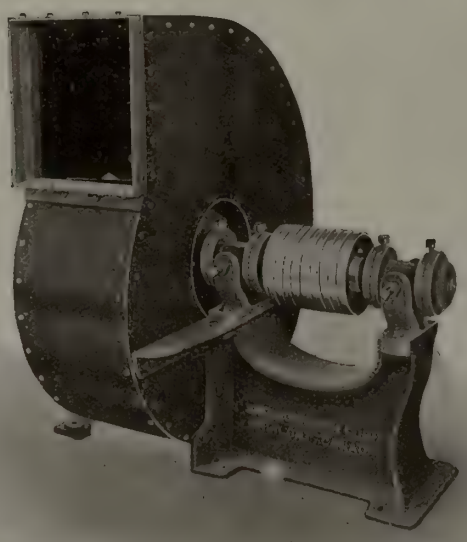
Keystone, Saw, Tool, Steel and File Works
PHILADELPHIA, PA.

Canadian Works: Fraser Avenue, Toronto, Canada

Eclipse Double Bed Clapboard Planer



If you are a stranger to them and they to you, get acquainted.

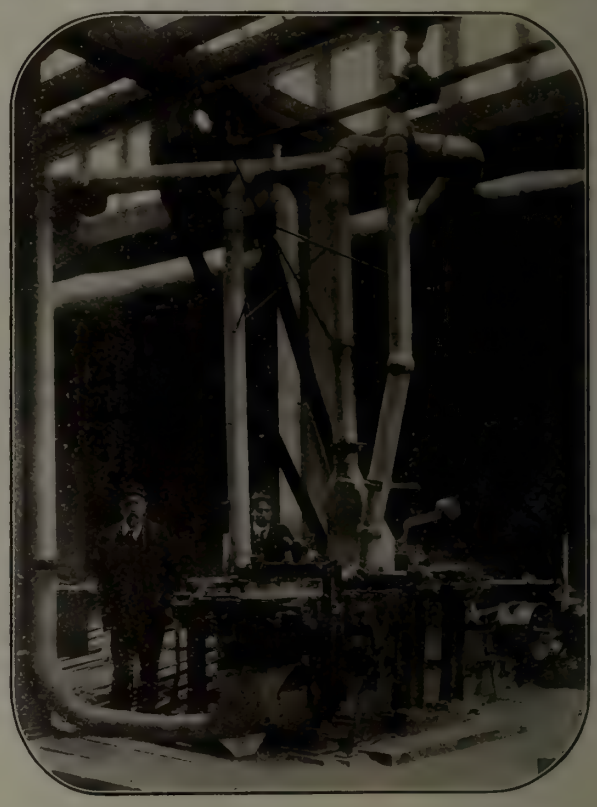
"This is One of Three in the Family and Every One a Wonder"

Said the head of one of the leading **Clapboard Manufacturers** the other day. He based his opinion on a "working acquaintance" gained in their own mill. On the start he was against us but is now another one added to the hundreds won over and convinced—as we want to convince you.

Sleeper & Akhurst, Coaticook, Que.

Sheldon Slow Speed Exhaust Fans

The fans that are revolutionizing the shaving exhaust business. They will handle wet or dry, long or short shavings and sawdust, and will do this work with a guaranteed reduction in speed of from 25 to 40% less, and with a power consumption of from 20 to 35% less than any other exhaust fan.



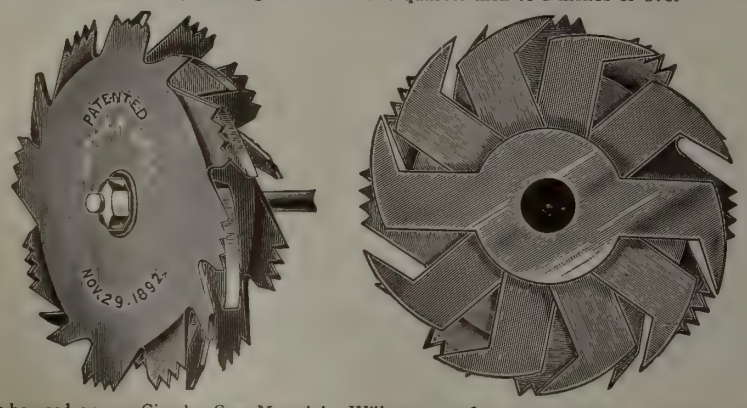
Descriptive circulars sent on request.

Sheldons, Limited - Galt, Ontario

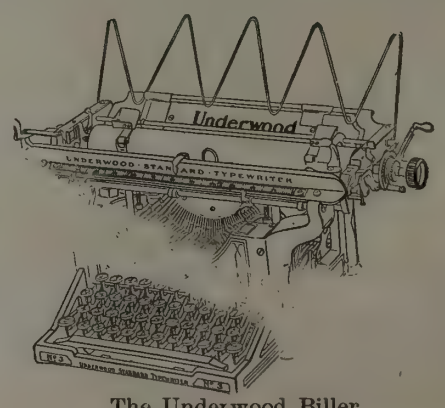
W. E. Dillon Company

Limited

76 and 78 Richmond Street East, TORONTO



Cut shows part of plant installed by us in the Mickle-Dyment Lumber Co's. mill, Toronto, and is one of the most complete plants in Canada. We make a specialty of dust collecting systems and have expert mechanics on this work. Systems designed and installed.



LET US ESTIMATE ON YOUR WORK

HUTHER BROS. PATENT GROOVER OR DADO HEAD

For cutting any width groove from one quarter inch to 2 inches or over

Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense.
HUTHER BROS., SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturers Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

The Underwood Biller

THERE have been 22 championship contests for speed typewriting. The Underwood has won them all.

Being the best machine for the most exacting requirements it does not lose any of its efficiency in the more ordinary uses.

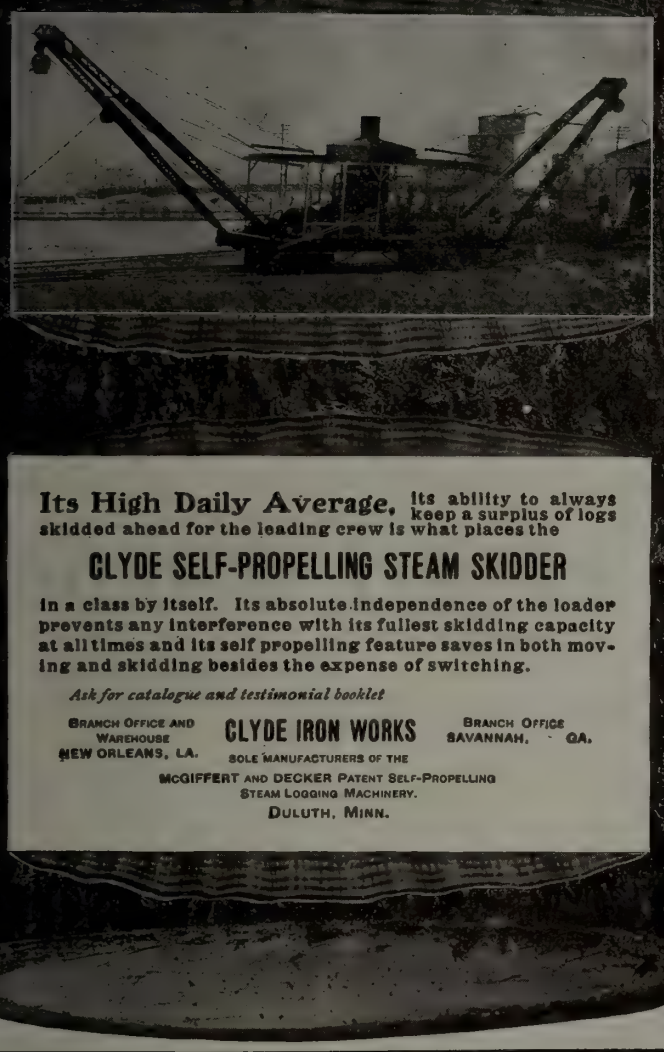
Head Office in Toronto at 7 and 9 Adelaide St. East

"Trident" Steel Loading Chains



These Chains are made with extra long lapped, self locking, swelled welds.
The very best Chains for log conveyors, decking, log haul ups, hoisting, loading, etc.

PINK'S PEAVEY HANDLES in select split Rock Maple are the Standard everywhere.

BEAL'S PATENT TONGS for handling pulpwood, ties, or light logs of any kind.

THOMAS PINK, - Pembroke, Ont.

Manufacturer of Logging Tools

Its High Daily Average, its ability to always keep a surplus of logs skidded ahead for the leading crew is what places the

CLYDE SELF-PROPELLING STEAM SKIDDER

in a class by itself. Its absolute independence of the loader prevents any interference with its fullest skidding capacity at all times and its self propelling feature saves in both moving and skidding besides the expense of switching.

Advertiser

Say Old Chap!

Non Advertiser

Do you know that I had quite a lot of second-hand machinery that was no use to me so I put a small "ad" in the **"Canada Lumberman"** and sold the whole line? The "ad" only cost me a couple of dollars and I got ever so many replies.

Why don't you sell those old machines of yours, there are lots of fellows who would be glad to get them?

The "Wanted and For Sale Department" of this paper is buying and selling second hand equipment every day.

A GREAT PROFIT BUILDER

just describes our

No. 171 Undercut Face Planer

Four reasons why this machine is rapidly replacing the time honoured hand planer

IT

Does the work of 3 or 4 Hand Planers

And does it as well or better

Is great on winding Stock

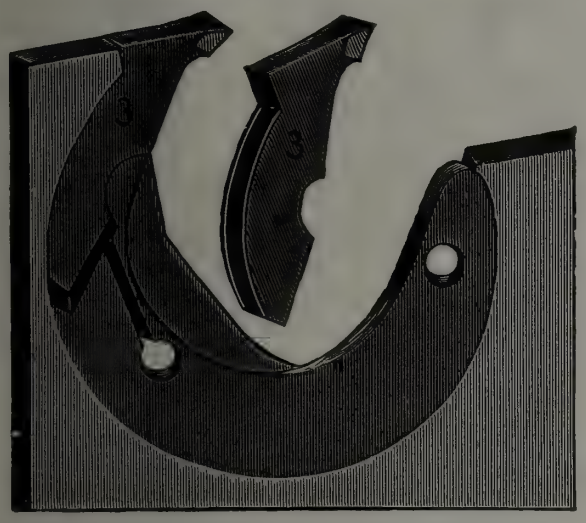
Will soon pay for itself in the saving of stock alone

Is absolutely safe

Accidents are impossible on it. No matter how careless the operator may be, his fingers cannot get caught in the knives.

We should be glad to have you give it a 30 days' trial at our expense aud prove that our claims are not exaggerated.

WRITE FOR PARTICULARS AND LIST OF USERS



JOHN BALLANTINE & CO., Ltd., Preston, Ontario

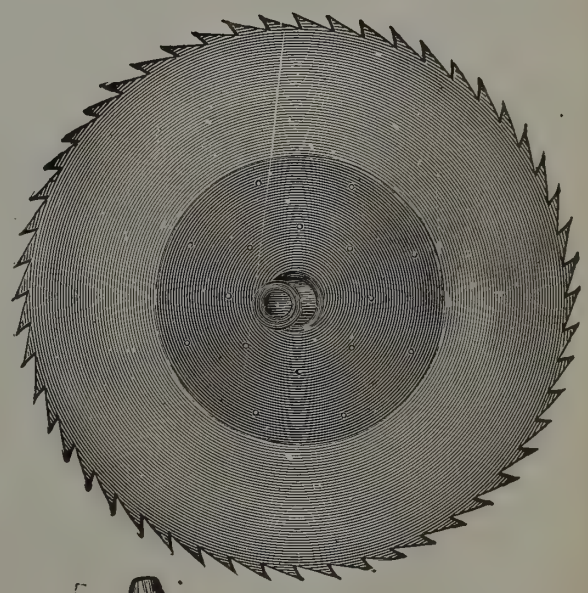
R. H. SMITH CO., Limited

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the Simond's Process in the Dominion of Canada

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

INSERTED TOOTH SAWS

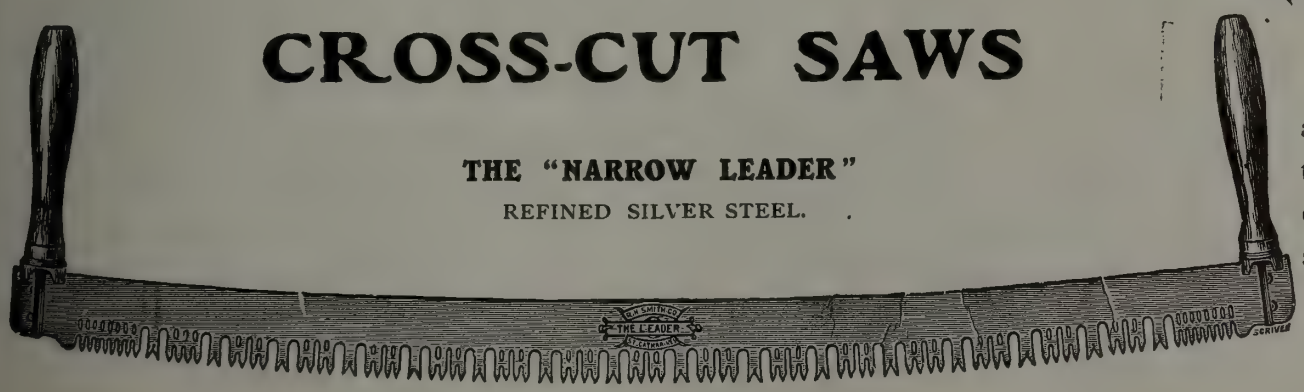


Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws pertectly.

SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.



Run a "Simonds" and you will increase your output.

CROSS-CUT SAWS

THE "NARROW LEADER"

REFINED SILVER STEEL.

The Simonds Temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

R. H. SMITH CO. Limited St. Catharines, Ont.

Heavy Duty Lath Machine

This machine has so many good points that our space will not permit us to tell about them. We will, however, be glad to send a full specification on application.

4-SAW LATH BOLTER

The general construction of this machine speaks for itself.

We believe that more important features are combined in it than in any other Lath Bolter of its capacity on the market to-day. Here are a few of them:—

The front and rear pressure rollers are power driven.

The front pressure roller raises towards the saws and being power driven, prevents any pieces from flying back out of the machine.

The end bearing may be easily removed, which permits the saws being taken off the mandrel for filing. This does not disturb the mandrel.

Full information regarding this machine or anything else in our line you may require, cheerfully given on application.

The E. Long Manufacturing Co., Limited, Orillia, Ont.

EDGERS

Garland Gang Edger

Built in all widths, and saws shifted by levers or hand wheels.
Will edge lumber perfectly and will handle anything up to six inches thick.
Notice how mandrel is carried at pulley end—the whole machine is made in the same solid manner.

Combination Gang Edger

How do you handle your small cants?
Is it costing you more than you think it ought to turn them into boards?
Here is a machine on which you can cut cants as large as eight inches thick into boards, and **at the same time** you can edge the lumber coming from your band or circular.
It is a very handy machine in a great many mills. Would you like to know more about it?

DURABLE FLOORS ARE MADE OF
Thin "Empire" Flooring

This flooring is 3/8 inch thick, just a little thicker than a carpet, and can be laid on an old floor without disturbing or multilating the interior woodwork. Also used largely in new buildings.

Carpets wear out. Hardwood floors last a lifetime.
Carpets are not sanitary. Hardwood floors conserve health.
Carpets soon fade and deteriorate. Hardwood floors are an asset of increasing value.
Carpets cause the house cleaning horror. Hardwood floors emancipate the housewife.

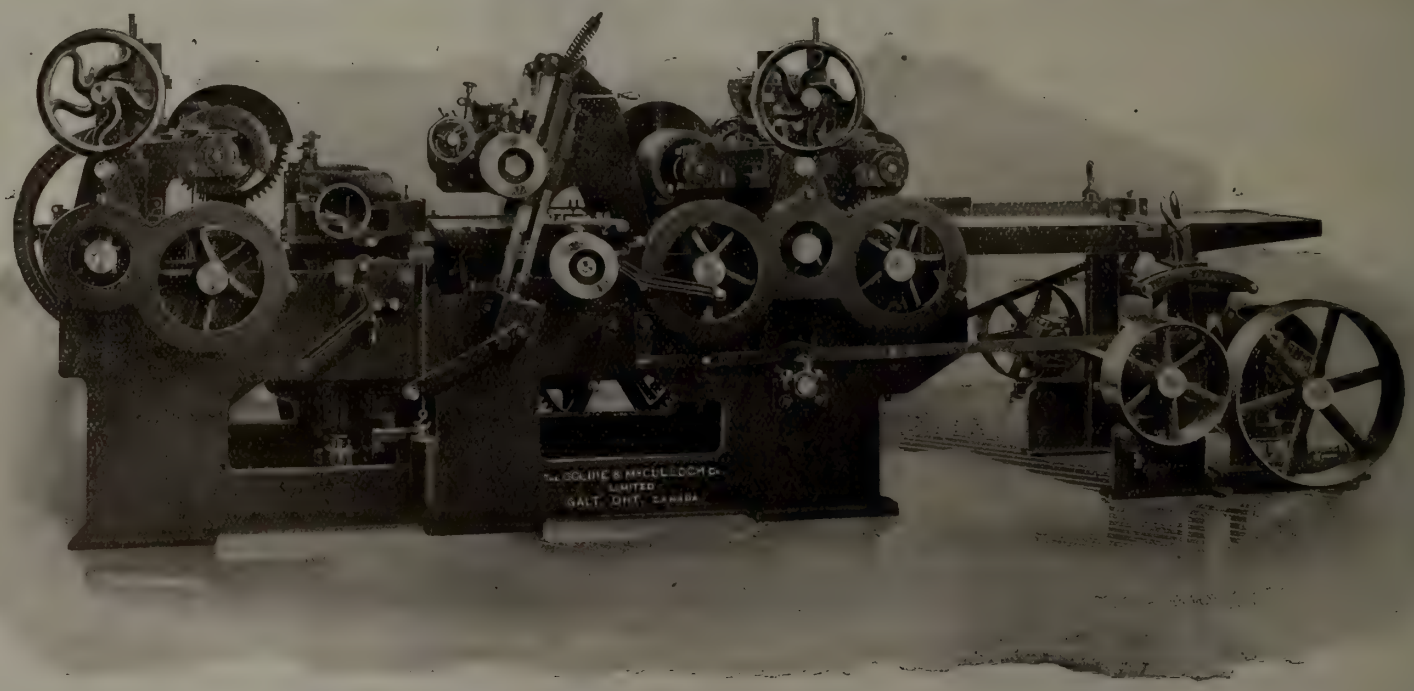
WE have been making Knives seventy-eight years, long enough for us to be sufficiently sure of the Knives we make, to give an unqualified guarantee of satisfaction with them.

The steel used in Simonds Canada Saw Co., Limited, Knives is our special crucible steel, made in the Simonds Steel Mill especially for Simonds Saws and Knives.

Thus you will see we start right, and thereafter the steel is handled most skillfully until the finished knife is produced.

Whether you want Planer, Veneer, Stave, Shingle, Moulder or any other woodworking machinery knives, you may go as far as you like, try as many makes as you like, you cannot improve on Simonds Knives. Of course, different conditions require different knives, a difference in the temper most likely. Given an idea of the kind of woods to be cut, the machine on which the knives are to be used, and the dimension, we guarantee to give you Simonds Knives that will be perfect in balance and temper exactly right to do the greatest amount of smooth cutting with the least amount of wear and care.



When you buy Knives, always buy Simonds

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For Manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 30 Toronto, August 1, 1910 No. 15

Refining Lumber at the Mills

Increasing freight rates, and the hopelessness of ever inducing the railway companies to act upon reasonable, honorable lines, in the matter of estimating the weights of cars, are placing too great a burden upon the shippers of lumber, and of many other commodities for that matter, that an extra impetus has been given to the movement toward refining lumber as completely as possible at the mill before shipping it. This problem of refining lumber is, in fact, about the most important matter which the lumber manufacturer has to consider to-day. When freight charges are so exorbitant, and promise to become even more so in the course of time, it is all important that nothing should be shipped which is not in its most economical shipping form. This means simply that at the producing end, knots and other defects which go to waste in the factory, should be cut out. In a general way, it means cutting dimension stock for factory use in the woods. The freight item being an important one in the lumber industry, and the low-grade stock being something of a burden and bringing only a small price, a price frequently below the cost of logs, and the quantity of this stock increasing in proportion as the timber resources are cut out, these reasons are leading mill men to figure more seriously on ways and means for realizing more out of the low-grade.

Formerly, when there was only a comparatively small percentage of it, because the timber was better, low-grade lumber found a ready market, at a low price, it is true, but it all helped out a little, so not much attention was paid to it. Now and then a furniture factory would conclude to go into the mill business and cut its stock to specific dimensions in the woods. Unfortunately, some of these ventures did not prove very successful, because too much was expected of the saw milling end, and there was too little specific knowledge of saw milling by the people undertaking it. Also, lumber values were lower and there was not the same inducement to go to extra trouble about it. Some furniture facories persisted in it, however, and others have from time to time arranged with mill men to cut certain regularly used stock into smaller dimensions in the woods, thus saving freight and furnishing better material, too, because it dries up better.

Much greater importance, however, has been given to the subject because of the continually increasing percentage of low-grade lumber. It is a very questionable undertaking to ship to the factory, sometimes a long distance away, lumber which will produce perhaps only 50 per cent. of clear cuttings. The 50 per cent. of waste could much more profitably be thrown away in the woods than at the factory, where it costs money to deliver it. For these reasons a general tendency has sprung up of recent years among mill owners towards the working of specific small dimensions at the mills. Hand in hand with this has appeared the movement, now well under way, in the direction of utilizing so far as possible every by-product of the saw mill. It is possibly a matter only of a few years now before larger and more sucessful mills will be entirely revolutionized in these directions..

Sash and Door Trade Troubles

Every branch of business connected with the manufacture of lumber or lumber products has its own peculiar troubles, which at first thought one would imagine could be easily removed. Enquiry, however, almost inevitably leads to the conviction that the remedy is nearly as complicated a matter as the disease. As a fair example of this, take the business of manufacturing sash and doors. In Ontario recently the manufacturers held an informal meeting, at which the only point upon which all were thoroughly agreed was that there was no profit worth mentioning to be secured at present, nor had there been for some years past. When it came to suggesting a remedy there was some sort of agreement that a uniform price list should be prepared and every member of the industry should undertake to live up to it. But there was a strong impression prevalent that it would not be possible to induce all the manufacturers to observe the requirements of such a price list. The same thing has been tried in the past, and while at times it has been briefly successful, the end has always been the same, and every man in the business has at one time or another awakened to the unpleasant knowledge that some of his fellow-manufacturers were cutting his business throat.

Broadly speaking, these are the troubles of the business to-day, and there are many minor factors helping to bring about this result. From a purely business point of view one of the most important causes of trouble is that the demand for doors is too varied. There are far too many of what are known as custom orders and too few stock orders. One might imagine that custom orders would be profitable, but such is not the case. Even at a higher price the custom orders do not compensate for all the rearrangements that have to be made in machinery to turn out the special products. Doors and sash for stock orders may be run out in great quantities with rapidity and ease and under reasonable conditions they should afford good profits. Many of the manufacturers to-day, therefore, are discouraging the special orders. One of the reasons for the excessive cost of manufacturing custom doors is the fact that the laborer of to-day is not as skilled as he was some years ago and he is slow to adapt himself to the necessary changes in the machines. It is a constant source of surprise to the purchaser of doors that the custom work is so expensive. It is none the less a matter of fact, that will be vouched for by all manufacturers, that the cost of a stock door is less even than that of a custom door of smaller size. Specializing, therefore, is the only remedy. When a manufacturer can refuse all but stock orders his manufacturing costs will be greatly reduced. And when custom orders are all handled by one manufacturer the cost of producing them will be likewise reduced, by the fact that laborers will become better able to adjust themselves quickly to the necessary changes in the machines, when they are employed entirely upon this class of work.

There are many other difficulties which make the manufacturing of

dooors a perilous matter from the profit point of view. The cost of machinery is a very serious matter, and one which it is very difficult to foresee or regulate. The specialization which prevails in the manufacture of machinery has resulted in wonderful improvements. So rapidly have these been made that door-making machinery has been going out of date more quickly than almost any other. The cost of manufacturing has advanced until it is quite double that of wages. Coincident with this is the trouble caused by the small manufacturer, without sufficient capital to renew his machinery. He turns out a poor door at a high cost, finds he has to sell below the general market price to induce anyone to take his doors, and by so doing makes trouble for everyone concerned. The tendency towards specialization in manufacturing and the increasing amount of capital needed in the business will in the course of time eliminate the small manufacturer, but in the meantime he is a thorn in the flesh of the large manufacturers.

Last but by no means least of the worries of the sash and dooor manufacturer is the difficulty of figuring costs accurately. The costs change from day to day and are so elusive that one must be on a perpetual hunt in order to keep them properly checked up. This is the result, more than anything else, of the mixing of custom and stock work in the same factory. Once these can be separated the cost finding bugbear will be dispelled. It is clear to anyone from these few considerations that what the business needs more than anything else is a mutual understanding by manufacturers of each other's special conditions. The recent formation of an association of sash and door manufacturers in Ontario will perhaps lead to a solution of some of these difficulties.

British Columbia's Practical Forestry Policy

Premier McBride of British Columbia, in a recent address before the Victoria Board of Trade at their annual meeting, spoke of the resources and development of the country. The most interesting portion of the address, from a lumberman's point of veiw, was the reference to the work of the Timber Commission. Premier McBride's announcement that the commission's report is expected in a few months, and that the Legislature will pass effective legislation based upon the report, gives promise of the settlement of many of the difficulties which have long been a source of worry and expense to the lumberman. The granting of renewable licenses at the suggestion of the Commission in its interim report, indicates that both the Government and the Commission have realized that the interests of the people and the interests of the lumberman are the same. If the governments of other provinces could be induced to take a similar view of the matter, the lumbermen would be more likely to take a keen interest in their properties. Another reference of Premier McBride's showed that both the Government and the Commission were working carefully upon a plan for reducing the loss of timber by fire. It is probably safe to conclude that, in addition to increasing tthe fire-fighting staff, this plan will involve extremely strict regulations regarding the railroads, which have been proved to be one of the greatest causes of fire.

Premier McBride's references to lumber matters were in part as follows:

"The timber industry of the province is a subject which it is difficult to deal with in a few words. The output of lumber for 1909 was 775,000,000 feet, valued at $12,000,000. Of this, 450,000,000 were cut from coastt mills and 325,000,000 feet from mountain mills. The total cut is an increase of 10,000,000 feet over 1908. The outlook for the present year is particularly bright.

"In connection with the timber industry, the Government is taking special pains to secure the best means of conserving this resource by means of a Commission, which will report on the best methods to pursue, so that the wisest legislation may be enacted. We are fully determined to protect this unrivalled asset. The Commission has visited every portion of the province and collected data of a varied description. It has also visited Washington and had a conference with Mr. Gifford Pinchot, until recently chief forester of the United States Government. It has been to Ottawa and consulted with timber experts there. The Government expects that the report will be ready within the next few months, and at the next session up-to-date legislation to protect the timber wealth of the province will be brought down.

"To guard against the danger of forest fires there is a staff of fifty-three district fire wardens, three divisional fire wardens and one chief fire warden. This is nearly double the force of a year ago. The vote for fire fighting is $75,000. Besides this all road foremen have been appointed as assistant fire wardens with instructions from the Public Works Department to put on crews to fight fires in case of necessity, thus giving a good reserve force when required. Other precautions have been taken by way of circulars and making it necessary for settlers to take out permits for clearing, thus helping to check indiscriminate burning. In the new timber bill we hope to incorporate provisions which will considerably reduce the present cost of fire protection, and which will have for their object the conservation of the timber wealth of the province."

All for the Settler—The Lumberman Ignored

An interesting press despatch emanating from Englehart, a New Ontario town on the T. & N. O. Railway, recently told of the prosperity which awaits the energetic settler in Northern Ontario who buys a quarter-section of land from the Government. The description was an optimistic one, indicating that, for an initial outlay of about $100, a capable settler could depend upon a fairly comfortable living, with a prospect of independence in the not too distant future. The reason for this is that the land is densely covered with valuable pulpwood, and until the produce of the land is sufficient to sustain the settler, the sale of pulpwood can be depended upon to keep him in funds. An average of from $3,000 to $4,000 worth of pulpwood is found on each quarter-section.

The Government of Ontario is fortunate in possessing such fertile and valuable lands to attract settlers, and yet when one comes to consider the revenue-producing value of the timber on much of the land in Northern Ontario, he is led to question the wisdom of the policy, which, up to date, has been followed by succeeding governments. There is naturally an overlapping, in many localities, of the interests of settlers and lumbermen, and in these places the Government's duty is to see both that the lumberman receives fair play and that the settler who secures the right to cut timber is a bona-fide settler, whose presence will be a lasting benefit to the district, rather than a timber thief, whose only object is to sell the timber on the land and move along to pastures new.

Those who have not come into contact with the actual conditions prevailing in the north will not believe that men who have skinned the timber in this manner can move along and secure further permission from the Government to do the same thing over again. But this is the real state of affairs, and the timber license owner is despoiled of his own property by men whom he knows to be thieves, who know themselves to be thieves, and whom the Government, unless abnormally stupid, must also know to be thieves. Every license owner in the Georgian Bay district can cite numerous cases where fake settlers have been given the right to cut timber on limits which they (the license owners) have paid for themselves. The situation is notoriously unjust, but the Government simply snaps its fingers and asks, "What are you going to do about it anyway?" Instead of stopping this continued legalized robbery, they look to their own affairs, and impose increased stumpage dues and ground rents upon the lumbermen, at the same time saddling them with the total cost of protecting the timber from fire, a burden which the Government ought to share. Somehow or other, the lumberman is impotent in the matter. His interests seem to be of no account. Why he should be singled out for penalties on all sides is a puzzle. He is no longer able to make large profits, even though in

the early days, good profits were possible for the pioneers. These pioneers, who risked everything and denied themselves everything, were entitled to a generous measure of success; but what success they had has turned the heads of the Government and the public, who have come to consider them in the light of millionaires. It was an unlucky day for the lumberman when the term "lumber king" was coined. It did more to bias the public than any other factor. The days of lumber kings are passed. The situation of the manufacturer of lumber is in fact precarious. He must make a large profit in good business years to enable him to survive the periodical lean years. But the Government harrasses him unceasingly, and there is no possibility of laying up profits to guard against times of depression. The result is that when a bad year or two come, the manufacturer of lumber, and with him wholesalers and retailers in general, live in continued anxiety, with the chance of failure continually threatening. This may seem to be a pessimistic picture; yet there is not a lumberman in the land who will not recognize in it the picture he has been facing for many years. The Government of Ontario and the governments in general, should look to their own interests less selfishly and more patriotically in these matters of taxation, and protection against thievery. The lumber manufacturer is an asset of great importance to the country, and it would not be unwise to adopt not only a policy of conservation of our timber, but one of conservation of the rights and interests of the men who turn it into a necessary article of commerce.

Editorial Short Lengths for Busy Readers

According to Mr. E. F. Stephenson, inspector of crown timber agencies, 240,408,390 feet of lumber were cut on Dominion lands during the departmental year ending March 31 last, an increase of 58,980,930 feet over the output of the previous year. These figures are but a partial indication of the total amount cut, as many lumbermen prefer to draw their main supply of logs from their provincial holdings. In Manitoba, Saskatchewan and Alberta 943,843,098 feet of lumber was marketed last year, about half of this coming from British Columbia. The number of logs cut on Dominion lands last year is estimated at about 4,000,000 pieces. Mr. Stephenson thinks that unless some great fires sweep the Canadian forests there is a supply of timber for a great many years yet. The fire loss this year has been very small so far.

British Columbia's new Companies' Act, requiring that companies doing business in the Province shall pay a license fee, graded according to capital, from $50 to $250, has stirred up a hornets' nest of opposition. The measure was intended as a protection for British Columbia manufacturers against competition from large extra-provincial companies. It seems, according to the criticisms which have been published, that it will either be disallowed by the Dominion Government or prove something of a boomerang by inducing other provinces to enact similar legislation, aimed against British Columbia. It is interesting to imagine what would happen to the lumber trade of the Province if the markets of the prairies and Eastern Canada were cut off. It is not likely, however, that any such serious situation will be reached. The united and widespread opposition to the measure is likely to result in its being repealed after a short trial, or disallowed by the Dominion Government.

The burden of low-grade stock is again agitating the saw mill world. For a while just preceding the panic furniture factories, box factories and other consumers that work up lumber, were using practically all the low-grade the mills could supply, and not much worry was felt over its disposal. Now, however, it seems that partly because of low-grade timber, partly from the fact that the mills are cutting up the timber cleaner, and the lumbermen claim, partly because of the fact that the tariff was reduced and let in more low-grade from Canada, there is gradually accumulating more of the low-grade lumber than the mills seem able to dispose of comfortably. It will continue to be quite a problem from now on, and how much worry it may cause will depend some on the success and progress made with efforts at refining low-grade at the mill and reducing it to small dimensions of one kind and another.—The Woodworker.

Pulpwood producers will be much interested in a recent statement by John Norris, of the American Newspaper Publishers' Association, in an address before the representatives of the associated dailies of New York State. Referring to the increasing price of news print paper, he said that the manufacturers, by means of an agreement were limiting the output. "Within three years," he said, "we have had three print-paper famines. In twenty months the print paper makers of the country have kept the stock of paper on hand for all the newspapers to an average supply of less than eight days. The mill owners admit that they have produced only ninety-two per cent. of their capacity. The penalty that publishers are temporarily paying for this restriction of output and artificial stimulation of prices may be stated approximately at five dollars per ton. In New York State we are cutting timber five times as fast as it is being reproduced. If we continue, we shall not have a sawing stick left in the State in twenty years."

A scientific study of the cause of shrinkage, warping, checks, etc., in lumber, as a result of drying either in the air or in kilns, has of late been undertaken by the Grand Rapids Veneer Works of Grand Rapids, Mich., with the result that they have been able to reach an accurate knowledge of the causes of these injuries to lumber, and have produced a process of kiln-drying which turns out lumber without any of these defects. An interesting circular relating to this matter has been issued by the company, which will give the reader a very good idea of the causes of these defects and of the proper method for preventing them. Years of experimental work, with the results carefully tabulated, were necessary to enable the Grand Rapids Veneer Works to reduce their Vapor Process to an exact science. Simple but reliable methods of testing have been developed, which show the manufacturer when it is safe to work his lumber. If these tests are followed, the company claim, there is no possibility of trouble in the finished product. Glue joints, they say, become as safe a proposition as solid wood; gum dries permanently flat; oak and cypress may be resawn without fear of cupping or internal checks. Those who are interested in the drying of lumber will do themselves a service by communicating with the company and looking into the claims which they make in connection with their Vapor Process.
